997 any of our leases of so-called principal machines which prevents either these lessees or any others from doing just what Mr. Harriman says these people here are doing—that is, continuing in these instances to use the Haverhill machines, or in other instances putting in the Haverhill auxiliary machines and using them with the United Company's other machines.

In group 5 Mr. Harriman purports to set forth instances under the heading of "Users of principal machines of Haverhill Shoe Machinery Company in connection with the principal machines of the United Shoes Machinery Company." This list purports to set forth three instances in which heeling machines of the Haverhill Shoe Machinery Company are installed for use in connection with turn machines of the United Company. Or it is so stated in two of the three instances. In the third instance I find that to be the fact, although it is not so stated by Mr. Harriman. The only thing I have to say about that is that the United Company has never put out a lease for its Goodyear turn machine either on the restricted or the unrestricted basis which would preclude the lessee of the United Company's machine from taking his heeling machines from the Haverhill Shoe Machinery Company or from any other manufacturer of heeling machines and using them in connection with the United Company's Goodyear machines.

Cross-examination:

The rider of defendants' Exhibit 278 (Record, p. —) was used by the Goodyear Company before the United Company was formed, and has been used by the United Company when there was occasion ever since up to the present time. I have no means of knowing how many of those riders were used by the United Company up to the time the bill was filed.

Defendants' Exhibits 279, 280, and 281 (Record, p. —) are riders permitting the use of Goodyear machines on special kinds

of footwear. They are all three in substantially the same form, simply adapted to a kind of footwear. In the regular printed Goodyear lease the auxiliary machines and the principal machines are limited to use upon Goodyear welts and Goodyear turns, but from time to time, from the very first, some manufacturer would want to use United Company's welting machine or stitching machine, with or without auxiliaries, or some of the auxiliaries without either the welter or the stitcher, in making a special kind of shoe.

In those cases a rider has been prepared applying to the kind of shoe which the manufacturer wished to make, and a special royalty was fixed for the machines which he took. Those riders might differ in different cases, because a man might desire to use the machines in different ways in different cases, but ever since I have been connected with the company we have always had the practice of making riders to meet such conditions.

998 The rider of defendants' Exhibit 282 (Record, p. —) simply permits the removal of a machine from one factory to another and we have always done that.

Defendants' Exhibit 283 (Record, p. —) was in use as early as August, 1907. I found a lease of that date carrying such a rider, and whether it was in use before or after that I do not know. If there was occasion for it it was available up to the time the bill was filed. That rider related to the use of the outsole stitching machine and an auxiliary machine for attaching new soles after the original sole had been worn out, that is, for repairing.

I have no information as to how many of these riders were put out and I do not know of any way to get it without going through the leases.

The rider of defendants' Exhibit 284 (Record, p. —) has been used in substantially that form from the first, and the Goodyear Company had a similar form.

The rider of defendants' Exhibit 285 (Record, p. —) has been used at all times when stitchdowns were made. That kind of shoe is made periodically.

The rider of defendants' Exhibit 286 (Record, p. —) permits the use of the machine for fairstitching, and that has been permitted ever since I recall. I find instances as early as 1900.

Defendants' Exhibit 287 (Record, p. —) is a printed duplicate of defendants' Exhibit 286, which was used in typewritten form until it was called for so frequently that we had it printed. I think it was printed about 1902 or 1903.

The mock welt rider of defendants' Exhibit 288 (Record, p. —) has been in use at least since 1902, and I have no doubt it was used before that time.

999 The rider of defendants' Exhibit 289 (Record, p. —) was adopted in 1905. Prior to that time the auxiliary machines had been on the same lease with the principal machines, but in 1905, when the lease without initial payment was adopted, the auxiliaries were put upon a separate lease, and this rider for auxiliary machines was adopted at that time.

The riders of defendants' Exhibits 290 to 295 (Record, pp. ——), inclusive, were adopted in January, 1905, and were adapted to the Goodyear lease without initial payment, which was adopted at that time.

The riders of defendants' Exhibits 296 and 297 (Record, p. —) were prepared in 1908 and used originally in typewritten form. They were printed in 1910.

The riders of defendants' Exhibits 298 and 299 were adopted in typewritten form in 1905 and were printed in 1906.

The rider of defendants' Exhibit 300, which is the one striking out the restrictive clauses in the metallic lease and providing for an initial payment, was adopted in September, 1910. Prior to that time we had always offered metallic machines upon two forms of lease, one with the restriction and one without. The restricted lease called for a smaller return to us in the way of royalty than the one without restriction. When this rider was attached to a lease the lessee paid us an initial payment when the machine was installed, and this rider was attached to the regular restrictive form of lease and struck out the restriction in that lease which limited the metallic machines to use with our Goodyear welting and stitching and our lasting machines.

The initial payment varied on different machines. A letter which I have, dated September 2, 1910, written to a manufacturer inquiring for such terms, quotes initial payments upon machines of various departments, including metallic machines. The terms named for the metallic machines were as follows: Staple fastening machine, initial payment $100; slugging machine, initial payment $250; loose nailing machine, initial

1000 payment $250; string nail tacking machine, initial payment $75; taper nail tacking machine, initial payment $75.

As to whether those amounts were the consideration for striking out the tying clauses, I would not put it that way. The lessee could have the metallic machines upon the restricted form of lease without any initial payment; he could have the machines upon the unrestricted form of lease, provided he cared

to pay us ten per cent more for the fastening material; he could have them upon the unrestricted form of lease, provided he paid us this initial payment in respect to each machine at the time they were installed. If he elected to take the last alternative, the rider which you have in your hand was attached to the restricted form of lease, and the lease was modified by that rider striking out the restrictive clauses. And in that case the ten per cent increase in the price of material did not apply. He bought his material at the same price as the man who had the restricted form of lease.

BROWN, J. He had his choice of three ways?

The WITNESS. He had his choice of three ways.

The rider of defendants' Exhibit 302 (Record, p. —) was a form making the leases available to small manufacturers, waiving the guaranty and substituting a small annual rental. I found such riders in use as early as 1902 and it has been used as occasion arose ever since.

Defendants' Exhibit 303 (Record, p. —) was simply a letter to some enquiring lessee who wished to have his lease interpreted in some respect. I don't imagine it was used in any case but one. The one which I brought in was a copy of an original lease with the rider attached to it I didn't look up to see whether it was used in other instances, but that letter was adopted as a form and if any one else made the same inquiry he got the same form of letter.

The rider of defendants' Exhibit 304 (Record, p. —) was used in a good many cases. I have found instances as early as 1903 and whether there were others before that I do not know.

Defendants' Exhibit 305 (Record, p. —) was a letter which really amounts to a rider and has always been used. When lessees desire to return part but not all of the machines under a particular lease, before the expiration of the lease, this rider is attached to the lease, indicating that those returned machines are eliminated from the lease.

1001 The rider of defendants' Exhibit 306 (Record, p. —) was adapted to the pulling over system lease and was similar to the rider for the metallic lease; that is, it struck out the restrictive clause and substituted initial payment. My recollection is that the initial payment was $750 for the pulling over machine, which is a very large heavy machine, and that the initial payments for the auxiliary machines were smaller amounts. $750 was not the consideration for striking out the restrictive clause; it was the initial payment if the lessee desired to take the machine upon the unrestricted form of lease.

Defendants' Exhibit 307 (Record, p. —) was simply a letter interpreting the lease for some lessee who had inquired.

The rider of defendants' Exhibit 308 (Record, p. —) was a form to be attached to the heeling department lease, changing it from a restricted lease to an unrestricted lease, involving initial payment and elimination of the so-called tying clauses. The initial payments were—for the McKay automatic heel loading and attaching machine, $400; trimming and randing machine, $150; heel trimming machine, $150. Those prices were quoted in September, 1910, to an enquiring lessee.

Defendants' Exhibit 309 (Record, p. —) is a printed form of rider corresponding to the typewritten form of defendants' Exhibit 308.

It was generally known among the trade that lease conditions would be given to permit these various things, although I don't suppose the trade knew how the terms would be given, whether by a form of lease or by a lease with modifications, and I don't suppose they concerned themselves as to that. We used riders simply as a matter of convenience and then if we found there was frequent use for it we printed a new lease, incorporating the rider in the lease.

1002 One illustration of the manner in which information that these lease conditions would be given was conveyed to the trade is that the form of royalty report which we have used ever since the United Company was formed contains blanks providing for fair-stitch work, mock-welt work, McKay-welt work, and so on, so that the return which every lessee of the Goodyear machines makes, who has a stitching machine, has such blanks on it. They make that sort of a return. That is one illustration. Of course, there are many others.

I think I have produced types of all the forms of rider which have been used.

With respect to the list put in by Mr. Harriman, I do not find in groups 1 or 2 any instance where Mr. Harriman stated that the manufacturer had our machines when he did not.

As to group 3, Mr. Harriman stated that the manufacturers enumerated were users of Haverhill Company machines, having no principal machines of the United Company excepting in the instances enumerated. Without looking it up I knew that in the two cases which he named in which United Company machines were used, the manufacturers did have our machines. I didn't investigate to see whether any others had our machines.

As to group 4, Mr. Harriman does not indicate anything with reference to the United Company's machines, and I did not look that up.

As to group 5, without having looked it up I am certain that both Witherell & Dobbin, J. J. Grover & Sons, and the Wingate Shoe Company have other machines of the United Company beside the turn machines mentioned, but as Mr. Harriman said that they were using turn machines, I did not consider it necessary to go further.

Mr. FOWLER. Mr. Brown has returned with this list that I called for the other day. Your Honors will remember that Mr. Winslow had filed a list showing the various machines that were in use at Mr. Brown's factory. Mr. Brown has returned and has designated the various sources from which he obtained those machines, and I don't care to ask him any further questions about it.

(Amplified list of machines used by J. Brown & Sons, Salem, Massachusetts, showing sources from which the machines were obtained is plaintiff's Exhibit 269, Record, p. —.)

1003 JANUARY 9, 1914.

WILLIAM R. SAMPSON, witness for defendants (recalled).

I am sales manager of the general department of the United Company, and have occupied that position for seven or eight years.

In connection with my work I have always made it a practice as far as possible to keep myself informed as to the state of the art as to the supply of shoe machinery on the market by others than the United Company. I inform myself as to what other persons are in the business and as to what they are offering in the way of machinery. That is a part of my trade knowledge and I always keep a file of catalogues that are issued, the different advertisements that appear, and general information that I obtain through reports, etc.

I have brought together my information with reference to the people who were advertising as producing shoe machinery and offering it to shoe manufacturers prior to December, 1911. This information has been compiled in two portfolios, of which the first comprises letters, catalogues, and advertisements of different machines that are offered for sale and advertised in this country by manufacturers of shoe machinery. There are 116 manufacturers represented in that portfolio, which is defendants' Exhibit 321 (a physical exhibit). That portfolio contains an index both according to the names of the manufacturers and according to the operations of the machines. All of these concerns are still engaged in business.

The second portfolio comprises catalogues of machines which I have not seen specifically advertised within a few years, but

which were generally known to be those of manufacturers who have these machines for sale, as a matter of general trade knowledge. I have collected there their catalogues which they give out to the trade. This portfolio is defendants' Exhibit 311 (a physical exhibit).

To inform myself further as to whether these people who were advertising were, in fact, ready to supply the machines which they advertised for sale or lease, I obtained letters from them saying that they were in a position to supply the machines. I personally applied, or had people apply personally, to them for the information. I have their own letters in response, quoting prices and giving their circulars and catalogues showing the machines upon which they quote. Their answers and some of their advertisements and catalogues are in the first portfolio. The letters are not all dated before December 11, 1911, but it is general knowledge that the machines were offered for sale before that time.

1004

I also produce a number of loose catalogues which I was not able to get into this portfolio. Defendants' Exhibit 312 (a physical exhibit) is a catalogue of Edward D. Spencer & Company. Defendants' Exhibit 313 (a physical exhibit) is a catalogue of J. D. Randall Company. Defendants' Exhibit 314 (a physical exhibit) is a catalogue of Edwin B. Stimpson & Son. Defendants' Exhibit 315 (a physical exhibit) is a catalogue of Metropolitan Sewing Machine Company. Defendants' Exhibit 316 (a physical exhibit) is a catalogue of C. V. Engstrom Company. Defendants' Exhibit 317 (a physical exhibit) is a catalogue of A. Johnson & Sons. Defendants' Exhibit 318 (a physical exhibit) is a catalogue of Moenus Shoe Machine Company. Defendants' Exhibit 319 (a physical exhibit) is a catalogue of Atlas-Worke Pohler & Co. Defendants' Exhibit 320 (a physical exhibit) is a catalogue of Standard Rotary Machine Company.

Mr. FOWLER. Of course, we want to interpose an objection, your honors, to all concerns mentioned in this list who are not engaged in producing or putting upon the market machines connected with fastening the sole to the shoe. This relates purely to the question of the monopoly. We are not insisting that there is a monopoly of any other line of machinery except that.

Mr. CHOATE. Do you waive any other claim?

Mr. FOWLER. So far as the actual monopoly is concerned, it is limited to the machines fastening the soles and the uppers together, and to the clicking machines and the eyeletting machines. Mr. Gregg says he wants to state it.

Mr. GREGG. Machines for preparing and attaching the bottoms to the uppers of shoes, and eyeletting machines and dieing-

out machines, otherwise known as clicking machines. Machines for preparing and attaching the bottoms to the uppers of shoes, eyeletting machines, and clicking machines.

1005 BROWN, J. On what ground do you object to the introduction by the defendants of matters responsive to the allegations of the bill as it now stands?

Mr. FOWLER. We submit, may it please the court, that it is not responsive to the allegations of the bill as it now stands. It is true the bill alleges that it was their object to monopolize other lines of machinery than those, but the bill further restricts the actual monopoly to those particular lines that Mr. Gregg has mentioned, and we submit the fact that there are other concerns existing that put out machines of another character is not related to the allegations of the bill, as now set forth in the bill.

Mr. CHOATE. I don't think the bill does limit it in any way to the machines of which you have now spoken.

Mr. FOWLER. If the bill does not limit the actual monopoly to those machines as mentioned, why, we will agree to limit it at the present time.

DODGE, J. Page 73 certainly doesn't limit it that way.

Mr. GREGG. Seventy-nine, if your honor please.

Mr. FOWLER. I want to draw a distinction between the two matters alleged in the bill. The bill alleges that it was their original intention on the formation of the company to monopolize other lines of machinery, but when the bill comes to allege, make an allegation, with reference to the actual monopoly, it is limited to these particular machines. Your honors, I am sure, will find that that is the case, if you will examine the bill closely.

DODGE, J. Paragraph 8, on page 73, doesn't seem to look like that.

Mr. GREGG. Well, on page 79, section XI, of the bill reads:

"By virtue of the unlawful contracts and combinations above described defendants control all the large and important establishments in the United States which were formerly engaged in the manufacture, sale, and lease of machines designed and used for attaching the bottoms to the uppers of boots and shoes, and kindred and auxiliary machines; they have obligated scores of successful shoe machinery men to refrain from trade and commerce therein and have acquired a monopoly of interstate and foreign trade and commerce in shoe machinery, and have become so powerful that successful competition therein with them by any concern is practically impossible. The extent of their monopoly is indicated by the fact that they now control more than 98 per cent of the manufacture, sale, and lease of all the

essential and kindred and auxiliary machines and devices manufactured and used in the United States for attaching the bottoms to the uppers of boots and shoes; and they have it within their power," etc.

The paragraph on page 73, to which his honor, Judge Dodge, refers, is under the section of the bill relating to domination by defendants of foreign trade and commerce in shoe machinery, that is, between this country and foreign countries.

PUTNAM, J. Do you admit that you don't claim a monopoly in trade and commerce, either in the United States or foreign countries, of anything except the bottoming machinery and the eyeletting machinery?

Mr. GREGG. Machines for preparing and attaching the bottoms to the uppers of boots and shoes, the eyeletting machines and the clicking machines, and, as I stated, when I opened the case for the Government——

PUTNAM, J. One moment. Do you admit that that is all you claim?

1006 Mr. GREGG. Yes, sir. We make no contention——

PUTNAM, J. Can that go in the record?

Mr. GREGG. Yes, sir; I am perfectly willing for that to go in the record.

Mr. FOWLER. It has gone in the record, your honors, several times.

PUTNAM, J. Well, I don't know. In my opinion I said it was a very frank bill. So it was a very frank bill. At the same time they needed to determine the lines on which it is marked, but if you admit that and have it go in the record, why isn't that just as good as though you alleged distinctly in the bill that you claim that and nothing more? What would be the necessity of going into it?

Mr. GREGG. As Mr. Fowler has stated, perhaps the bill may be open to the construction that we allege an intent to monopolize more than those machines, and I think the proof all the way through will show that, taking into consideration the agreements that they entered into at the time they acquired competing concerns.

PUTNAM, J. Then that is a part of your case. If you allege in the bill that they intended to monopolize the whole thing, that gives color to the bill all through, doesn't it?

Mr. GREGG. Only to that extent; but when we charge the actual monopoly of what they have actually monopolized we charge that they have monopolized the machines that are designed and used for preparing and attaching the bottoms to the uppers of shoes.

PUTNAM, J. If I remember correctly, in the Swift case the intention was made the turning point of the case. If they had done these things, if you will still allege that they had done these things with the original intention to create a monopoly in other things, isn't that a case under the statute?

BROWN, J. Irrespective of the question of what had in fact been monopolized, that would give the Government a ground for decree on these general allegations.

Mr. FOWLER. Now, the bill sets out these facts, as I construe the bill, that, first, they intended to monopolize the whole business; in the second place, that they didn't monopolize the whole business, but in carrying out that intent they mopolized certain branches of the business.

BROWN, J. That is the trouble.

Mr. FOWLER. Yes.

DODGE, J. Haven't you alleged in your bill that everything they did hereinafter set forth was a step in carrying out the unlawful intent?

Mr. FOWLER. That is correct. Of course, your honor, we do that, but the bill expressly—that is, by necessary implication—admits that in these other lines of business there are a number of people at least engaging. That is what he is attempting to prove here; that is, he is introducing a list of a great many concerns engaged in those particular lines of business which the bill admits haven't been monopolized at all. Now, what additional bearing can that have, or how can that add anything to what is actually admitted and alleged in the bill itself?

BROWN, J. Mr. Gregg stands with Mr. Fowler on the original charges of the bill, a conspiracy to monopolize the entire shoe machinery business.

Mr. FOWLER. That is, when the organization was first made.

BROWN, J. Now, is it not open to the defendants to show what that was?

Mr. FOWLER. Certainly, your honor. As I understand, this particular evidence does not relate to what actually occurred.

BROWN, J. It certainly must be open to the defendants to show what was the field that they have made no attempts, and haven't tried to, in other lines at all. So long as you insist upon the original position, I don't think that the allegation that you charge success in any particular line is of any consequence.

1007 Mr. FOWLER. Of course, your honors, it can't have any material bearing upon the question of the actual monopoly, because we can see the actual monopoly only extends to a certain limited field.

Mr. CHOATE. State those fields, won't you?

BROWN, J. Even if it could be found that there is no actual monopoly as to bottoming machines, there is yet a case for decision.

Mr. FOWLER. That is correct, may it please the court, and the only questions for your honors to consider, it seems to me, is whether or not the simple fact that here were a number of other concerns engaged in other lines of business in 1911, or some time previous before 1911, can add anything to what is admitted in the bill with reference to those particular facts. That is, while the bill alleges that there was the original intent to monopolize when the organization was formed, yet it concedes there were a number of concerns in other lines of business than those particular lines, and those lines were not actually monopolized. Now, if these facts can add anything to what is alleged that are admitted in the bill on that feature, then it is admissible; but of course it could go only to the question of original intent; that would be the only thing.

PUTNAM, J. We haven't got foresight enough to go through all this. We have generally let counsel put in everything they wanted to, and I guess we had better let them go on the same way now.

Mr. FOWLER. I suppose, your honors, our exception may be noted?

PUTNAM, J. Certainly. Do you desire to state it any more fully?

Mr. FOWLER. No; I don't care to, your honor. Of course, there is a lot of testimony of the same kind put in by Mr. Winslow. I believe I raised some objection at that time that wasn't pressed.

(At request of counsel for petitioner the witness agrees to prepare a list of the manufacturers whose catalogs, letters, advertisements, and circulars relating to shoe machinery comprise defendants' Exhibits 311 to 321, inclusive, and of the machines which they manufacture.)

1008 JANUARY 9, 1914.

SIDNEY W. WINSLOW, witness for defendants (recalled).

Cross-examination resumed:

I was requested to ascertain if I could what per cent of welt shoes was lasted by machinery in 1898. I have ascertained that in 1899, 19,000,000 pairs of shoes were lasted on the Chase and Ideal machines, and I assume that those were all welt shoes. That is the nearest that it is possible for me to get. There is

nothing in our records to indicate whether the shoes are of one kind or another, except the kinds of machines that are used on them.

As to the number of welt shoes that were being manufactured at that time, I think it was 23,000,000. I have testified to that, and haven't the exact figure here. As to whether there is anything to indicate whether or not the Consolidated hand method lasting machine was being used in lasting welt shoes at that time, I haven't attempted to get the work done by each particular machine. It would be quite a task, although I might do it as regards the hand method machines.

I was asked to ascertain the style of the infringement cases which were pending against the Seaver Company and which had been brought by the Consolidated & McKay Company. Those suits were equity No. 1158, Consolidated & McKay Lasting Machine Company *v.* the Seaver Process Lasting Machine Company, and equity No. 1167, Same *v.* Same. They were both pending in the Circuit Court in the District of Massachusetts, and Fish, Richardson & Storrow were our counsel.

As to the request that I ascertain the number of Eppler machines which had been returned to our factory, the records of the factory do not show and I have not yet been able to get the information. I don't know whether I can get it. There 1009 have been so many things and so much work that I have followed along the lines of least resistance to get such facts as you asked for.

I have not yet ascertained the capital stock of the Eppler Welt Machine Company. I have tried to find records which would give that information, but have not yet found them. I do not know what has become of the records of the Eppler Company. I never saw them, and do not know whether they ever came into the possession of the United Company. I think the main office of the Eppler Company was in Boston or Brockton, but I do not know. Let me say that of course I was connected with the Lasting Machine Company and the McKay Company was located across the street, and the Goodyear Company's office was near ours. As soon as the companies were brought together of course my mind was entirely upon other matters than such things as the records of the Eppler Company, and then I went abroad in May or June, two or three months after the formation of our company, and did not return until late in the fall, and was out of touch with many of the details of the business until my return. I assume that the records of the Consolidated & McKay Company and the records of the Good-

year Company were turned over to the United Company, but I have never seen them. My work has not brought me in touch with them.

As to who prepared the papers and looked after the details of the purchase of the Eppler Company, beyond the fact that Mr. Endicott negotiated the sale, I can't give any information. It should be remembered that this transaction took place about fifteen years ago, and my mind has been occupied with the business of the three main companies and such companies as continued their existence, like the Canadian Company.

Fish, Richardson & Storrow were attorneys for the Eppler Company. I do not know whether they or whether Mr. Storrow had anything to do with the Eppler transaction. I think I had nothing whatever to do with the details of the transaction beyond what I have already stated in my previous testimony.

I have not yet undertaken to file a list showing what heeling and metallic machines were being made at the time of the consolidation of the several companies into the United Company other than those made by the McKay Shoe Machinery Company. I did not understand any such request was made of me. I will try to have that for you next week.

1010 I have prepared a statement giving the initial payments received on Goodyear department auxiliary machines in the calendar years 1903, 1904, 1905, and the amounts of the annual rentals for machines that were placed on the rental basis in the calendar year 1905, that being the first year that we started to put out auxiliary machines on the rental basis. Initial premiums received upon Goodyear department auxiliary machines in those years were as follows: 1903, $78,390; 1904, $92,510; 1905, $13,988.

In 1905 part of those machines were put out on the initial premium basis and part on the rental basis, the manufacturer exercising his choice. We adopted the rental basis late in 1904. In the year 1905 the annual rental upon the Goodyear department auxiliary machines which were put out upon that basis amounted to $15,371. If those machines had been put on an initial payment basis, we would have received $274,582 in initial payments. As requested, I will obtain the figures for 1911.

As requested, I have obtained information showing the amount received from repair parts and the profits on those parts. For the calendar year ending December 31, 1911, the total gross sales of parts for the Goodyear, heeling, lasting, pulling-over, and metallic department machines amounted to $690,367.34. The gross profit on those sales, without deduction for interest on capital invested or loss resulting from parts becoming obsolete, was

$276,146.94. The cost of the road service for that year, ending December 31, 1911, was $1,198,111.51. That road service expense includes generally the salaries and traveling expenses of roadmen, the proportion of the rents and expenses of the stations throughout the country, and telephone charges and expenses attributable in our accounts to road service alone. I can not give the details from memory. I think I went into those more in detail on direct examination, but I haven't the data with me. As requested, I have designated the sixteen auxiliary machines referred to in defendant's Exhibit 230 (supra, p. —). (The list supplied by Mr. Winslow is filed as plaintiff's Exhibit 270, Record, p. —.)

1011 I have ascertained that the list of 746 new concerns which have entered the shoe manufacturing business since 1900 was confined to manufacturers with whom our company did business. We did not attempt to ascertain how many concerns had entered business with whom we had not done business.

As requested, I have prepared the following lists:

(1) A list of the total number of lessees holding machines of the Goodyear, lasting, heeling, or metallic departments of the United Company on January 1, 1905, on independent, unrestricted leases. (This is plaintiff's Exhibit 271, Record, p. —.)

(2) A list of the total number of shoe manufacturers holding machines of the Goodyear, lasting, heeling, or metallic departments of the United Company on January 1, 1905, on independent, unrestricted leases. (This is plaintiff's Exhibit 272, Record, p. —.)

(3) A list of shoe manufacturers holding machines of the lasting, heeling, or metallic departments of the United Company on January 1, 1905, on independent, unrestricted leases. (This is plaintiff's Exhibit 273, Record, p. —.)

The total number of lessees on the first list holding Goodyear, lasting, heeling, and metallic department machines on independent, unrestricted leases is 1,085. The total number of shoe manufacturers on the second list holding machines of the Goodyear, lasting, heeling, and metallic departments on January 1, 1905, on independent, unrestricted leases is 943. The shoe manufacturers on the third list holding machines of the lasting, heeling, or metallic departments, on independent, unrestricted leases is 706. On January 1, 1905, the United Company was doing business with 1,026 shoe manufacturers, so that 943 of the 1,026 manufacturers had one or the other independent lease.

These lists give the names of the several individual concerns who held one or more machines under the independent leases on that particular date. These lists do not show the particular

machine or machines that were held by a lessee under this lease. That would be an almost interminable task. As to whether more or fewer manufacturers held machines under independent
1012 leases in December, 1911, I don't know, but I should assume that there would be fewer, because shoe manufacturers have appreciated the advantages of taking machines on restricted leases and have gradually adopted that plan. If it is a fact that more manufacturers are now holding restricted leases, that may be due to various conditions. For example, one manufacturer may go out of business and another manufacturer might enter business who would decide to take machines on the restricted leases. Again, a manufacturer would give up the use of machines, like the Chase machine, as in the case of C. H. Jones, of the Commonwealth Shoe and Leather Company, who had a great many Chase machines on unrestricted leases. He returned those machines and took the No. 5 lasting machine on restricted leases rather than take them on the unrestricted, independent leases.

In regard to the list of machines in the Brown factory, the United Company manufactures the Amazeen skiving machine and the Pluma skiving machine. I think the Pluma machine is a new machine that we have got out, but of that I can't be certain. If Jonathan Brown has those machines in his factory he did not necessarily get them from us, as we sell those machines and never lease them.

Our company now controls the Booth Manufacturing Company and we purchased the assets of George W. Emerson & Company. The Bresnahan Machine Company was a part of the property of Thomas G. Plant, and when we acquired its property it was not doing any commercial business.

(Examination of Mr. Winslow suspended, at request of counsel for defendants, to accommodate the next witness.)

1013 JANUARY 9, 1914.

ARTHUR AUGUSTUS SOUTH, witness for defendants.

I reside in Beverly, and I am superintendent of the Brophy Brothers Shoe Company, of Lynn. I have been in that position for eight years.

Every machine that enters our factory has to be approved by me; that is a part of my duties.

As to the testimony of Aleck Stone that he represents the Atlas Works, of Leipsic, Germany, and that in January or February, 1911, he called at the factory of Brophy Brothers in Lynn and interviewed the superintendent, and endeavored to place some of his machinery in our factory, and that he was told by the superintendent that they could not take any of his

machines, and that the superintendent said: "Mr. Stone, we can't even talk aloud about it, about talking with you at all about competition machines"—I did not make the statement. In the first place I don't know Mr. Stone and I never met the gentleman. I made no such statement.

There is no other person in our factory who has anything to do with meeting men who want to place machinery.

Cross-examination:

I never remember of meeting Mr. Stone in any way, shape, or manner.

1014 JANUARY 13, 1914.

NELSON W. HOWARD, witness for defendants, resumed.

Cross-examination:

There has been final judgment in each of the interferences between patent applications owned by the United Company and applications owned by Mr. Plant enumerated by me in defendants' Exhibit 272. These judgments were as follows, the ownership of the applications being indicated by "(United)" or "(Plant)":

Interference, No. 28,127, was decided in favor of Heys (Plant); No. 31,306 was decided in favor of Eppler (United); No. 31,422 was decided in favor of Heys (Plant); No. 31,657 was decided in favor of Phelan (Plant); No. 31,005 was decided in favor of Winkley (United); No. 29,382 was decided in favor of Ladd and Stiggins (United); No. 32,078 was decided in favor of Busell (United); No. 31,965 was decided in favor of Keats (United); No. 31,966 was decided in favor of Ashworth (United); No. 30,644 was decided in favor of Heys (Plant); Nos. 26,952 and 27,259 were decided in favor of Krewson (That application was owned by neither Plant nor the United when the interference was declared, but Plant had a license under the issues of the interference); No. 26,016 was decided in favor of Flynt (United); No. 26,018 was decided in favor of Hadaway (United); No. 31,802 was decided in favor of Brock (United); No. 31,347 was decided in favor of Phelan (Plant); No. 29,751 was decided in favor of Cook (whose application was owned by neither Plant nor the United); No. 31,525 was decided in favor of Hadaway (United); No. 31,854 was decided in favor of Hadaway (United); No. 28,636 was decided in favor of Perry (United); No. 32,056 was decided in favor of Stewart (Plant); No. 32,021 was decided in favor of Towle (United); No. 32,201 was decided in favor of Buckminster (United).

The only interference that I recall that was disposed of by stipulation was No. 32,056, McFeely v. Stewart. Stewart had

previously won another interference and was several years ahead of McFeely.

1015 I do not think that all of the interferences were decided before the Plant acquisition; those that were declared within two or three months before the acquisition very likely did not get to a final hearing before the date of the acquisition. It did not follow that after the acquisition we did not carry any further the interferences that had not been decided. It is sometimes necessary to carry through an interference in order to have the Patent Office settle the question of priority.

My recollection is that in the majority of those interferences which had not been decided before the Plant acquisition we carried the interference through. We certainly did in those cases where there were other parties, and there were quite a number of applications not owned by Plant or the United. I think enough progress had been made in the other cases so that it was advisable to carry them to final adjudication by the Patent Office.

Referring to defendants' Exhibit 274 (Rec., p. —) which sets forth my opinions as to infringements of Plant patents by machines of the United Company, the statement at the end of the discussion of Lockstitch Machine—model K, that it was necessary to change the construction of the machine to avoid infringement, applies only to the last patent mentioned in that discussion, No. 940,055.

1016 Referring to the discussion of lasting machine: No. 5, in defendants' Exhibit 274, and particularly to the paragraph regarding the British patent, some of the claims of which our machine infringed—at that time the United States patent had not been issued, but we felt sure that there was a United States application pending, and we made our changes in the light of what we found in that British patent. We expected to find the same claims in the United States patent when it issued later on as it did a year or two after that.

Referring to the last paragraph of the discussion of lasting machine: No. 5 in defendatns' Exhibit 274, we changed the construction of our experimental hold-down to avoid the infringement of claim 24 of patent No. 957,949, May 17, 1910, Glass, and claim 51 of patent No. 958,280, May 17, 1910, Plant; but it is not correct at all to state that at the time the Plant patents were acquired there was no infringement with respect to patents No. 957,949, Glass, and No. 958,280, Plant, because that last paragraph has to do with claim 24 only of patent No. 957,949 and of claim 51 only of patent No. 958,280. As ex-

plained in the earlier part of that discussion, the commercial machine infringed five other claims—13, 14, 15, 16, and 18—of patent No. 957,949, and it infringed five other claims—46, 47, 48, 50, and 52—of patent No. 958,280.

In the same discussion, in defendants' Exhibit 274, by my statement, in connection with the infringement of claims 46, 47, 48, and 50 of patent No. 958,280, that "the validity of those claims is questionable." I meant that I hoped it would be found that those claims were invalid if they were sued upon.

1017 As to our opportunities for determining whether or not Plant machines infringed our patents, prior to the time that we went through the Plant factory we got great assistance from the Plant patents and from the manner in which they were issued. The patents on the machines he was using issued to him and the patents on the inventions he was not using issued to the Manufacturers' Machine Company.

Q. Then all the suits you brought prior to the Plant acquisition were based on an examination of the patents only?

A. Oh, no. We learned from one source and another, operators who had been employed in the Plant factory who had drifted into our branch offices, and in that way we were able to learn which of the patents—we got enough information as to the general character of the machines so that we could tell which of the patents——

Q. In other words, the operatives of the Plant machines reported to your office on the operation of those machines?

A. Well, we got in touch with them. Our branch office would report to us that somebody would come in and give them this information about a certain machine, and by piecing together the information we got, that we got from all sources, we were able to satisfy ourselves as to the actual construction of the Plant machines.

None of the 18 infringement suits brought against Plant or the Thomas G. Plant Company had been litigated to a final conclusion. The first suits were brought in July, 1910.

I was aware before the Plant acquisition of the infringements by the Plant machines of practically all the United Company's patents which I have mentioned, except the Bresnahan sole molder infringement. I did not happen to see that machine in the Plant factory. I have stumbled on a few infringements since the acquisition.

I am not aware that Plant had notified the United Company that he intended to bring suits for infringement.

1018 Referring to defendants' Exhibit 275 (Rec., p. —), it is not claimed that United Company's machines were infringing any patents owned by the Goddu Company. The infringements there discussed were infringements by the Goddu Company machines of the United Company's patents. The proposed suits for infringements referred to in that exhibit had been prepared just before the formation of the United Company, and at that time the patents were owned by the McKay Metallic Fastening Association.

There was no infringement by the United Company of patents owned by Coupal and Gordon.

No suits had been brought by the United Company against Edwin T. Freeman for infringement of its patents by his machines. We claimed that there were such infringements. As a matter of fact, Freeman had not put out any machines at all.

As to all the concerns named in defandants' Exhibit 275, it is a fact that, except where infringement suits had been litigated to a final conclusion, my statements as to infringement are merely statements of my opinions.

There are also cases in which no infringements were claimed. Those are comprised in two groups; first, cases where a new field which we desired to enter—for example, the fast color eyelet field—was in our opinion completely dominated by patents owned by the acquired company; second, where the acquired company had patent rights which stood in the way of the development of machines which we had under way or which we were actually putting on the market. One of the companies in this group was the Seaver Lasting Machine Company, which, however, was also infringing our patents.

The suits under the discussion of M. V. Bresnahan & Co. in defendants' Exhibit 275, were not patent suits, and were cited simply to show that there was litigation pending. The first group were actions of replevin, and it is my impression that the suits were brought to recover certain machinery that had been in a fire and had been sold after they had been taken over by an insurance company. The facts are all of record in the report of the suits in 197 Massachusetts, 206.

1019 While I can not state the details of the four suits brought by the Bresnahan Company against the United Company, my impression is that they were for alleged malicious prosecution. These suits were pending at the time of the acquisition, and were disposed of by stipulation or by oral agreement after the acquisition.

Direct examination resumed:

As to the peculiarities of leather which must be provided for in the machinery which operates upon it, as distinguished from the machinery used on manufactured fabrics, leather is unique in that different portions of every skin or hide, frequently portions that are closely adjacent, differ in hardness, elasticity, and thickness, and these differences all have to be reckoned with throughout the successive steps in the manufacture of the shoe. For example, in cutting the different parts of the upper from a skin the cutter must be constantly examining the skin, selecting the best parts for the portion of the upper which will receive the most wear, and cutting from the other parts of the skin the portions of the upper which receive less wear or are not so prominent in the finished shoe. The necessity for that constant examination and the exercise of his best judgment all the time by the workman probably explains why the operation of cutting out uppers was always performed by hand until as late as 1908.

Again, in manipulating hide of sole leather, the operator must cut out soles from the best portion, carefully avoiding soft spots and brand marks, while insoles come from a different portion, not satisfactory for outsoles, and counters and top lifts and the other heel lifts are cut from the poorer portions.

Further, a shoe is unique in that it comprises so many different parts of leather. The upper of light skin, comprising a number of different parts, has within it a cloth lining. Between the lining and the upper is inserted a sole leather counter at the heel, and at the toe of most shoes a stiffening piece, known as the box toe, which prevents the toe from breaking down in wear.

1020 Then there are the insole and outsole, both of sole leather; in a welt shoe, the welt and also a filler of cork and cement between the sole and the outsole. The heel, if all leather, is composed either of whole pieces of leather, or if it is a pieced heel, many of its lifts will be composed of pieces of scrap leather pieced together to form complete lifts.

In my study of the development of machines for operating on leather to make shoes I have observed that only those machines have survived in connection with which the peculiarities of leather, of which I have just given illustrations, have been kept in mind.

1021 JANUARY 13, 1914.

SIDNEY W. WINSLOW, witness for defendants (resumed).

Direct examination resumed:

On cross-examination I was asked what, if any, new principal machines had been developed since 1899. Understanding the question to be limited to a machine which had been developed

to do work which had previously been done by hand, I referred only to the pulling-over machine. As I now think the question was intended, my answer should have included the clicking machine, the No. 5 lasting machine, the model M stitcher, and the model K welter. I include the last three machines because they are entirely new machines from the ground up; while they perform operations that were previously done by machines, they all embody new principles. There are also the new model B heeling machine and the new loose nailing machine, which have all been built upon new models. I mean by that that, although they accomplish in a general way the same result, it is an entirely new machine for accomplishing that result.

On cross-examination I was asked about the Continental laster. I have investigated that machine, and the best information I can get is that not over 20 of them were ever put out, and that those went out of use before the United Company was formed. As I stated, it was nothing but a tacking machine; the lasting was done by hand and the machine drove the tack.

When I stated on cross-examination that there were a vast number of metallic machines on the market before 1899, I understood the question to refer to the fact that a large number of metallic machines were in use, rather than many types of machines. As regards different kinds or makes of machines, there were not a great many in 1899 and practically all were being made by the McKay Company, which was putting out a large number of those machines.

My best information is that the McKay Company was putting out all the heel-attaching machines that were being put out in 1899, and that no other company had put out any heel-attaching machines for quite a number of years prior to 1899. When I speak of a heeling machine I mean a heel-attaching
1022 machine always. In speaking on my cross-examination of the Goddu Company having three or four types of machines I did not mean that they were in a position where they were marketing any machines. They were not in a position where they were marketing any machines, and were not in a position to market any machines. My information is that there never had been but one of their machines put out, and that that was only in use for some two or three weeks and had been returned to the company. On the question of their commercial condition, there were two of their machines that were not, and would not have become, commercial because of the feed that was used in them. They were all imitations of or along the same line as the machines that Goddu, senior, had invented for

the McKay Company. The machine which had gone out and been sent back was not as fast, and therefore not as commercially valuable as the machine which Goddu, senior, had invented for the McKay Company for doing that work.

As to the demand among shoe manufacturers for the McKay & Copeland laster and the Chase laster, about 1899 and just before and following 1899, the field for the McKay & Copeland has always been limited. I think there never have been over 300 of those machines in use at any time, and at present there are less than 200 in use. The Chase machine was substantially stationary in 1899; that is, for two or three years as many machines were returned as were put out. It would be fair to say that the use of that machine did not increase. Of course, at present there are very few of them in use.

In regard to the company's policy in offering or allowing manufacturers to take forms of leases alternative to those put in by the United States on those two kinds of machines, and particularly as to its policy in respect to the use of the old type of lease that had been used by the Consolidated & McKay Company before 1899, any manufacturer could have obtained those machines on the old types of leases. I think a careful examination of the development of the leases will show that some reduction, either in royalty or some beneficial change had been made in the new lease when any limitation was put into it.

A great many of those machines of these two types that were out remained out on the old form of lease. Of course the policy of the company in dealing with the manufacturers and talking with them was always to say to them, if one of these leases was discussed, that if they found any bother there, that we would be very glad to take up the matter with them and issue to them new leases under either the old terms or conditions that would make it equitable for them to use the machines.

1023 In regard to the vote passed by the company in reference to rebates of royalties on certain machines, that vote when passed was intended to apply to the Gem insole situation and nothing else, and was in practice applied to nothing except the Gem insole machines. Many machines had been put out by the Gem Insole Company before we acquired the machines, and it was necessary to have a general vote to apply to the machines already out on lease as well as those that might be put out. That was the purpose of the general vote, and no discrimination whatever was practiced between our customers in pursuance of that vote.

With reference to my testimony on cross-examination that in the calendar year 1911 our road service cost us $1,196,000 and our gross profits on parts were $276,000, without deducting anything for interest on capital and loss on obsolete parts, the capital tied up in the parts that are spread around through the agencies and at the home factory is a very large sum. I can not give the figures offhand. I should suppose that it would be in millions, but I would prefer to investigate it.

The loss from repair parts that are manufactured and are never used because they become obsolete runs into the thousands each year, and is a serious factor.

With respect to the $276,000 of gross profits, we are under annual expense which is not charged to our customers for putting the returned machines into condition for use. In 1911 the net cost of repairing the Goodyear, heeling, lasting, pulling over and and metallic machines at our factory, in excess of the charges to the customers, was $277,763.49; that is, $1,600 more than the entire profits on the parts.

I have not here a memorandum of the amount charged against customers that year for the repair of the returned machines, but that was about $70,000, and has been credited to this amount. That is, the total cost of repairing those machines was about $350,000, out of which we charged them about $70,000.

1024 I believe that all of our leases have a provision which, in terms, calls upon the customer to pay the expense of putting the machine in repair when it is returned on the termination of the lease. Accordingly, the company is entitled to recover from lessees the entire amount of that expense, but in fact the practice of the company is indicated by the comparative figures which I have just stated for the year 1911; that is, the expense to the company for putting such machines in repair was $350,000 and we charged up only $70,000 of it to our customers.

All of the company's lessees profit alike by this practice, which was arrived at in this way. The company establishes a figure for each machine which covers the cost of taking the machine down and setting it up again, and that figure is arrived at by doing the work in lots of 100. To that amount is added the price for broken parts and the parts which are missing when the machine comes back. Assuming that this fixed charge is $15, every manufacturer is charged that amount, plus the prices of the parts which have been taken from the machine or are actually broken when we receive the machine.

In applying this policy we don't discriminate between the customers, but treat them all alike, absolutely. Our customers

know that in this relaxation of the provisions of the leases about repairs they are all getting the same treatment, because the managers of our branch offices are all advised of the terms and conditions applying to each one of the machines, and the fact that base charges have been established is generally communicated by the agencies to all users of machines. When a machine is to be returned the agencies take up the question of cost with the manufacturer, so that the shoe manufacturer can in his own factory tell to a penny what the cost of repair would be before the machine is shipped from his factory. He knows the base charge and he knows what parts have been broken or have been taken from the machine, perhaps for use in another machine.

1025 This practice was adopted some six or eight years ago because both we and the manufacturers were unable to tell, prior to taking the machine down in our own factory, what the cost would be for putting a machine into condition to lease again; and many times a manufacturer who had returned a machine would complain of the cost of putting the machine in repair, because we had to put in new parts to replace partially worn parts, as the new lessee is entitled to have the machine in good condition. The loss to us represents the cost of putting in new parts to replace partially worn parts. The company has to put the machine in as good condition as a new one for the next lessee.

This practice has done away with all those complaints, and it was adopted for exactly that purpose, and under this method more equitable treatment to each lessee is unquestionably obtained than under the previous practice.

I have prepared a memorandum giving the names of the principal machines which are required in making different kinds of shoes, and showing the extent to which those machines are affected by any tying clauses in the restricted leases. The principal machines are in the Goodyear, lasting, heeling, and metallic departments, and I have here samples of the different kinds of shoes.

The principal machines used in manufacturing a Goodyear welt shoe, which if they are all obtained from the United Company may be under the restrictive form of lease limited to work done on the Goodyear welt sewing and outsole stitching machines, and more or less with each other, are the lasting machine, heel attaching machine, loose nailing machine and slugging machine. In the Goodyear welt shoe two seams are needed to attach the outersole, innersole, welt and upper together, and in

this respect it differs from all other shoes. In defendants' Exhibit 324, which is a Goodyear welt shoe, I have attached tags to the chainstitch seam, which unites the upper,
1026 welt and insole, and to the lockstitch seam, which fastens the welt and outsole together. The chainstitch is made by the welt sewing machine, and the lockstitch is made by the outsole lockstitch machine.

The wearing qualities of the welt shoe and its integrity are dependent upon the combined result of the welt sewing machine and the outsole stitching machine. In that respect the welt shoe differs from all other kinds of shoes, which require only one fastening machine.

Accordingly in making the welt shoe the only principal machines affected by the tying clauses in the restricted leases are the lasting machines, the heel attaching machines, and the two metallic department machines—the loose nailing machine and the slugging machine.

Defendants' Exhibit 325 is a turn shoe after it has been sewed and before it has been turned, and defendants' Exhibit 326 is a turn shoe after it has been sewed and turned. No innersole is used in this shoe, and the chainstitch around the outside of the upper is the fastening which attaches the upper to the sole. After the upper is sewed the last is pulled out and the operator turns the shoe right side out on the turning machine, a Goodyear auxiliary.

The principal machines affected by the tying clauses which are required for making the turn shoe are the heel attaching machine in the heeling department, and sometimes the slugging machine in the metallic department, although that machine is not used on the majority of turn shoes. A very few turn shoes are lasted, or even partially lasted, by machinery.

The principal machines used in manufacturing a McKay shoe, which, if all obtained from the United Company, may be under the restrictive form of lease, limited more or less to work done by each other, are lasting machine of the lasting department sole tacking machine, slugging machine and sometimes the loose nailing machine of the metallic department, and heel attaching machine of the heeling department. The loose
1027 nailing machine is not necessary. The McKay shoe is shown in defendants' Exhibit 327 and I have attached a tag to the seam. The loose nailing machine was not used in the manufacture of this shoe. The sole is attached to the innersole and upper by the McKay sewing machine, which became public long before the formation of the United Company, and which is made by a number of manufacturers.

The principal machines used in manufacturing a standard screwed shoe, which, if all obtained from the United Company, may be under the restricted form of lease, limited more or less to work done by each other, are lasting machine from the lasting department, sole tacking machine, rapid standard screw machine and slugging machine from the metallic department, and heel attaching machine from the heeling department. Defendants' Exhibit 328 is a standard screwed shoe showing the operation of these machines. In making a standard screwed shoe the machine screws a continuous wire through the outersole and innersole and after that wire has gone through it is severed by the machine, which then feeds the work along for another screw to be inserted.

Defendants' Exhibit 329 is a loose nailed shoe in which the sole is fastened to the innersole and upper by separate nails. It differs from the standard screwed shoe in that the nail is headed and its point is clinched on the inside of the shoe.

The principal machines used in manufacturing a loose nailed shoe, which if all obtained from the United Company may be under the restrictive form of lease, limited more or less to work done by each other, are lasting machine from the lasting department, sole tacking machine, loose nailing machine and slugging machine from the matallic department, and heel attaching machine from the heeling department.

A pegged shoe is illustrated in defendants' Exhibit 330. All the principal machines used in manufacturing a pegged shoe, which if all obtained from the United Company may be under the restrictive form of lease, limited more or less to work done by each other, are lasting machine from the lasting department, sole tacking machine, pegging machine and slugging machine from the metallic department, and heel attaching machine from the heeling department.

1028 The McKay, the Goodyear, and the turn shoes are made by distinct methods of construction, and there is distinct machinery for each one. In the loose nailed, standard screwed and pegged shoes the location of the fastening which attaches the outersole, innersole and upper together is the same, but there is distinct machinery for making each of those shoes.

When I testified on cross-examination that the reason for the use of the tying clauses was not to cause more of our machines to be used and to make more people use them, but that the real reason was to increase the productivity of our machines, I meant that the clauses were introduced to increase the productivity of the principal machines and by increasing that productivity

to reduce the number of machines required to do the work, and thereby reduce the cost to the company of the upkeep and service in connection with the machines, and at the same time increase the earnings of each machine.

By limiting the use of one principal machine of the company to work which has been operated upon by other principal machines of the company, its use is confined to work done by machines with which we know that prompt and efficient service is furnished to keep that machine in proper condition to operate, and with operators who have been properly instructed in the operation of the machine at the expense of our company, and also with machines where new operators will be taught whenever they are needed. Now, of course, under those conditions we have a definite assurance as to the maintenance of the productivity of the machines and the quality of work that will be produced by those principal machines with which another principal machine is used.

This tendency in the operation of the tying clauses is clearly shown by the comparison in the exhibits showing the efficiency of the machines in 1911 over the machines in the year 1900. A relatively smaller number of machines are producing a larger number of shoes, resulting in less necessary investment in machines to produce a given product and less relative expense to maintain those machines in condition to operate continuously, in the upkeep of those machines, and in the number of operators which must be instructed. The productive efficiency and quality of work done by any line of machines is only equal to that of the least efficient machine in the line.

1029 It is the fact that each of the principal machines of the United Company have been developed and improved with special reference to its operation upon work which has been or is to be done by other principal machines of the company; and also new and improved machines have been developed to cooperate with them and increase the efficiency of the previously existing principal machines.

With reference to this question of productivity, it would not be a business possibility for the company, without the requirement of initial premiums, to lease its machines on the terms of the restricted leases without the restrictions in those leases.

I was asked on cross-examination to investigate and state what the company obtained from rentals of auxiliary machines in the year 1911. On January 1, 1911, we charged to lessees of the Goodyear department auxiliary machines $83,420.22 for

rental on those machines for the full calendar year. That was not all received in cash, because during the calendar year 1911 we made allowances for the return of Goodyear department machines to the extent of $31,173, which was applied in the payment of annual rentals; that is, when a man had a machine on an initial premium lease and returned it and took a similar machine on the rental form of lease, we credited him with part of the initial premium he had paid before against the rentals. This was in order to place all of our lessees who had machines on that form of lease on exactly the same terms.

That rental was produced by about 9,000 machines, and if those machines had been put out on the same initial premium that was charged before we changed and offered these wholesale terms, the initial premiums received on them would have been $1,489,923. If the $83,000 charged for rentals had all been received in cash the amount would have been about five and a half per cent of the $1,489,923, which would have been received if initial premiums had been charged. (The initial premiums paid were for the whole life of the machine.)

With reference to my testimony on cross-examination in regard to the purchase of the Stanley plant, there was nothing about the Stanley machine shop which was peculiarly adapted

1030 for manufacturing shoe machinery. In fact, that shop was largely used in manufacturing gasoline engines and bottling machinery, and such things. The manufacture of shoe machinery does not require any particular kind of machine tools. The standard machine tools used in manufacturing all ordinary machines are the tools that are used in every factory making shoe machinery. The only other things needed are the special tools and jigs which are made by any manufacturer of a particular machine. In other words, by buying a particular machine shop, such as Stanley's, we did not acquire any particular control of existing facilities for making shoe machinery.

The McKay sewing machines which Stanley manufactured for us under the agreement annexed to Exhibit G of plaintiff's Exhibit 132 were sold or leased by us as the manufacturer desired, and we continued to sell McKay sewing machines up to the time of the bringing of this suit, and do now. At the beginning of this suit McKay sewing machines could be obtained from the following concerns, some of whom were manufacturing and supplying McKay sewing machines, and some of whom were dealers in shoe machinery.

American Worsted Machinery Company, of Abington, Massachusetts; Boylston Manufacturing Company, Boston, Massa-

chusetts; Donnolley Machine Company, Brockton, Massachusetts; J. S. Holt & Company, Boston, Massachusetts; Hamel Shoe Machinery Company, Lynn, Massachusetts; Haverhill Supply Company, Haverhill, Massachusetts; Haverhill Shoe Machinery Company, Haverhill, Massachusetts; Louis G. Freeman, Cincinnati, Ohio; Lynn Supply Company, Lynn, Massachusetts; Manufacturers' Supplies Company, St. Louis, Missouri; J. H. Nangle, Lynn, Massachusetts; R. H. Long Shoe Machinery Company, South Framingham, Massachusetts; Walter Pearson, Whitman, Massachusetts; J. H. White, Haverhill, Massachusetts; E. E. Spencer & Company, New York, New York; Rebuilt Shoe Machinery Company, Rochester, New York; Shawmut Machinery Company, Boston, Massachusetts; Atlas-Werke-Kohler & Company, Leipsic, Germany; Gimson & Company, Leicester, England; A. Johnson & Sons, Paris, France; Moenus Machine Works, Frankfurt, Germany; Timson-Bullock & Barker, Kettering, England; Standard Engineering Company, Leicester, England; Standard Rotary Machine Company, Rushton and Northampton, England; Nollesche Works, Weinsenfels, Germany; Ward & Gent, Northampton, England.

1031 Some of the companies which I have named, like the Hamel Company, Haverhill Shoe Machinery Company, and the R. H. Long Company, are larger than any shoe machinery companies doing business in the United States or anywhere else in 1898, except the three companies which came into the United Company; and they are better fitted to build machines and do build to-day a larger number of different kinds of machines than any concern in existence in 1899, including the three companies that went into the United Company. It is generally true of shoe machinery manufacturers doing business just prior to the bringing of this suit, as compared with the outside manufacturers doing business in 1899, that they are larger and are capable of furnishing a more complete equipment to factories.

The floor area of the shoe factory of the Thomas G. Plant Company in Jamaica Plain was 502,491 square feet.

With reference to certain questions asked me on cross-examination with reference to the so-called sole-leather room and the so-called fitting room, according to general usage certain names are given by shoe manufacturers to parts of their factories in which certain work is done. These are the cutting room, where the uppers and the linings are cut out; the stitching or fitting room, where the uppers, linings, and trimmings are assembled and stitched together; the making room, sometimes called the

bottoming room; and the sole-leather room. The lasting room, the finishing room, and the bottoming room referred to in some of defendants' exhibits and in some of defendants' testimony are substantially all one room. I do not know of any factories where the lasting room would be by itself. The principal machines which the United Company puts out for welting, stitching, lasting, pulling over, heeling, and metallic fastening are as a matter of practice all used in the same room of the factory, the making or bottoming room; they are grouped close together and the shoes pass through successive operations from one machine to another.

(Testimony of Mr. Winslow is suspended, at request of defendants' counsel, to accommodate the next witness.)

1032 JANUARY 13, 1914.

WILLIAM BARBOUR, witness for defendants.

I live in New Jersey and New York and I am engaged in linen thread manufacture in New York. I am president of the Linen Thread Company and a director of the United Company.

Q. A man by the name of James N. Darrah testified in behalf of the United States and said that in April, 1900, he was introduced to you by John R. dosPassos and that a conversation took place in Mr. dosPassos' private office at 20 Broad Street, in which you said as follows:

"I have a very large investment in the stock of the United Shoe Machinery Company and I don't propose to have that investment jeopardized—jeopardized by competition." And turning to Darrah you said:

"You are a competing company. You haven't got anything, anyway."

You asked him if his stock was for sale and he said he didn't think it was. You said that you thought he was making a big mistake if he didn't sell out. Then you said:

"We always try to buy out competitors, and if we can't buy them out we force them out. If you don't do what we want you to, we will crush you."

Now what do you say about that? Did you have any such conversation or make any such statements?

A. Never. I met the man, but I never made such a statement at all.

There was no threat or intimidation at all by language used by me in my conversation with him. There was no suggestion that I regarded him as a competitor who would jeopardize our interests, or that if he did not sell out we would force him out.

Cross-examination:

My recollection is that I first saw Mr. Darrah at the Lawyers' Club and Mr. dosPassos introduced me to him. I don't remember ever having been at dosPassos' office.

It was 13 or 14 years ago that I saw Mr. Darrah, since the United Company was formed. I may have seen him three or four times. He came to my office once several years afterwards. I think then he had some patent that he wanted to sell, and I suggested that he come over and see Mr. Howe.

I had some conversation with Darrah about the Standard Shoe Machinery Company, but it was more with dosPassos. I knew they were forming such a company. Darrah was present,

1033

and my memory is that it was at the Lawyers' Club, but it may have been at dosPassos' office. It is possible that I saw Darrah there. I think I saw him with dosPassos, and once or twice he came to my office.

In his first conversation with me the impression that Darrah conveyed was that he wanted to sell his company, but just what he said I don't remember. I recall that I suggested that he come over and see Mr. Howe and Mr. Winslow.

I didn't make any statement to Darrah that his concern was in competition with the United Company, and they certainly were not. I may possibly have said that I was largely interested in the United Company. I did not say anything to him about driving out competitors if they did not sell out. I never mentioned anything of the kind.

As to my purpose in telling him to come over and see Mr. Winslow or Mr. Howe, I would not have attempted to make any bargain with him if he had anything that we wanted to buy. It was natural to refer him to our president and to Mr. Howe, who was our patent attorney at that time.

I did not make Darrah any offer at all for his company. It is not a fact that I offered him $600,000 for the company. I never made him any offer at all of any kind.

Darrah came to me later on, several years afterwards, in regard to some patent, and I have those two meetings in my mind, but I may have seen him twice at that time. I don't know that I would know the man if I saw him now.

We must have discussed the Standard Shoe Machinery Company each time I had a conversation with him, because that was the reason for the call. I could not state when I saw Mr. Darrah last. It was a great many years ago.

I read Mr. Darrah's testimony after he testified in this suit, and I made a publication denying that testimony. He has sued me for $25,000 for libel.

Direct examination resumed:

I saw some report of Darrah's testimony in the newspapers i New York, and I promptly published a denial. He sued n for libel.

1034 JANUARY 13, 1914.

SIDNEY W. WINSLOW, witness for defendants, r sumed.

Direct examination resumed:

I was made aware before the Plant purchase of the extent t which there was confusion or conflict in the patent situations our company and of Thomas G. Plant. Mr. Howard notified m from time to time as interferences were declared by the Pater Office between applications of Mr. Plant and applications of the United Company, and as his investigations led him t decide that there were patent complications between Mr. Plan and the United Company.

As the result of those communications and my conferenc with Mr. Howard I discussed many of the questions with M Fish, especially regarding the patents, and conferred with M Salinger, of his firm, regarding the interferences. I also discusse these matters with Mr. Howe.

I authorized bringing the suits that were brought upon th advice and with the approval of Mr. Fish.

The confusion and conflict in the patent situation of my ow company and of Mr. Plant, the chaos which might result fro conflicting claims and constant litigation, was a substantial co sideration in my mind, affecting my negotiations or willingne to negotiate with Mr. Plant, and when Mr. Plant offered to me th patents at a price which to my mind was less than their value t the art of shoe manufacturing when combined with our machine it might be said to be a controlling factor.

Q. Now, have you looked up to ascertain how many of welte and stitchers with the Plant improvements have been out pu to the trade?

A. I have.

Mr. FOWLER. Your honors, I want to interpose the sam objection there. That is testimony after the filing of the bill.

BROWN, J. I suppose on the question of the value of th Plant acquisition.

Mr. CHOATE. And on the question of the good faith wit which we bought them and the good faith with which we a using them.

PUTNAM, J. It may be admitted for that purpose, Mr. Choat Keep it down as close as you can.

Mr. FOWLER. Your honors, of course I want to reserve an exception.

The WITNESS. On January 1st, 1914, there were in the hands of our lessees under lease 1,024 welt and turn machines, model K, embodying the Plant inventions. There were on the same date 1,158 rapid stitcher machines, model M, embodying the Plant inventions.

1035 In regard to defendants' Exhibit 221 (Rec., p. —), a list of machinery, findings, and supply dealers advertising in the trade papers in New England about the time of the organization of the United Company which were not acquired by the United Company, I was asked on cross-examination if I could state how many of those were still in business. I have looked this up and I am now able to state which of those are now engaged in business. On a copy of that list I have written "in business" or "not in business" after the name of each concern, excepting those which I testified I knew were in business. The list which I have so marked is defendants' Exhibit 221A (Rec., p. —).

On cross-examination I was requested to supply a list of the 16 Goodyear auxiliary machines referred to in defendants' Exhibit 230 (Rec., p. —) and to state the rental on each machine. This information is contained in defendants' Exhibit 230A (Rec., p. —), and I have also indicated the initial premium which was required on each auxiliary machine before the change was made from initial payments to the annual rental and the restrictive clause.

I have had prepared a list of the concerns, other than the United Company, who were in business at various times from 1899 down to the beginning of this suit and who supplied or offered to supply welt and turn machines and outsole-stitching machines. That list shows the periods during which the various concerns were engaged in business. I don't mean to say that these were in business all the time from 1899, but at some time from 1899 each of them was doing that business.

1036 Q. This memorandum purports to show the period during which those various concerns were in the market supplying, as I have said. Can you, Mr. Winslow, run off just the names of those without stopping now to give how much of the time the various concerns were engaged in the business?

A. Yes, sir.

Mr. FOWLER. I wish you would also state where they were located, if you can.

A. Puritan Machine Company, I think that is the technical name; at any rate, that is in Boston.

Q. And name the machine.

A. Puritan stitching machine for fair stitching, and Nat
stitching machine for the same work, and McKay Sewing ma
Mills turn-shoe machine, Mills Turn Sewing Machine Com
I think that company was located in Philadelphia. The mac
were manufactured for the Mills Sewing Machine Compan
Stanley at that time. Loop-lock turn machine, Loop-Lock Ma
Company, 100 Purchase Street, Boston, Massachusetts. C
pion outsole-stitching machine, Champion Shoe Machinery
pany, St. Louis, Missouri.

Q. Let me interrupt you just a moment. Sometimes a
chine is spoken of as the lock-stitch machine, sometimes as
out sole stitcher.

A. Wherever the word "lock-stitch" is used in connection
that class of machines which we are discussing it means a mac
which will make the lock-stitch used in the manufacture
welt shoe.

Q. May we regard for the purposes of this case a lock-st
machine and an outsole stitcher as machines which are inter
for doing the same work?

A. They are. May I just make one statement, that I bel
that to be absolutely true, although there may have been in
duced somewhere in the evidence some few words regardi
welt-sewing machine which did employ a lock-stitch, bu
think not.

1037 Q. Now, continue with your list, please.

A. The name of this list is "Welt and turn set of
chines, including auxiliary machines of the Duplessis Shoe
chinery Company, Haverhill, Mass." Heys turn shoe mach
manufactured by the Bresnahan Shoe Machinery Company
Lynn, Massachusetts.

Out-sole stitching machine, Union Lockstitch Machine C
pany, Boston, Massachusetts.

Welt-sewing machines and out-sole stitching machines, La
Machines Company, 100 Covert Street, Brooklyn, New Y
afterwards at 291 Broadway.

Fox turn shoe-sewing machine, Haverhill Channeling Mac
Company, 601 Kimball Building, Boston, Massachusetts.

Welt-sewing and turn sets, by the Hamel Shoe Machinery C
pany, Haverhill, Massachusetts. I understand that they offe
full lines of machines.

Welt-sewing machines and out-sole stitching machines
certain auxiliary machines, by R. H. Long Shoe Machinery C
pany, South Framingham, Massachusetts.

Welt set of machinery, Universal Shoe Machinery Company, St. Louis, Missouri.

Nollesche Works, Weisenfels, Germany; A. H. Johnson, Leicester, England, and Gimson Company, Leicester, England, welt and turn machinery, including auxiliaries.

John Callahan, Lynn, Massachusetts, advertised a welt machine.

A. H. Johnson, Leicester, England, complete welting plant.

Standard Engineering Company, Leicester, England, high-speed welt sewers with all auxiliary machines.

Standard Rotary Machine Company, of England, complete set of machines.

Nollesche Works, of Weisenfels, Germany, shoe machinery for all departments of manufacture.

Moenus Machine Works, complete outfits.

Gimson Company, Leicester, England, machines for every operation.

1038 Universal Shoe Machinery Company (Limited), for high-grade welting.

Boylston Manufacturing Company, of Boston, Massachusetts, welt set of machines.

(List showing persons or concerns in the market supplying or offering to supply welt and turn machines and out-sole stitching machines, other than the United Company, from 1899 down to the time of the filing of the bill is marked "Defendants' Exhibit 331," Rec., p. —.)

1039 I was asked on cross-examination regarding other parties manufacturing auxiliary machines but could not remember them. I have prepared a list of the persons or concerns, other than the United Company, which have been making or offering to the trade auxiliary machines for the manufacture of welt shoes. This is defendants' Exhibit 332 (Record, p. —).

As to the testimony of Mr. Jackson Johnson, Mr. Emanuel Selz, Mr. Frank Rand, and possibly other manufacturers from St. Louis, that they were not at that time aware of the fact that there was any alternative form of lease which they could take other than the lease with the restrictive clause, about six months prior to the time for their testifying I had written, or had caused to be written, letters to all those concerns advising them or notifying them of the existence of the alternative form of lease. Defendants' Exhibit 333 is a copy of that letter.

DEFENDANTS' EXHIBIT 333.

JANUARY 3, 1912.

GENTLEMEN. We are in receipt of orders from you for one or more machines of our Goodyear, pulling-over, lasting, metallic, or heeling departments.

In ordering these machines you have requested the company to lease them to you under the form of lease "where the lessee does not pay in advance a 'lease premium.' "

We assume that you are fully acquainted with the fact that machines in any of these departments may be had from this company under "initial payment" department form of leases, which leases do not contain those clauses which restrict the use of machines of one department to work that has been done on machines of one, or more, of the other departments. We shall be very glad to furnish you the machines which you have ordered under the "initial payment" form of lease if you prefer. We call this matter to your attention at the present time in order to avoid the possibility of any question of fact regarding this subject in the future.

Kindly notify us promptly of your decision, and with kindest regards, I remain,

Very truly, yours,

GENERAL MANAGER.

The WITNESS. That letter was sent in the ordinary course of business. Those concerns had quite a number of machines on order. This was the January following the conference in May, 1911, at my office, and we were again calling the facts to their attention.

1040 The average royalty paid by a shoe manufacturer for the use of all machines furnished by the United Company for the manufacture of all types and grades of shoes is less than two and two-third cents per pair.

I should like to make a statement, if I might, as to the fact that the reputation for efficiency, both in quantity and quality of work done by our machines, is always in jeopardy and affected by the introduction of a machine of some other manufacturer into the series of operations done by our machines. The reputation of our Goodyear welt shoe, the standing of that shoe, is dependent upon the two different kinds of seams that are made by the two different machines used in the manufacture of that shoe. And the quality of work done is affected, and would be necessarily affected, by the way in which the work comes from, or is prepared by, one machine to go to the next machine.

Prior to the formation of the United Company there was a constant dispute between the different companies which made up the United Company as to who was responsible for a poor piece of work. As an illustration, which could be easily understood even by one not familiar with the manufacture of shoes, the very next operation from the lasting is the welt sewing. The welt-sewing machine operator would constantly lay the blame for poor work upon the lasting operator—the operator upon the lasting machine. The lasting machine operator would constantly blame the operator upon the welt-sewing machine.

Both those reasons have to do with the use of our tying clauses for the greatest and most successful production of our machines.

As to the alleged conversation which Mr. R. H. Long testified he had had with a Mr. Hutchinson, a man in our employ, Mr. Hutchinson is not living and has not been for some time.

Cross-examination resumed:

As to whether I offer the fact that machines belonging to different companies in a measure interfere with each other in the work as a justification for putting the restrictive clauses in the leases, I offer it as a business reason for the limitation that is put upon the use of the machines when the restrictive clause is contained in the lease—as one of the reasons which emphasizes the productive efficiency of the machines working together. As to whether, if another manufacturer had just as good a machine as ours to perform one of those operations, the work
1041 would be interfered with materially—I am quite sure that it would. I think that same condition does not exist in every industry where different machines are required to do successive pieces of work. I should be very glad to give you the reason if you like. It is not true that it necessarily applies in the making of cloth or anything of that kind as much as in the case of the shoe industry. The fact is that there is no concern making these machines in the world that I know of which furnishes the service to keep the machines in proper adjustment and to attend to them as soon as they break down. Our company is unique in that particular. More than that, our machines through a series of years have been developed with particular reference to the product of our own machines. I think that there is no question that that product is of the highest type.

As to whether I advance that as a reason why our company should have the entire business, we do not claim anything of that sort. My personal belief is that the best kind of competition for the public, for the manufacturers, and for the shoe machinery dealers, is to have various concerns manufacturing

the few necessary principal machines and have the manufacturer equip his factory by either one set of machines or another. I believe that will give the best service, the best conditions for low cost of production and the best development of the art of shoe making.

It is not a fact that no other concern engaged in the manufacture of shoe machinery owns a sufficient number of machines and a sufficient number of different kinds of machines to justify keeping up a repair service. The Duplessis Company, the Hamel Company, or R. H. Long, in this country, are perfectly capable of furnishing a set of machines to make each of the different types of shoes, and, if they choose, of furnishing a service with them; and also I understand the Haverhill Company, with the exception of an outsole stitcher, but it would be very easy for them to obtain and put out a complete line.

1042 I know about the businesses of these concerns in a general way, but my opinion as to the amount of their business is based upon the evidence introduced in this suit.

As to my testimony regarding the principal machines which have been developed since 1899, there were welt-sewing machines prior to 1899 and they made a chainstitch, but the model K welter sets the stitch tighter around the toe of the shoe than any welt-sewing machine prior to its development.

It is true, as I testified, that the model K welter and the model M stitcher and the No. 5 laster perform operations that had previously been done by machinery. That is also true with reference to the loose nailing and the heel attaching machines except that the loose nailer drives two lengths of nails, which had never been done before. The pulling-over machine performs work which previously was done by hand, and as to the clicking machine, the uppers of light leathers had never been cut by machinery before to my knowledge.

As to the repair part of our business, when a machine gets out of order notice is given to us and a man is sent from the local branch office. If it is a case where a part is to be removed and a new one substituted, our man makes the substitution. That may involve taking the machine down, taking it apart, to insert the new part. The manufacturer pays the catalogue price for the new part. The old part is usually turned over to the superintendent or foreman of the factory, because the manufacturer may think that it could be used again. We have never considered that the old part belonged to us.

The new part does belong to us as a part of the leased machine. It may have to be replaced quite a number of times during the life of the machine.

As to whether our restrictive form of lease requires the payment of a return charge at the expiration of the lease when the machine is returned, that depends on the particular lease which you have in mind. My remembrance is that the Goodyear welt-sewing machine lease and outsole stitching machine lease require a payment providing the machine is returned before the expiration of the term of the lease. It is so with the auxiliary machines, as I remember it, of the Goodyear. I think some of our leases do not call, even under the limited license form, or restricted lease, for a return payment, but I can not be sure.

1043 That return charge is not collected where the manufacturer takes a new and improved machine to replace one which he has returned. In the practice of the company that return charge may be treated as applicable where a man is going out of business. For instance, we get up a new model K to take the place of the previous welt-sewing machine that is in his factory. We go to the man's factory, to our customer, and say: "Here is an improved machine, hadn't you better adopt it?" Assuming that he does, he returns the old machine to us, pays no return charge, but does pay for the broken and missing parts; that is, he is supposed to put the machine back into condition to be again leased, if that machine has not become obsolete. If it has become obsolete, all he pays for are the broken parts and the parts that may be missing in that particular machine. Missing parts result from the practice of operators of taking parts from one machine to put into another machine to replace broken parts. When we work over one of those machines that is called in to be re-leased, we sometimes put into it the new improvements when that can be done. We do not charge the old lessee for the cost of putting in those new improvements. Every lessee is supposed to be entitled to all our improvements at the same charge or on the same terms as every other lessee.

As to the different kinds of shoes which I have shown to the court, it is not quite accurate to state that those different kinds of shoes have been made for a great many years, but that the making of them by machinery is something that is modern. For instance, the McKay sewed shoe never was made by hand and could not be made by hand. The standard screw shoe was never made by hand and probably could not be. Accordingly, those two shoes are developments of machines. The pegged shoe was made by hand, and the turn shoe and welt shoe were made by hand for many years before the invention of the turn-sewing machine, the welt sewing machine and the outsole stitching machine.

The United Company never engaged in the business of manufacturing shoes. We have, of course, made shoes in small lots for experimentation and development, and we have developed new kinds of shoes.

Referring to the statement which I filed, showing the initial payments on Goodyear department auxiliary machines, we put out those machines either on an initial payment basis or on a rental. When we charge a rental we don't charge any initial payment; and when an initial payment is made there is no rental.

As to my testimony in regard to receipts from Goodyear department auxiliary machines during the year 1911, I stated that we charged lessees of Goodyear department auxiliary machines $83,420.22 for rental on those machines for that calendar year. That did not include machines put out during that year on initial payment.

As to how a portion of that amount was paid back, from the date of the adoption of the no initial payment lease for welt sewing and outsole stitching machines and the rental terms for the auxiliary machines, we allowed any manufacturer who
1044 had made initial payments on the machines, when he changed to the other leases, to a credit of a proportion, say 50 per cent, of the amounts which he had paid, so that such a manufacturer was placed on a parity with those who then took their machines on the no-initial basis. Those credits were applied in the cancellation of the payments due as rentals on the Goodyear auxiliary machines and they amounted in 1911 to $31,173. That is, we would permit a lessee who had his auxiliary machines on the initial payment basis to change to a rental basis and give him a credit based on the amount he had paid when he took them. Similarly he could change back from the other to the initial basis. That sum, $31,173, was included in the total of $83,000, so that the actual money received by us was about $52,000. If there had been no such credits we would have received the $83,000 in actual money.

We both sell and lease the McKay sewing machine. There is no royalty on that machine. On our improved McKay sewing machine, model B, the rental is $5 a month, but I think there is no rental on the old style of machine. The sale price of the model B machine is $600. The sale price of the old type of McKay sewing machine was $225 for a new machine and $125 for a rebuilt machine.

As to my testimony about being informed of the infringements of Plant's patents by our company, my understanding

in all cases where we infringed the patents owned by Mr. Plant was that we had been developing machines for some time in our experimental department at the Beverly factory; that we had machines in all stages of development; some of them, I think, we were even putting on the market at the time when Mr. Plant's patents were issued, and then we found for the first time that we infringed claims contained in the patents issued to Mr. Plant. We infringed none of his patents intentionally, if that is what you mean.

We have no knowledge whatever of applications pending in the Patent Office, except when we are brought into interference with an application before the patent is issued.

With reference to the list of concerns which have been putting out welt and turn shoe machines and outsole-stitching machines, I do not know what has become of the Mills turn-shoe machine.

1045 We haven't it. I think I have seen one of them. My remembrance is that from about 1900 to 1902 there were quite a number of them in the field. I wouldn't say that I have not heard of them since then. It has been quite a number of years since I have heard of the machine being on the market. I understand that the Mills machines were being manufactured in the Stanley Company's machine shop.

I could not tell what became of the Loop-Lock Turn Shoe Machine Company. I only know that up to a year or two ago Mr. Guptill, who testified as a witness for petitioner, made practically all his shoes on those machines. As far as I know the company is doing business now. I have heard of the machine since 1903. I don't think I ever saw one of the Champion outsole-stitching machines, and I wish to say that there are many of these machines which I have never seen. I simply know, as anyone in this business trying to collect information would know, that those companies had been doing business, but I don't go into a shoe factory once in five years. I understand that the Champion Company is doing business now, but have no idea of the extent of the business.

The Duplessis Company was succeeded by the Hamel Shoe Machinery Company, I think.

I remember knowing about the Heys turn-shoe machine at the time. We didn't acquire it with the Bresnahan Company. I know that company is not doing business, because Mr. Heys is now at work for us. I think they ceased doing business when Mr. Plant became interested with them and made their factory an experimental shop.

The Union Lockstitch Machine Company is the concern with which Mr. Merrick and Mr. Luitweiler are connected.

I know nothing about the extent of the business done by the Larsen Machine Company. My remembrance is that it tried to sell out to us and that we did not acquire it.

The Fox turn-shoe sewing machine is still on the market, and I understand it is being put out by the Haverhill Shoe Machinery Company. I also understand that the Webster
1046 turn-shoe sewing machine is being put out by the Haverhill Company. It may be that the two machines are the same.

I know about the Universal Shoe Machinery Company only in a very general way. My remembrance is that it is located in St. Louis. It may be that the Champion Shoe Machinery Company was the predecessor of the Universal Company.

I remember having heard of welting, turn-sewing, and outsole stitching machines being brought into this country from abroad, but I have no personal knowledge as to that. I can not state what company I heard had imported machines into this country and sold or leased them, but I know that they were offered in this country.

1047 JANUARY 13, 1914.

HAROLD G. DONHAM, witness for defendants, recalled.

Cross-examination:

At the request of counsel for petitioner I made an investigation to ascertain how many concerns hold machines under the lease of plaintiff's Exhibit 32 (Rec., p. —), which was the new form of metallic lease with initial payment and without restriction. This was the lease with the typewritten rider attached to it. I found that there were only eight machines put out under that particular form of lease with that particular form of rider, and those machines were all leased to F. E. Leavitt & Company, of Haverhill.

Subsequently we printed a regular initial payment form of lease without the restriction. That, however, was printed only a short time before the bill was filed, and I find that there was no instance of its use before December 12, 1911, when the bill was filed; it has been used since.

At the request of counsel for petitioner I have had prepared a list of the officers and directors of the United Shoe Machinery Company, of New Jersey, from the date of its organization up to 1908. This is plaintiff's Exhibit 274.

Beginning with 1908 the annual reports were printed and the officers and directors are shown in those annual reports which have been put in as exhibits.

Direct examination resumed:

I produce a copy of a letter sent by the company to F. E. Leavitt, of Haverhill:

The situation in that case was this: In 1910 Mr. Leavitt was manufacturing turn shoes, using the Duplessis turn shoe sewing machine. He desired to use some of our machines in connection with it, and asked us to quote him terms upon lasting machines, metallic department machines, heeling department machines, McKay sewing machines, and various general department machines. We did so by a letter dated September 2d, 1910, addressed to Mr. F. E. Leavitt, and following our quotation of the terms named he leased from us upon the initial payment lease without restriction lasting machines and metallic machines, and he purchased from us outright quite a large number of general department machines which he installed in the factory with his Duplessis turn sewing machine, and has been using since.

Defendants' Exhibit 334 is a copy of that letter dated September 2, 1910.

1048 DEFENDANTS' EXHIBIT 334.

SEPTEMBER 2, 1910.

F. E. LEAVITT, Esq., *Haverhill, Mass.*

DEAR SIR: We have been requested by you through our Mr. Smith to quote terms for the installation in your factory of the machines hereinafter mentioned upon conditions which will not preclude the use of the same by you in conjunction with certain machinery now in your possession. Complying therewith we beg to say that we will install the following machines under lease at the lease premium indicated—rents and royalties to be at usual rates:

	Lease premium.
LASTING MACHINE DEPARTMENT.	
1 Consolidated hand method McKay lasting machine	$300.00
METALLIC DEPARTMENT.	
1 staple fastening machine	100.00
1 Universal slugging machine	250.00
1 loose nailing machine	250.00
1 string nail tacking machine	75.00
1 taper nail tacking machine	75.00
HEELING DEPARTMENT.	
1 McKay automatic heel loading and attaching machine	400.00
1 McKay heel trimming and randing machine	150.00
1 spring heel trimming machine	100.00

GENERAL DEPARTMENT.

1 McKay sewing machine..... 100.00

And that we will sell to you outright the following machines at the prices indicated:

	Price.
1 Atlas leveling machine, model A	$500.00
1 heel scouring machine	65.00
1 twin edge setting machine	150.00
1 heel breast scouring machine	50.00
2 finishing shafts, 72", at $12.00 each	24.00
1 Victor rolling machine, model E	250.00
1 improved gearless sole-cutting machine, model C	225.00
1 improved veneer press (6 sections)	18.00
1 American twin sole moulding machine	450.00
1 Apex channeling machine	65.00
1 Apex feather-edge and shank-reducing machine, model A	35.00
1 Apex channel opening machine, model C	45.00
1 Apex tap skiving or rand-splitting machine, model C	50.00
1 Apex tap & sole rounding machine, Model A	35.00
1 Crescent toe-gouging machine, model C	125.00

Yours, very truly,

UNITED SHOE MACHINERY COMPANY.

By

1049 At an earlier time in your examination I asked you if you had looked at the chart purporting to show the tying clauses which is attached to the Government's bill, and at that time you were not ready to point out——

BROWN, J. I thought that had been ruled out.

Mr. GREGG. It was never offered in evidence, your honor.

BROWN, J. It is not in evidence?

Mr. GREGG. Never offered in evidence.

BROWN, J. Do you desire to put it in yourself?

Mr. CHOATE. No; I do not. I had an idea it was in.

Mr. GREGG. No; it was never offered.

BROWN, J. It was discussed slightly and then, I think, withdrawn.

Mr. FOWLER. I think, on cross-examination I asked Mr. Winslow something about it and then withdrew it.

Mr. GREGG. It was discussed here in open court and I have no recollection of ever offering it.

Mr. CHOATE. It isn't claimed that it is in?

Mr. GREGG. No.

Mr. FOWLER. Your honors, I asked Mr. Winslow something about it in a general way, and he said he understood it wasn't right, and I made the remark: "Well, I will not undertake to prove by you its correctness." That is all there is in the record.

In connection with the riders which I previously testified about I was asked how the trade in general knew that such riders were available. As an illustration as to how the trade knew about them, I stated that from the earliest times there have been furnished to lessees of Goodyear machines blank forms upon which they report the number of shoes operated upon as the basis of royalty charges. Those blanks have always had upon them columns for inserting the numbers of the special kinds of shoes to which the riders that have been used to any considerable extent relate.

For example, on these forms there is a column headed "McKay welts, stitchdowns, and sandals," another column "Hand welts, repair work," and another column "Fairstitch for ornamentation only." Below each of these headings are blanks for filling in the number of pairs of that kind of shoes on which the machines should be used. It was generally known in the trade that anybody who wished could obtain the machines for doing such work.

The operator on the machine fills in the blanks and half the sheet is torn off and sent to the company, the other half is the stub which the lessees retain. I have here forms of such blanks dated 1902, 1905, and 1910, and also a book of blanks for the current year. These constitute defendants, Exhibit 335 (a physical exhibit).

Cross-examination resumed:

Mr. Leavitt took several Consolidated hand-method lasting machines on the initial payment form of lease, and he paid $300 initial payment for each.

When that machine is taken on the restricted form of lease, there is no initial payment and the royalty is five-eighths of a cent per pair; on the unrestricted form of lease there is an initial payment of $300.00, but the royalty is only a half a cent per
1050 pair. In other words, the royalty on that particular machine is less when the machine is taken upon the initial-payment lease than when it is taken upon the restricted lease.

Mr. Leavitt also took quite a number of metallic machines. There is no direct royalty charge on metallic machines. The return received is derived from selling the fastening material which is used in the machines, and both the restricted and the unrestricted lease provide that the lessee shall purchase that material from the United Company. If the lessee takes the restricted lease there is no initial payment.

In the heeling department the royalty is the same whether the machine is taken upon the restricted or unrestricted form of lease, and the unrestricted form involves the payment of an initial premium.

Had Mr. Leavitt wished to take the automatic heel loading and attaching machine upon the restricted form, he would have been required to make no initial payment and the machines would have been restricted to use with our turn sewing machine. As he wished to use them with another turn sewing machine, in respect to which, of course, we received no return, our quotation to him was an initial payment of $400.00 for that particular heeling machine, not restricted to use with our machines. On other machines of the heeling department the quotation was $150.00 for one and $100.00 for the other.

The initial payment for the McKay sewing machine in the general department was $100.00. That machine carried no royalty.

(With reference to the exhibits attached to the petition, the following discussion took place:)

PUTNAM, J. The matter of those exhibits we ought to dispose of this morning, whether they would be considered in the case or not. I think we are practically agreed that they would not be considered in the case as proved, but we couldn't quite agree on the form of the entry to be made.

Mr. FOWLER. We all agree as to what should be done about those exhibits that are attached to the original bill; that is, so far as we are concerned, they may be omitted from the record, because such of those exhibits as have been proven, have been proven by the introduction of other leases and documents which are identical in character, but are simply a separate paper.

PUTNAM, J. Are you satisfied with that statement, Mr. Choate?

Mr. CHOATE. Yes, your honor.

PUTNAM, J. Let that go in the record, and it will cover that.

1051 Mr. FOWLER. If the case goes to the Supreme Court, I see no need of encumbering the record there with the exhibits.

BROWN, J. I understand that this statement that you have just made, Mr. Fowler, applies to the exhibits in volume 1, which purports on its cover to contain the answer and bill of particulars, and includes Exhibits 1 to 23, inclusive.

Mr. GREGG. Yes; that is right.

Mr. FOWLER. Yes; that embraces all the leases and the diagram, as I understand it.

BROWN, J. That is, from page 90 to page 225, the matter beginning on page 90 and ending on unnumbered page 224, the page which would be 224.

Mr. GREGG. Beginning on page 90; yes, sir.

BROWN, J. And ending on the unnumbered page preceding 225, which would be page 224.

Mr. GREGG. Which would be page 224; yes, sir, that is correct.
Mr. FOWLER. Page 223, and then including the diagram.

1052

JANUARY 13, 1914.

ELMER P. HOWE, witness for defendants, recalled.

Prior to the Plant purchase I gave very careful consideration to the conflict between the patents of Mr. Plant and the patents of the United Company. As fast as Mr. Plant's patents issued so that we had knowledge of what they were, in addition to such knowledge as we had derived from interference proceedings, I examined the patents and discussed the bearing of those patents with some of our men who were particularly engaged in the development of machines at the Beverly factory. I discovered that if we pursued the construction of some of our experimental machines as we had intended to, we should become liable to infringement suits by Plant. I also found that our No. 5 lasting machine, which we had been putting out in large numbers, probably infringed several of the Plant patents.

That was not done intentionally. We had no knowledge of the Plant patents until they issued from the Patent Office. All our work was done in ignorance of what he was doing. I may say that it is almost always the case that where there is a demand for a particular machine, rival inventors are at work on it. They don't either of them know of the work of the other unless they happen to get into an interference suit in the Patent Office, or one or the other of them gets a patent granted. The number of simultaneous inventions is enormous.

In the case of the Plant patents; if we had not got together, if we had not purchased him, there would have been a large amount of litigation both by the owners of the Plant patents against the United Company, and by the United Company against Plant machines. I discussed those considerations with our counsel, Mr. Fish and Mr. Phillips. I discussed them also with Mr. Winslow and Mr. Howard.

I advised the purchase of the Plant patents and inventions after I had examined the machines at his factory, and especially after he made his proposal to sell. This chaotic condition which might result from the patent situation had considerable weight in my mind. Of course, the controlling consideration for the purchase of the Plant patents was the value, the great value, it seemed to me, of his inventions, especially when combined with and merged in our machines. Then another consideration for the purchase was this avoidance of litigation, either by ourselves against him, which would have cost a great deal of money and would have annoyed the trade very much, the shoe manufac-

turers, and also the cost and annoyance of having to be sued by Plant.

Cross-examination.

I think there were fewer of our machines that infringed Plant's patents than there were of Plant machines which infringed our patents. As to whether the infringement by Plant's machines of our patents was far greater than the infringement by our machines of Plant's patents, it was greater; I cannot say whether it was far greater.

1053

We had determined that Plant's machines infringed our patents some time prior to the purchase, and had brought several suits. As to how we determined that, in some instances we were influenced by an examination of Mr. Plant's patents and we also heard rumors of the way some of his machines were constructed. As to how we got those rumors, I don't remember now and I don't think I knew at the time. I have no information about it now. The question submitted to me was: "Plant's machine is constructed so and so. Does that infringe one of our patents?" I had nothing to do with getting the evidence. I had seen diagrams of Plant's machines, but they were made by our own people.

PUTNAM, J. How much did you say, Mr. Choate, was paid?

Mr. CHOATE. $3,000,000 in cash and a million and a half in stock at par, which was worth fifty, making the total $6,000,000.

PUTNAM, J. How was it divided? How did your people divide it?

The WITNESS. They thought the stock in the T. G. Plant Company——

PUTNAM, J. What did they call that?

Mr. CHOATE. Three million and a half. And the patents two million and a half.

The WITNESS. The purchase involved an interest charge and a dividend charge on the corporation of $300,000 a year.

Mr. FOWLER. I believe the capital stock of the T. G. Plant Company was——

The WITNESS. $3,750,000.

Mr. CHOATE. And sixty per cent of the earnings of the Plant Company were sufficient to pay the entire carrying charge of the purchase.

The WITNESS. Yes, in a lean year for the Plant Shoe Company, because they had introduced Plant's machines at great expense.

1054 JANUARY 13, 1914.

WILLIAM R. SAMPSON, witness for defendants, resumed.

Direct examination resumed:

I have prepared the index list of machines offered by shoe machinery manufacturers and dealers other than the United Company, and I produce the list, which is defendants' Exhibit (Record, p. —).

Q. Now, Mr. Sampson, last Thursday, I think it was, counsel for the United States said, as we understood it, that they did not claim that the United Shoe Machinery Company had a monopoly of machines other than those for preparing and attaching the soles of shoes to the uppers, of clicking machines, and of eyeletting machines. Since that statement was made, have you prepared a list of machines offered by shoe machinery manufacturers and dealers other than the Shoe Machinery Company for preparing and attaching the bottoms to the uppers of shoes, eyeletting machines, and dieing-out or clicking machines?

A. I have.

Q. Is that the list [showing list to witness]?

A. It is.

Mr. CHOATE. We offer this, if the Court please.

(List of machines offered by shoe machinery manufacturers and dealers other than the United Company for preparing and attaching the bottoms to the uppers of shoes, eyeletting machines, and dieing-out or clicking machines is defendants' Exhibit 337, Record, p. —).

Cross-examination:

As to what per cent of the business is done by our company in the Star channeling and cementing machine I have no way of knowing, and I have no idea. To the best of my knowledge the work is largely done by hand. As to whether our company puts out more than eighty per cent of that kind of machine, I have no way of knowing.

As to whether our company puts out more than eighty per cent of the channel-laying machines, I would have no way of knowing that. That is another operation that is done a great deal by hand. I think we sell very few machines at the present time.

As to the Hadaway stitch separator and as to whether we sell about all of the machines of that kind, that is outside of my department and I have no intimate knowledge on that.

As to the sole-leveling machine, I could not state whether we put out more than eighty per cent of the machines of that kind. There are sole-leveling machines in both the Goodyear and general departments.

As to the heel seat rounding machine, we have a ~~machine~~ machines
1055 in the general department of which we sell a few. There is also a machine in the Goodyear department.

As to whether we put out nearly all the heel compressing machines and nearly all the automatic heel loading and attaching machines, those are both in the heeling department, outside my department.

I haven't knowledge as to whether we put out nearly all the slugging machines that are used in this country. That is a metallic department machine.

Mr. FOWLER. Your honors, I am just using the record of that moving picture show that your honors saw.

The WITNESS. As to whether I really know anything as to the relative amount of business that is done by these several companies that I call competing companies, my work is all on the general department machines, and I am not closely in touch with what the other departments are doing. As to whether, with reference to the general department, I have much idea of the relative amount of business done by the outside companies, I have no way of knowing what the outside companies are doing. I do the best I can myself with our machines. In answer to your question whether the only thing I do know is that I have had some correspondence with the different concerns and have examined some catalogs, and have ascertained that there are concerns which have been offering these various kinds of machines in the market—of course, the general department machines have always been in competition. Nearly every shoe machinery dealer comes into competition with some of the general department machines.

Direct examination resumed:

I know that these men whose catalogs I have produced are holding themselves out as being ready to furnish the machines that those catalogs refer to. They have agents, they are advertising, and they are here in the market presenting what they have to the trade if the trade wants it.

As to the machines in the general department, of which I have particular charge, all, with the exception of a very few, are in competition with machines furnished by other manufacturers.

Cross-examination resumed:

I do not know the extent of the business done by those competing machines. I know they do some, but I have no way of knowing how much they do.

As to how I know that these various concerns that have catalogs are holding themselves out to the trade as furnishing these various machines, I know it from the advertisements and

catalogs which they issue and from general trade knowledge. I have not undertaken to buy anything from them. I make friendly calls on them occasionally, several of them, and see the machines which they tell me they have for sale. I don't know how many they are selling.

1056 Direct examination resumed.

All these general department machines which are in competition with other machines on the market are sold outright by the United Company.

(At this point, on January 14, 1914, petitioner filed its "Request for leave to amend petition" (supra, Vol. I, p. —).

An adjournment was had until February 3, 1914. On that date defendants filed "Objections of defendants to motion of United States to amend its bill made January 14, 1914" (supra, Vol. I, p. —).

After an argument by counsel the court ruled as follows:

"As the request of the United States filed January 14, 1914, for leave to make sundry amendments to the petition with reference to sections IV, VIII, and XI, with the substitutions, is not urged as though the United States deemed the same necessary, and as it is objected to by the defendants, we do not feel justified at this late stage in allowing it, and the same is disallowed. This, however, is with the express statement on the part of the court that it reserves all questions with reference to the construction of the pleadings as urged by the defendants, whether as original or as modified by the progress of the case, if so modified.

"The request of the United States to be allowed to amend section XII is denied.

"It is ordered that the amendments offered by the United States and this ruling with reference thereto be made a part of the record of the proceedings.")

1057 Evidence for the United States in reply before the court February 3, 1914–February 6, 1914.

Appearances.

For the United States: James A. Fowler, assistant to the Attorney General; William S. Gregg, special assistant to the Attorney General; Allen Webster, special assistant to the Attorney General.

(After the decision in the District Court): Constantine J. Smyth, H. LaRue Brown, special assistants to the Attorney General.

For the defendants: Frederick P. Fish, Charles F. Choate, jr., William A. Sargeant, Malcolm Donald, Harold G. Donham, Walter B. Farr, Lafayette R. Chamberlin.

FEBRUARY 3, 1914.

EDWIN B. STIMPSON, witness for the United States.

1058 My name is Edwin B. Stimpson. I reside in Brooklyn, New York. I am a manufacturer of eyeletting, perforating and punching machines for bookbinders and have been engaged in that business for forty years. The catalogue of Edwin B. Stimpson & Son, which is defendants' Exhibit 314, is a catalogue of our company. It was printed back in 1890. During the year 1911 we put out about twenty-five eyeletting machines, which went to box manufacturers. None of them went to shoe manufacturers. In 1911 we put out not more than two or three pinking machines, which went probably to the hat trade. We have not sold any machines of any kind to shoe manufacturers for eight or nine years. The letter signed by me on May 24, 1913, defendants' Exhibit 321, was dictated by Mr. Nichols, of the United Shoe Machinery Company. He came to our office, and asked for literature on our machines, and for price lists. I gave him those and a catalogue. He then asked me to dictate a letter to his company, and as I did not know what he wanted, I asked him to dictate it himself. In dictating he added more than I could sign, so I told the stenographer to cross it out. The letter which I signed contained a statement that I built an insole flexing machine. That is not true. We don't build one. He told me that our strip cutter which was used for stripping up leather for belts and has always been sold for that purpose, was an insole flexing machine, and I therefore signed the letter stating that we could supply such a machine. At that time, and right along, I have been trying to have the United Shoe Machinery Company sell me goods and appoint me an agent in Brooklyn for some of their machinery, and I supposed

1059 that Mr. Nichols was there to size me up and see what kind of a place I had and what kind of a representative I would make. I did not ask him the purpose for which he wanted the letter, and he did not tell me. As to whether we can supply insole flexing machines, we can supply strip cutters. They are used on belts for stripping up leather. They were used years ago in the shoe trade for cutting welts and for that purpose only, so far as I know. We have no business at the present time, and have not had for several years with shoe manufacturers in shoe machinery.

Cross-examination:

The catalogue which is produced is the catalogue which I gave Mr. Nichols, and is the only one which we have. We have not used it for some years, and we have nothing more recent. He came in and asked for literature on what we had to sell. I gave him the circulars referring to the strip cutters, which was what he first asked for. He asked me for a catalogue, and I gave him that one. We make some of the machines shown in the catalogue. At one time we made all the pinking machines [indicating]. For the pinking machines we are now only agents. I did not intend to misprecsent what we were doing to Mr. Nichols. We do build the hand rivetting machine and the foot-power hand rivetting machine, and the attachments which go with them, but are agents only for the No. 2 J. L. T. rivetting machines. We supply them to the trade. We can supply either as makers or agents the machines shown in the catalogue. The letter referred to by Mr. Gregg was signed by me "Edwin B. Stimpson, president."

(Mr. Choate reads the letter as follows:

UNITED SHOE MACHINERY COMPANY,
205 Lincoln Street, Boston.

GENTLEMEN: We are sending you to-day our illustrated catalogue showing machines of our manufacture. In addition to the illustrations in the catalogue we build an insole flexing machine. Any of these machines that you do not manufacture yourselves and desire to purchase, we will be pleased to supply you.

Yours, truly,

EDWIN B. STIMPSON COMPANY,
By EDWIN B. STIMPSON, *President.*)

1060 The statement in that letter that we built an insole flexing machine is true if strip cutters are insole flexing machines. I made my statement in good faith. I meant it to be the truth and did not mean to misrepresent anything. I also made the last statement of the letter in good faith.

A Mr. Tucker, connected with the Department of Justice, came to see me, and asked me to come over here and testify that the catalogue which had been produced was our catalogue, and had been published years ago. It is our catalogue, but we are not using it. It is our only catalogue. We have published a number of catalogues since then, if you call that a catalogue. I gave Mr. Nichols what he asked for, and I did not show Mr. Nichols any of our more recent catalogues because he didn't ask

for them. He asked for strip cutters, and I gave him the literature which shows strip cutters.

Q. Have you got a cut of this thing you call a strip cutter?

A. Yes. [Produces cut.]

Q. And its function is to do what?

A. To strip leather up.

Q. By "to strip leather up" you mean to make strips of it?

A. To make strips of it.

Q. To cut strips of welt?

A. Yes.

Q. Which can be used for that purpose?

A. Which can be used for that purpose.

Direct examination resumed:

The hand and foot power riveting machines which I mentioned in cross-examination do not go to shoe manufacturers. The only machines shown in the catalogue which I have placed with shoe manufacturers within the last five years are the pinking and perforating machines, which are used for ornamental perforations.

1061 FEBRUARY 3, 1914.

EARL T. RUSSELL, witness for the United States.

My name is Earl T. Russell. I live in New York. I am a stenographer for the E. B. Stimpson Co. I took the dictation of the letter dated May 24, 1913, addressed to the United Shoe Machinery Company and signed by Edwin B. Stimpson, from Mr. Nichols of the United Shoe Machinery Company. Mr. Nichols dictated the letter, and as he went along Mr. Stimpson told me to cross out part of it, and then Mr. Nichols went along and dictated more of the letter. The only conversation which I heard regarding the insole flexing machine was that Mr. Stimpson said, "We do not make it," and Mr. Nichols said, "That is all right—put it in."

(No cross-examination.)

1062 FEBRUARY 3, 1914.

EDWARD E. SPENCER, Jr., witness for the United States.

My name is Edward E. Spencer, jr. I live in New York. My business is shoe manufacturers' supplies, machinery, and general machinist. I was formerly connected with Edward E. Spencer & Company and was in charge of their general mechanical department. Edward E. Spencer is my father. That company went into bankruptcy in August, 1912, and is not now engaged in business. The catalogue of Edward E. Spencer and Company which has been produced (defendants' Exhibit 312) was printed in 1897.

Edward E. Spencer & Company built channeling, rolling, splitting, impression stitch, buffing, and eyeletting machines, finishing shafts, strip cutters, punchers, and special dies and various small tools.

The company for five years prior to 1911 did a business in shoe machinery and accessories of twenty-five to thirty thousand dollars a year. The amount of business done in shoe machinery with the shoe trade in 1911 was very small.

Shoe machinery was not the principal business of the company, which dealt chiefly in general findings, entering into the accessories of which the shoe is constructed, exclusive of leather. They sold nails, tacks, wax, thread, ink, and linings.

I know of the machine business of John O'Flaherty of Rouses Point, New York, and have handled their lockstitch machine for harness work. It could be used in the heavier upper work on shoes, but not in the bottoming of the shoe.

John D. Randall & Company of Cincinnati put out machines for harness trade. The only machines put out by them which could be used in the shoe trade were strip cutters.

Spencer & Company were agents for the Ross-Moyer Manufacturing Company of Cincinnati. That company put out edge

1063

setting, buffing, randing, heel scouring and heel breasting machines, brush shafts, and cement pots. Our agency was discontinued when the United Company acquired the Ross-Moyer Company.

Cross-examination:

Edward E. Spencer & Company were in business up to August, 1912. There is a later catalogue than that which is Exhibit 312. The other catalogue—the later one—did not deal with machinery particularly. There were a few items of machinery, but it was devoted more especially to supplies. So far as machinery was concerned, Exhibit 312 was in use up to the time the company went out of business. Spencer and Company could not furnish some of the machines later than a year or two after the issue of the catalogue. We both manufactured machines and dealt with them as agents. At the time when the companies for which they were agents were taken over by the United Company, the Edward E. Spencer Company ceased to be agents for them. The Ross-Moyer Company was one example. There were others.

A strip cutter can be used for making welting, and formerly was used extensively for that purpose. It is not much used at present for making welting. By an adjustment of the knives it could be converted into a machine for flexing, and it has been

so used. It is sometimes known as an insole flexer. My father is living. He was the principal proprietor and manager of the Edward E. Spencer Company. I was in charge of their general mechanical department for about twenty or twenty-five years before 1912. The catalogue which is Exhibit 312 was never withdrawn.

Direct examination resumed:

A few copies of the catalog of Exhibit 312 were sent out during the time of the old concern. I may have sent out a few copies recently, but very few to shoe manufacturers, principally outside the shoe line.

1064 Cross-examination resumed:

Some copies of the catalogue were sent out during the last year in which Edward E. Spencer and Company was in business. I do not describe myself as successor of that company.

1065 FEBRUARY 3, 1914.

JOHN F. MORRIS, witness for the United States.

My name is John F. Morris. I am New England manager of the Singer Sewing Machine Company, and am located in Boston. The Singer Sewing Machine Company does not manufacture or put out any machines used for preparing, attaching, or finishing the bottoms of shoes. It does not manufacture eyeletting or clicking machines. We do not handle those classes of machinery as agents for any other concern.

Cross-examination:

I do not know whether my company or anybody connected with it has anything to do with the Hamel Shoe Machinery Company. Mr. John Sullivan has been connected with my company, and may be now connected with it. I have never known his title or what his office was. If he is a director or general sales manager, it is not to my knowledge. He may have an interest in different machines that are coming through—buttonhole machines—something of that kind. He is reported to be President of the Hamel Shoe Machinery Company. If the Singer Sewing Machine Company is backing the Hamel Shoe Machinery Company or supplying it with money, I do not know of the fact.

I wouldn't know it if it were.

1066 FEBRUARY 3, 1914.

EDWARD J. EICHLER, witness for the United States.

My full name is Edward J. Eichler. I reside in Needham, Massachusetts. I am a salesman for the American Tool and Machine Company. We manufacture a belt knife splitting machine, transmission machinery, sugar machinery, lathes, and

extractors for the woolen mills. The company does not manufacture any machines which are used for preparing or attaching the bottoms to the uppers of shoes, nor does it make any eyeletting or clicking machines.

(No cross-examination.)

1067 FEBRUARY 3, 1914.

WILLIAM L. BARBER, witness for the United States.

My name is William L. Barber. I am not now in business—since 1911. I formerly was associated with my father. We dealt in general light machinery and special machines of our own make and invention for making the uppers of shoes, and conducted our business under the name of L. L. Barber and Company. The Company is not now engaged in business. We did not make any machines used for preparing or attaching the bottoms to the uppers of shoes. We did not make any eyeletting or clicking machines.

Cross-examination:

The machines which we made which could be used in the manufacture of shoes were presses, dies for perforating toe caps, and perforating machines for perforating uppers, and some smaller attachments which were used upon Singer sewing machines for stitching uppers.

Our place of business was 40 Lincoln Street. Our market in the shoe industry was largely in New England, to some extent outside. My father had been engaged in business continuously since 1859. He retired in 1911

1068 FEBRUARY 3, 1914.

CHARLES H. LAWRENCE, a witness for the United States.

My name is Charles H. Lawrence. I live in Cambridge. My business is manufacturing and dealing in shoe machinery and shoe patterns. The name of my concern is Coburn & Lawrence Company, and is located in Boston, 154 Lincoln St. We manufacture or put out the Champion seam-rubbing machine, a size marking machine, a blacking machine, and, as agents, the Rogers vamp-marking machine.

We do not manufacture or put out any machines used for preparing and attaching the bottoms to the uppers of shoes, nor any eyeletting or clicking machines.

(No cross-examination.)

1069 FEBRUARY 3, 1914.

LESLIE L. HARTWELL, a witness for the United States.

My name is Leslie L. Hartwell. I live in Revere and am superintendent for A. G. Walton & Company, who are shoe man-

ufacturers. I have put out a few machines which can be used in manufacturing shoes. They were a grooving machine, a sanding machine, a heel-building machine, and a counter-dividing machine. The last machine was put out about two years ago. None of the machines which I have developed is used in connection with the preparing or attaching the bottoms to the uppers of shoes. I made some of the heel-building machines for our own concern and then sold the rights to manufacture them to the Young Machinery Company. That is the power heel-building machine which Young has on the market now.

Cross-examination:

My heel-building machine builds heels. My grooving machine grooves soles ~~preparatory~~ to putting them on the upper. The sanding machine sands the grain from off the tap of a Goodyear shoe so that it will stick to the upper. The tap is a part of the sole. The counter-dividing machine permits counters to be made double, and afterwards divided. The counter is the part of the shoe which reinforces the heel seat. In fact each of my machines had something to do with the bottom before it was attached to the upper.

Direct-examination resumed:

I built one heel-building machine for our concern, and sold to the Young Heel Building Machine Company the right to reproduce the machine in other factories. The machine
1070 is used by heel manufacturers, and by shoe manufacturers who make their heels. It is the universal heel-building machine to-day.

Cross-examination resumed:

A great many shoe manufacturers make their own heels. Each of the machines which I have mentioned is used in the Walton factory.

1071 FEBRUARY 3, 1914.

ARTHUR F. BROWN, witness for the United States.

My name is Arthur F. Brown. I live in Newton. I am a manufacturer's agent, and represent the Davis Sewing Machine Company, of Dayton, Ohio. The machines which they put out are sewing machines for family and manufacturing use, but as far as I know are not used in the manufacture of shoes. We have sold none to shoe manufacturers. I do not see how our manufacturing sewing machines could be used for attaching the bottoms to the uppers of shoes. I am not an expert in shoemaking.

Cross-examination:

We have a catalogue of our machinery. As to whether our sewing machine was ever used for sewing the uppers to shoes, or any parts of them, I haven't seen it used in any stitching rooms that I have visited. I have not urged its use for that purpose. Our type "A" manufacturing sewing machine is adapted for harness and saddlery work, and therefore to work on leather. The machine which we have been trying to sell to the United Company is a machine which we have recently produced, a taping machine, which fastens an adhesive tape to any material, which is particularly adapted to fasten adhesive tape to that part of the upper where the buttons or hooks are attached, in order to reinforce the leather. It was exhibited first to the shoe trade in July, 1912. We are endeavoring to introduce it to shoe manufacturers. It is going pretty far to say that we have been offering to sell it to the United Company. We brought it to their attention. We have no organization for selling to shoe manufacturers.

1072 FEBRUARY 3, 1914.

BENJAMIN F. CHAMBERLAIN, witness for the United States.

My name is Benjamin F. Chamberlain. I am manager of the Walpole Shoe Supply Company, which manufactures and sells shoe supplies and incidental machinery for their use. We make a rib tightener which does the finishing operation on the Gem inner sole. It has been in the market for about two years. We also put out heating machines for heating coated Gem cloth and the adhesive material on it. We have put out possibly fifty rib-tightening machines to shoe manufacturers within the last two years.

Cross-examination:

My place of business is in Boston, 60 South St. We coat canvas (defendants' Exhibit 31), which is used by the United Shoe Machinery Company for its Gem inner sole. We supply a great deal of it, and we also make one machine for performing an operation on the Gem inner sole.

Direct examination resumed:

That machine is the one of which I have testified that we have sold approximately fifty. I have seen in factories machines put out by the United Company which do the same work.

1073 FEBRUARY 3, 1914.

JOSHUA S. WHEELER, witness for the United States.

My name is Joshua S. Wheeler. I live in Winthrop. I am principal owner of the business of J. S. Wheeler & Company,

who make welt cutting machines, cloth cutting machines, and lace cutting machines. We also rebuild shoe machinery. Our factory force consists of from two to six men. We put out a rebuilt machine which we call the Baby splitting machine. The new machines which we put out are the welt cutting, cloth cutting, and lace cutting machines, and a counter divider. All our machines are sold outright. They are not leased. Some of our machines go to shoe manufacturers. Most of our welt cutting machines go to welt manufacturers, although we have sold a few to shoe manufacturers. I buy and rebuild shoe machinery and sell it to shoe manufacturers. That is part of our business. I rebuild almost anything I can buy and get an order for. I have never rebuilt any welt sewing or outsole stitching or heeling machines. I deal with the small machines—vamp machines and sole cutters. It takes in a regular line of machinery outside of the sole stitchers. I have rebuilt National stitchers and Puritan stitchers, and things of that kind. The last stitching machine which I put out was over a year ago. I do not know to whom it went.

Cross-examination:

I do not handle an insole flexing machine, unless they call a welt cutter a flexer. I handle the Baby splitting machine, but I have not built any new machine. The welt cutting machine could be changed over so that it would be a flexing machine and not a welt cutter. I have not been in business long enough to put out any catalogue or advertisements.

1074 Mr. CHOATE. I want to call attention to the fact that all we offered was that this man put out a splitting machine and an insole flexing machine.

Direct examination resumed:

I have been engaged in business since two years ago last July.

1075 FEBRUARY 3, 1914.

FRANK P. SPAULDING, witness for the United States.

My name is Frank P. Spaulding. I live in West Somerville. I am manager of Willcox and Gibbs' Sewing Machine Company's Boston office. That concern puts out sewing machines. It does not put out, so far as I know, any machines used for preparing or attaching the bottoms to the uppers of shoes, nor any eyeletting or clicking machines.

Cross-examination:

We put out a good many machines for stitching the uppers of shoes, and we also put out what we call a Number 5 stitch adjustable tension machine, to which the United Shoe machinery

Company adds an attachment which enables it to perform some operation in connection with the insole. It stitches some channels together, some leather that is raised up on the inner sole. As we put it out it would be used for sewing cloth. You can sew leather with it. It will sew an ordinary chain stitch inseam in leather as we put it out if the leather is not too thick. We put out some sewing machines for operating on uppers—not a very large number. My company, the Singer, and the Union Special Company put out most of the machines used for sewing together the uppers of shoes. We sell or lease our machines all over the United States and our headquarters are in New York. The sewing machines which we put out to shoe manufacturers are all used for sewing uppers, as far as I know. We have been making them for over fifty years.

1076 FEBRUARY 3, 1914.

JOHN H. LINGLEY, witness for the United States.

My name is John H. Lingley. I live in Brockton and am manager of the business of the Puritan Manufacturing Company. It manufactures sewing machines used for fair stitching, counter work, vamping, barring, and strapping.

I can not say how many machines we put out in 1911, or how many to shoe manufacturers. The majority of our machines go to shoe manufacturers. Our fair-stitch machine sews the upper onto the welt. Other than that we do not make any sewing machines which are used for attaching the bottoms of shoes. We sell some of our machines to the United Shoe Machinery Company. I don't know what percentage.

Q. The fair-stitch machine—is that used for attaching the sole to the upper, or is it an ornamental stitch?

A. It is more ornamental, and in the stitch-down shoe they attach the sole to the upper.

Cross-examination:

We sell our machines to anyone that wants them. Among our other customers the United Company is one. We put a good many machines on the market besides our fair-stitching machine. We sell a good many Puritan fair-stitch machines, and have probably sold around a thousand since we first went into business in 1892 or 1894. Practically all of them have been sold to shoe manufacturers, and they are used all over the United States. We sell a few staying machines, which operate on the back seam of a shoe, and a boot counter-stitching machine, which operates on the counter. I can not say whether we sell a button-fly seaming machine, or button-fly staying machine. We do sell a counter-stitching machine and a foxing stitching machine, but do not sell a lining-stitching machine. We also

sell a foxing staying machine, and pocket-strap stitching, quarter-seaming, side staying, vamp-seaming, welt-seaming, and vamp-welt sewing machines. I think we sell a side-staying machine, but am not sure. Our welt-seaming machine attaches a McKay welt to the sole before it is laid. Our Puritan fair-stitching machine and our vamp-welt-seaming machine are used in the operation of attaching the sole to the upper. All the machines mentioned are sold to shoe manufacturers. The Puritan fair-stitch machine is also used largely in making the stitch-down shoe. We have just commenced that. It stitches the upper to the sole of the stitch-down. The stitch-down is the one where the upper is turned outward on the sole and stitched directly through.

1077

Direct examination resumed:

Q. All those machines that have been named, are they separate machines or one machine with a different attachment for a different operation?

A. They are built different. The frame is practically the same; we make one, two, three, and four needle machines.

Q. What do you mean by that?

A. For instance, we make a three-row machine, which stitches three rows at one time. The fair-stitch machine stitches only one row.

Q. (By Mr. CHOATE.) You say the standard is the same; you mean the upright column?

A. Yes; they are about the same, the frame.

Q. But the machine itself is different in each case?

A. Oh, yes; the working parts of the machine are different. We have been making a machine used on the stitch-down shoe only within the last two years.

1078

FEBRUARY 3, 1914.

CHARLES S. PRESCOTT, witness for the United States.

My name is Charles S. Prescott. I am treasurer of the Lockett Crimping Machine Company, which is located in Brockton. They are manufacturers of crimping machines, which are used for crimping the vamps of shoes. The vamp is part of the upper. We do not make machines which are used in connection with attaching the bottoms to the uppers of shoes. We sell some of our machines to the United Shoe Machinery Company. Most of them we sell ourselves to shoe manufacturers. We have been in business about fifteen years. In 1911 we put out perhaps fifty machines.

Cross-examination:

The Lockett crimping machine forms the vamp so it fits on the last. The vamp is the part from the tip to the point where

the tongue is sewed on, the part which fits down on the last. It gets the upper ready for the operation of lasting—for all the operations that are performed while the upper stays on the last. It has no particular reference to the use of the stitching machine. The crimping operation adjusts the upper to the shape of the last and holds it on the last firmly. We control the marketing of these machines, and we market them ourselves. We have been marketing them all over the United States for fifteen years. Among our customers is the United Company.

Direct examination resumed:

The crimping operation precedes the pulling-over operation. The United Company has no machine for performing the crimping operation, so far as I know.

1079 Cross-examination resumed:

The crimping machine is also used where shoes are pulled over by hand and on shoes which are lasted by hand.

1080 FEBRUARY 3, 1914.

L. E. JOHNSON, witness for the United States.

My name is L. E. Johnson. I am connected with the Victor Shoe Machinery Company, which manufactures rough rounding and channeling machines and an outsole stitching machine. The last named is used for attaching the outsole to the welt after the welt is attached to the upper. We have put out about thirty-two lock-stitch machines to small shoe manufacturers who are not using the standard line of shoe machinery. By the "standard line of shoe machinery" I mean the United line. We sell our machines outright. So far as I know, the persons who have bought them were not using United Company machines. The other machine which we put out is a rough rounding and channeling machine. We have put three of them out. They have gone to repair men, to the rapid shoe repair trade, and not to shoe manufacturers. We have put out certain finishing machines used for finishing shoes, which include burnishing and edge-setting and everything of that kind, in the repair trade; nothing to manufacturers.

I know something about the business of the Universal Shoe Machinery Company and the Champion Shoe Machinery Company of St. Louis. They supply the rapid shoe repairing trade and I have handled their machines. I am not interested in the companies. They put out a lock-stitch machine, a welt machine, that is, an inseamer, a finishing machine, and a nailing machine. We have placed some machinery with the repair trade for the Champion Shoe Machinery Company.

Cross-examination:

A lock-stitch machine is a machine which sews the outer sole to the welt, as distinguished from the stitching machine
1081 which sews the inner sole. We make such a machine.

We were organized three years ago, but only began to put out our machines last September. We didn't get through the experimental stage and ready to make deliveries until then. Since then we have delivered thirty-two of our lock-stitch machines. We have been putting out a rough rounder and channeler longer than that. It is a machine intended to perform an operation on the sole of a shoe, for completing the work of attaching the sole to the upper. Our finishing shaft sands the bottoms and edges and heels of shoes that have been repaired or made over, and finishes and sets and trims the edges after it is complete. It performs that operation in finishing up the bottoming operation. It could be used upon a new shoe. It is adaptable for either purpose. Our indenting machine indents the stitches, but it could hardly be used on a new shoe, because the wheel can not get into the shank.

Q. Your skiving machine—what is that for?

A. That is for skiving the base of any kind of sole leather before the taps are put on for half-soling.

Q. It could be used for skiving any kind of soles?

A. It could be; yes; I judge so.

Q. Whether old or new?

A. Yes, sir.

Our tacking machine is a foot-power loose nailer, adapted only to repair work. It is used for nailing outer soles on to the insoles.

Q. Except for the fact that that is a foot-power machine, is there any reason why it should not used on new shoes?

A. The only reason would be the lack of speed.

An attempt has been made to adapt it to power, but it was not successful. I have known the gentleman at the head of the Universal Shoe Machinery Company for the last eleven years. They have been in business all that time as the Champion Shoe Machinery Company, not as the Universal. For about a year and a half they have been putting out the welt and turn sewing machine. It is adapted to making either welt or turn shoes. The loose nailing machine nails on soles. They have had that on the market for eighteen months at least. Their lock-stitch and straight needle machine has been on the market for ten or eleven years.

It is used for sewing on half soles, but it would not sew on
1082 full soles, because the straight needle is not applicable for getting into the shank. It could not do fair stitching, it

would not be classed as a fair-stitch machine because it used heavier thread and was a lock stitch. It is an out sole stitcher. Their finishing shaft is substantially the same thing that we are selling. It is for finishing soles on either old or new shoes. They have been getting them out for some years. Every one of their machines and every one of our machines is used in connection with the operation of attaching the bottom of the shoe to the upper.

Direct examination resumed:

The business of the Champion Shoe Machinery Company is almost exclusively with the repair trade. The Universal Shoe Machinery Company is intended to do business with the shoe factory trade, but I do not know anything about the amount of business they do.

I am a stockholder in the Specialty Shoe Machinery Company of St. Joseph, Missouri, which makes foot-power loose nailing machines. They have been engaged in business eight years. The business is exclusively with the repair trade.

Cross-examination resumed:

That company formerly, for about 5 years, made a finishing shaft intended to finish soles after they had been attached to the upper, but discontinued three or four years ago. Now they make a machine for nailing on soles. Both the loose-nailing machine and the finishing shaft are used in operations connected with the attaching of the bottom of the shoe to the upper.

Direct examination resumed:

They are used exclusively in the repair trade.

1083 Cross-examination resumed:

The loose nailing machine is not adapted to use on new shoes, because the last would have to be taken out of the upper, and because it is a foot-power machine. The finishing machine is a power machine, and would be adapted for new shoes, if the man could get along with a small space.

1084 FEBRUARY 4, 1914.

STEPHEN SNOW, witness for the United States.

My name is Stephen Snow. I was formerly employed in the shoe factories of George E. Keith and W. L. Douglas. I worked for Mr. Douglas for two years. He was then making men's welt and McKay shoes. His daily capacity was then about ten thousand pairs a day. He used the Consolidated hand-method lasting machine and the Ideal lasting machine. He had more Ideal machines than Consolidated. He used the Ideal machines on both the McKay and welt shoes. I can not state what percentage of the welt shoes were lasted on the Ideal machines. I

had charge of the Ideal lasting machines. I did not have anything to do with the Consolidated. Mr. Douglas used more than a dozen Ideal lasting machines. I won't go any farther than a dozen. I do not remember that he had any Chase lasting machines.

I worked for Mr. George E. Keith for the year immediately preceding my going with Mr. Douglas. He was making men's McKay and welt shoes, and his capacity was about ten thousand pairs a day. I do not remember that he had any kind of lasting machines except the Ideal machines of which I had charge. He had about a dozen of them. I do not remember that he had any Chase machines. The Ideal machine could not be used successfully in lasting men's heavy shoes, because in wiping over the toe, the shoe lifted from the toe piece. That was not on account of the strength of the machine—it was on account of what it lacked. Mr. Douglas and Mr. Keith made about a four-dollar shoe which was as heavy as they generally make in those factories.

1085 Cross-examination:

I left Mr. Douglas in April, 1904, and since that time, I have been a watchman in the Statehouse. I was at Douglas factory from the spring of 1902 to the spring of 1904, and at the Keith factory from the spring of 1901 to the spring of 1902. My particular work was with the Ideal machines. My attention was upon them, and I did not know what else they had. I was a mechanic. I was an operator, too. I was not a shoemaker.

Q. Did you make an invention which was attached to the Ideal machine when it was installed in the Keith factory?

A. I did.

Q. What was it?

A. What I called a hold-down.

Q. And its purpose was what?

A. To hold the shoe—keeping it from raising when you lasted heavy work.

Q. Why was it necessary to hold it down?

A. Because when we wiped up over the toe of the shoe the toe would lift off the toe-rest.

Q. Was that the difficulty with the Ideal machine?

A. Yes, sir.

Q. Wasn't it a fact that before you invented that hold-down and improved it the Ideal machine could not commercially successfully last men's shoes?

A. No, sir; it could not. As I understand your question, you mean all kinds of men's shoes?

Q. Yes. The operation of pressing over the leather lifted the last right up?

A. Yes, sir.

Q. That was the defect with the Ideal when it worked on anything except very light leather?

A. Yes.

Q. You invented something that held the last down in place?

A. Yes.

Q. Did you ever take out a patent on it?

A. No, sir; I wanted to.

Q. Where were you working when you invented that?

A. In Mr. Keith's. I put them on all of Mr. Keith's machines, and then put them on Douglas' when I went there.

Q. Did you also invent something else that held or that brought the wipers in around the counter?

A. Yes, sir.

Q. Did you get a patent on that?

A. Yes, sir.

Q. When did you get that out?

A. I don't think I got the patent out until 1905—something about then.

Q. When did you invent the improvement and attach it to any machines, either in Keith's or Douglas'?

A. I should say it was—I shall have to guess at it—I should say about 1901 or 1902.

Q. What was the necessity of this device which brought the wipers in around the counter?

A. I can explain it better by showing you. They used a very heavy counter at that time (the witness illustrating by reference to the heel of his own shoe), and the heel band would not bring the corners of the counters in.

Q. The heel band of the Ideal machine?

A. Yes; would not bring the end of the counters in. I made a something that would bring them in. I don't know what they called it after it was patented.

1086 Q. Have you got your patent with you?

A. Yes, sir; I think so. I had it this morning.

Q. I show you what purports to be United States patent No. 946,708, and call your attention to the drawing attached to it headed "Snow Lasting machine—application filed September 5, 1905"; is that a drawing showing the device which you invented for pressing in the counters?

A. Yes, sir.

Q. To attach to the Ideal machine?

A. Yes.

Q. And it consisted of these two arms which operated to press the counter in. When was that device attached to the Keith and Douglas machines?

A. I don't know; if I remember right, I think I put one on Mr. George E. Keith's, on one of his machines, to try it, before I left there.

Q. It was while you were there that you thought the thing out?

A. Yes.

Q. Now, did anybody else get out a patent on an improvement of your hold-down device?

A. Yes, sir.

Q. I show you what purports to be United States patent No. 947,818, and call your attention to the drawing attached to it, which is entitled "E. F. Heffernan, hold-down attachment for lasting machine." Does that drawing show the hold-down device that you got up?

A. Yes, sir; the same thing, only of course there was more to it; but it is the same principle.

Q. It was your principle?

A. Yes, sir.

Q. And it was the device that you attached to the machine?

A. It was.

Q. You say, Mr. Snow, that there was more to it than the drawing shows; you mean more to it in the drawing than there was in the device?

A. Yes, sir. This (indicating on drawing) presses down a little different way from mine; mine went with a lever. That is all the difference there is—the same thing exactly.

1087 Q. The same principle?

A. Yes, sir.

Q. Occasioned by the necessity of finding something that would hold the last down for the operation of the Ideal laster?

A. Yes, sir.

Q. Now, it was with these two devices and improvements attached that Mr. Douglas used the Ideal laster on men's shoes?

A. Successfully; yes.

Q. And without those the Ideal would not last men's shoes successfully, would it?

A. No, sir.

The United Shoe Machinery Company's Number Five laster embodies these two improvements, which we were using from 1902 to 1905.

(The illustration of the device for pressing the counter is marked "Defendants' Exhibit 338." The illustration of the

hold-down device originally got up by the witness and perfected by Heffernan is marked "Defendants' Exhibit 339.")

The patent on the attachment which presses in the counter was assigned by me to the United Shoe Machinery Company and is embodied in their Number Five lasting machines.

Direct examination resumed:

I do not remember that Mr. Keith added any Ideal machines to his factory while I was there. He was using the Ideal machines on men's welt shoes when I first went there. I added my hold-down attachment at different times during my stay. I put on the first one a very short time after I went there.

1088 Q. During that whole time before that attachment was put upon the Keith machines he was lasting men's welt shoes on them, was he, or not?

A. I suppose so. I wasn't there.

Q. And how long had he been lasting men's welt shoes on those Ideal machines before you went there?

A. I couldn't tell you anything about that.

Q. Had you, or not, been around his factory?

A. Not for some time.

I put the heel attachment of which I spoke on one of his machines, but I do not remember whether I put it on any others. He used all of his Ideal machines in lasting men's shoes during the entire year which I spent there, although, as far as I remember, only one had attached to it my device for pressing in the counters.

Q. Now, when you speak about not lasting men's shoes successfully, state what you mean.

A. I mean that if you have got to go over a shoe two or three times, when it isn't necessary to go over it but once, that it is not a successful machine—not a successful operation.

Q. That is, it doesn't do it as rapidly as the machine with the attachment?

A. No, sir; and my experience has been that manufacturers don't look at anything as very successful unless it is pretty swift.

Q. So that that is what you mean by successfully done?

A. Yes, sir.

Q. By going over it two or three times, it was done all right?

A. No; it wasn't done all right then. The more you wipe up a toe the worse it is. * * * You take it on patent leather, you couldn't wipe it only about once or twice. If you do, you take the enamel off.

Q. So the work of the laster was improved by these attachments?

A. Yes, sir.

At the time when I went to Mr. Douglas' factory he had been making shoes for many years. When I went there none of those attachments were on his lasters. I put them on as quickly as I could get them on. I don't suppose it was 6 months before I put them on. During the time I was there and before I put them on the Ideal machines were being used constantly in lasting men's welt shoes.

Cross-examination resumed:

So far as I know, Mr. Douglas and Mr. Keith were the only people in the country who used the Ideal machines with this hold-down in connection with lasting men's shoe. I think it was these two improvements that changed the machine from an unsuccessful machine into a successful one.

1089 Direct examination resumed:

When I said the Ideal laster could not last men's heavy shoes, I meant long-legged boots, brogans, miners' shoes, and shoes of that character. Nothing could handle those shoes except the McKay-Copeland machines.

1090 FEBRUARY 4, 1914.

HAMPARS HARPOOTLIAN, witness for the United States.

My full name is Hampars Harpootlian. I live in East Weymouth. I work in the shoe factory of George E. Keith. From 1900 to 1910 I worked in the factory of the T. G. Plant Company. I was a side laster. I was there at the time they had the trouble about wages. I know Frank Morrison, Abram Sochat, and Charles Ross, who sometimes goes under the name of Charlie Gordon. I don't know him as Ross; I know him as Charlie Gordon. Morrison was working at the Plant factory in 1910. He left shortly after we had the matter up about the increase in wages.

(At this point the United States offered to prove by the testimony of Hampars Harpootlian, Peter Gostanian, and Asardu Astoorian that Frank Morrison, Abraham Sochat, and Charlie Ross paid to the above-named persons certain money during the year 1910 for the purpose of unionizing the employees of the T. G. Plant factory. The evidence was offered for the purpose of rebutting the testimony of the defendant that Morrison, Sochat, and Ross did not pay out money to employees in the Plant factory. The evidence was excluded on the ground that it was cumulative and a part of the United States' direct case and is not properly offered in rebuttal.)

(No cross-examination.)

1091 FEBRUARY 4, 1914.

FRANK MORRISON, witness for the United States, recalled.

I know Cross Johnson. He was working with me at the Plant factory in 1910. I talked with him about forming a union among the employees, and he attended meetings held for that purpose. I told him by whom I was employed to unionize the Plant factory, and what we wanted to do. He signed his name. We paid him fifteen dollars, upon his promise to help us out by getting names for us. He did not get any names, but even denied what he had signed. I never went near him—never told him to help me out. I didn't want anybody to help me out; so he said he was afraid of his job.

(No cross-examination.)

1092 FEBRUARY 4, 1914.

PETER GOSTANIAN, witness for the United States.

I live in East Weymouth. I am a shoemaker. I was working in the T. G. Plant factory in 1910. I was a puller over. I know Cross Johnson very well. I saw Cross Johnson at a meeting held for the purpose of trying to unionize the lasting room of the Plant factory.

(No cross-examination.)

1093 FEBRUARY 4, 1914.

ASARDU ASTOORIAN, witness for the United States.

My name is Asardu Astoorian. In 1910 I was employed in Plant's shoe factory. I was a toe laster. I know Cross Johnson. He was working in the factory at that time. I attended a meeting at 988 Parker Street, at which Cross Johnson was present. The meeting was held for the purpose of forming a union of Plant's employees.

(No cross-examination.)

1094 FEBRUARY 4, 1914.

OSCAR HEATH, witness for the United States.

My name is Oscar Heath. I live in Brockton. I am connected with the Boston Last Company, which manufactures lasts. We make an electric embossing machine used for embossing names on shoes, a backing press, which is used for putting backing cloth on leather, and a treeing machine, used for treeing shoes, and a post ironing machine. We do not make any machines used in connection with attaching the bottoms to the uppers of shoes, nor any eyeletting or clicking machines.

Cross-examination:

Mr. CHOATE. I want to call the court's attention to the fact that we did not claim that he made any bottoming machinery.

We claim that he made a backing machine, an embossing machine, a post ironing, and two treeing machines.

Q. You do make all those, don't you?

A. Yes, sir.

That is my catalogue which you produce. The single-handled iron which we describe as having been developed "for crowners and lasters in the bottoming rooms of shoe factories" is a tool which is used for taking the wrinkles out of the toes of shoes after they are lasted. That is not really bottoming work. We should call it a tool to perfect the work of the lasters. The machine described in our catalogue as "post" or "bench heater" is used for taking wrinkles out of turn shoes, and that class of work. That is an ironing operation.

1095 FEBRUARY 4, 1914.

ELMER W. WALKER, witness for the United States.

My name is Elmer W. Walker. I live in Brockton. I am connected with the Brockton Stay Company. We manufacture boot and shoe findings. We make some machinery for own use, and what we don't want we sell. We make a pasting machine which is used for pasting the tape onto the vamp in shoe factories. It is not used in connection with the bottoms at all.

Cross-examination:

Mr. CHOATE. The only thing that we claimed the Brockton Stay Company made was a pasting machine—Wheeler tape-pasting machine.

We make that machine—the Wheeler tape-pasting machine, occasionally; not very often, but whenever it is wanted.

1096 FEBRUARY 4, 1914.

GEORGE KNIGHT, witness for the United States.

My name is George Knight. I live in Brockton. I am a machinist connected with George Knight & Company, which manufactures machinery. We do not manufacture a heel-building machine, but fifteen or twenty years ago we did make a little foot machine for building up pieced heels. I can not say how many we have put out. We have not made any within the last fifteen years, and we do make a vamp-creasing machine which is used for creasing the vamp after the shoe is made. We used to make a McKay channeling machine, but have not handled any of them within the past fifteen years to any extent. Up to about eight years ago we made and put out a power gang eyeletting machine. We have not put out any within the last eight years. Twenty or twenty-five years ago we made a channel-laying machine. We formerly made a channel opening

machine, but I think we have not made any within the past eight or ten years. I now make the punch-tip machines named in defendants' Exhibit 321, in several models; models E, F, and G, and a punch, power tip; punch, hand tip, punch, foot power. They are principally used for perforating toe caps. I also make a feather-edge and shank-reducing machine, which is used for reducing the shank of the sole. I sell them to shoe manufacturers. I also make a lip-turning machine, which is used for turning the lip of the inner sole. We sell some of our machines to the United Shoe Machinery Company, any that they have call for—sell them through them; and the tip-punching machines that we market in foreign countries we sell through them.

Cross-examination:

1097 We sell to anyone who wants to buy, and the United Company among others. The Peerless Company now makes eyeletting machines which we used to make. We run a general machine shop.

Q. You are ready to make any kind of shoe machine that anybody asks you to make?

A. Any machinery that I find sale for.

Q. And are able to?

A. Yes.

Herbert J. Sinclair is a gentleman connected with the United Company. I know him. I wrote the letter which has been produced (letter No. 9 in defendants' Exhibit 321, addressed to the United Company, and marked "Mr. Herbert J. Sinclair"), offering to furnish tip-perforating presses (models E, F, & G), hand, foot, and power tip-punching machines, vamp creasers, feather edgers, lip turners, and K and K cementing machines. We do make all of these. We have made heel shaving, lining sticking, and heel building machines in the years I have been in business. I have been in business there 29 years, about. There was more sale for some of those machines years ago than there has been recently; we know how to make them, and are ready to make them if anyone asks us to.

The Peerless Company is making and supplying the eyeletting machines, which we formerly made, in quite large quantities. They are used by shoe manufacturers.

Direct examination resumed:

I dictated the letter which Mr. Choate showed me. We have made within a dozen cementing machines in the last five years. We employ from twelve to eighteen men, including clerks, and all the help.

1098 FEBRUARY 4, 1914.

FRED S. SPRAGUE, witness for the United States.

My name is Fred S. Sprague. I live in Brockton. My business is machine building. I am connected with Kimball Brothers & Sprague. We make a welt laying machine which is used only for laying the Arnold flex welt, which was invented by Mr. William B. Arnold. We sell it to shoe manufacturers. The United Company has no machine for performing a similar operation, so far as I know. We employ about eighteen men, but none of them are just now engaged in making this welting machine. We have put out not more than twenty-five or thirty in the past five years. Our principal business is making last turning machinery.

Cross-examination:

The letter dated May 17, 1913, to the United Company offering to sell them the Arnold flex welt layer, which is part of Exhibit 321, and is signed Kimball Brothers & Sprague, was written by me. The letter and the circular which follows on the next page of the exhibit are all right. We make the Arnold flex welt layer, of which I have spoken.

1099 FEBRUARY 4, 1914.

THOMAS BOSTOCK, witness for the United States.

My name is Thomas Bostock. I live in Brockton. I am a machinist. I manufacture a machine which builds the heel before it is attached. We have sold quite a number to the United Shoe Machinery Company and to other companies—anybody that wants them. The United Company makes a heel building machine, but it is not like ours. We make a rand-cutting machine, which trims off the end of the rand which is left projecting from the heel seat, in connection with the heeling operation; a tap-cutting machine, which can be used for most anything, a heel lift gouging machine, which gouges out the heel before it is put on the shoe, so that it fits the heel seat, and which also can be used by changing the knives for slashing McKay welts, making it a McKay welt slashing machine; a toe softening machine, which is used upon the upper, and a rand turning machine which turns up the rand, giving shape to the heel. We do not make a spring heel scarfing machine. We have handled them. We have bought them secondhand once in a while and resold them.

We have been engaged in business about seventeen years. In the past we have put out as many as one hundred heel building machines a year. We have not put out so many lately. The heel building machine business is not the principal part of our business. We build all kinds of machines. Any machine that

anyone wants, we build—embossing machines and sandpaper machines—any machines anyone wants. We build all kinds of machines to order. We do not build a welt sewing machine, an outsole stitching machine, a heeling machine, or a lasting machine. We employ about fifteen men.

1100 Cross-examination:

We have a general machine shop and facilities for building from patterns and drawings any kind of a machine anybody wants. We have a number of machines that we make right along. Our letter of May 12th, 1913, which I signed, and the two sheets which comprise our catalogue, relate to the machines which we are making right along. They are the toe softener, which we sell at four dollars and a half; heel lift gougers, at fifty-five dollars; cap cutters, fifty dollars; spring heel scarfers, sixty dollars; and turners, without bearing, twenty dollars, with bearing, twenty-two dollars; heel builders, straight mold and military mold, 10 % off; heel builder, six or more, 15 % off; rand choppers, with straight or gouge knife, fifty dollars; welt slasher, male and female, sixty dollars; rand cutter, thirty dollars; box toe press, two hundred and twenty-five dollars.

We have built these machines for outside parties and are ready to build them for anybody who orders them. The toe softener prepares the toe for lasting. The heel lift gouger gouges the heel after it is built, preparing it for attachment to the bottom of the shoe. Our tap cutter cuts taps which are part of the sole, the spring-heel scarfer scarfs spring heels—you do that on that same machine—and the rand turner operates on the rand, which is part of the heel seat.

Each of our machines performs an operation which is either preparing or finishing the bottom of the shoe before or after it is attached to the upper, or getting the upper ready for attachment to the sole.

Direct examination resumed:

The box toe molding machine is used for molding box
1101 toes. We have put out about twenty altogether.

Our heel building machines go both to shoe manufacturers and to heel manufacturers. I think the shoe manufacturers get the most of them. We have built a good many for the shoe manufacturers. We have built 30 for the Douglas Company.

1102 FEBRUARY 4, 1914.

CARL A. CARLSON, witness for the United States.

My name is Carl A. Carlson. I live in Brockton. I am connected with Carlson Brothers, who are sheet metal workers.

We make a toe softening machine used for softening the box of the shoe before it is lasted. We sell them outright to the manufacturers of shoes.

Cross-examination:

The purpose of the machine is to prepare the toe of the shoe for the operation of lasting. They are used altogether by shoe manufacturers, and are sold for six or eight dollars apiece. We have been in business a long time, and have supplied them in considerable quantities to anyone who wants them.

1103 FEBRUARY 4, 1914.

GEORGE D. HAZEN, witness for the United States.

My name is George D. Hazen. I live in Brockton. I am connected with the Hazen-Brown Company, cement manufacturers. We have cementing machines made for us, used for the purpose of applying a certain kind of a cement to the bottom of the sole in order to stick a tap. We sell the machine to the Cochituate Oilproof Company, which loans them to shoe manufacturers for the purpose of putting on their cement.

Cross-examination:

The Cochituate Company makes a cement, and the machine is devised for the operation of applying that cement. They rent that machine to shoe manufacturers, and make their profit out of what they get for cement. The machines are made for us, and we are supplying them to the Cochituate Company. A patent was applied for but I do not know whether it was allowed. I am a stockholder in the Cochituate Oilproof Company for which the machines are made.

1104 FEBRUARY 4, 1914.

FLOYD H. OGDEN, witness for the United States.

My name is Floyd H. Ogden. I am the New England manager of the Standard Sewing Machine Company, of Cleveland, Ohio. The machines made by our company which are mentioned in defendants' Exhibit 321 are not used in connection with the preparing or attaching of the bottoms to the uppers of shoes—not that I know of. They are all used in connection with the upper, so far as I know.

Cross-examination:

Formerly we made all of the machines shown on the list, but we do not now. I wrote the letter bearing my signature which has been introduced, and sent the attached circulars. I have been manager since the first of last March. I haven't had anything to do with the manufacturing end of the business in Ohio. The only machines which we now make are those

shown on the circulars. We have a stitching machine which has five different attachments for different operations—bellows tongue, button fly lining, button stay, eyelet row, eyelet stay and fancy. Each is a different kind of operation and there has to be a different fitting for each one. We have a seaming foxing machine. The list of machines in defendants' Exhibit 321 comprises descriptions of operations which the several machines can do by various attachments and modifications. I am not very familiar with the machines themselves. I have never worked in a shoe factory. I was not with this company before I came to Boston.

1105 FEBRUARY 4, 1914.

ALBERT G. BREWER, witness for the United States.

My name is Albert G. Brewer. I live in Natick. I am a machinist and inventor. I make a McKay welt-slashing machine, which I sell to shoe manufacturers. I have not put out more than ten altogether, of which the last was sold a year and a half, or two years ago. I employ one man. I also make other machines.

Cross-examination:

The letter dated May 23, 1913, bearing my signature, is my letter. That letter shows an illustration of the double rapid welt slitter, and says: "Which we can sell you for $100. Prompt delivery can be made on receipt of order." I attached the printed circular which was introduced in evidence. The machine mentioned, the double rapid welt slitter, is the machine about which Mr. Gregg just asked me. We have not made any for a year and a half.

1106 FEBRUARY 4, 1914.

JOHN M. TOWER, witness for the United States.

My name is John M. Tower. I am connected with Tower Brothers, of Hudson, Mass., machinists. We make a buffing machine which is used for sandpapering the bottoms of shoes. We have been at it a great many years. We put out perhaps ten of them last year. They go to shoe manufacturers. We also make and put out perhaps ten or a dozen sole-cutting machines in a year. We make a heel-scouring machine. We used to make and put out a good many heel-scouring machines, but we have not done a great deal with that for the last few years. We put out perhaps two or three last year. We formerly made a stamping machine for stamping the name on the bottom of the shoe, but we do not now. We make stripping machines for anybody who wants them, but they have gone out of fashion. We make a rotary edge-setting machine. I formerly made a good many, but, as they make better work, they

don't use them. We make a heel-trimming machine and an edge-trimming machine, but have not put out a great many. They have most all gone to cobblers.

We employ from twelve to eighteen men, and do a machine, millwright, and piping business, principally machines.

Cross-examination:

We have a country machine shop in which we do most anything that comes along. The letter dated May 17, 1913, bearing my signature and describing the machines which we make was written by me. The machines which we make are comprised in the list read by Mr. Gregg. The high-speed buffer, bevel-
1107 ing machine, edge trimmer, edge scourer, stamping machine, heel trimmer, rotary edge setter and power stripping machine all have to do with finishing the sole or the heel after it is attached to the upper, or getting it ready to attach to the upper. The vamp cutter and the dieing-out machines are for dieing out the sole.

1108 FEBRUARY 4, 1914.

JOHN BULMER, witness for the United States.

My name is John Bulmer. I live in Boston. I am superintendent of the J. S. Holt Co. (Inc.). That company is engaged in the business of secondhand shoe machinery. We have built no machinery since I came with them, on January 1, 1912. I couldn't say what machines the company built before January 1, 1912. We do not now build a stamping machine or a welt-indenting machine. We have handled a few secondhand machines of these types since January 1, 1912; not over two or three welt-indenting machines. We do not make a McKay sewing machine—that is, since January 1, 1912—but have handled not over a dozen of them at second hand since then. We get them generally from shoe manufacturers; secondhand shops.

Cross-examination:

When I went with Holt I was working in Boston in a machine shop. The letter which was produced, dated May 2, 1913, and signed J. S. Holt & Company (Inc.), was written by Mr. J. S. Holt, who is now dead. I recognize the signature. I do not know anything about the letter.

McKay sewing machines are to be had from about all the shoe manufacturers. They pass through our hands more or less frequently, and we rebuild or repair them and furnish them to others. We have no difficulty in getting them at any time.

Direct examination resumed:

I do not know whether there is any difficulty in selling them or not. I am not the salesman; I don't know anything about the selling.

1109 FEBRUARY 4, 1914.

VALENTINE H. McDOWELL, witness for the United States.

My name is Valentine H. McDowell. I live in Saugus, Massachusetts. I worked for two months for the McDowell Shoe Machinery Company. That company was in existence from March 26, 1912, to March 26, 1913, at which time it went out of business complete. The McDowell Shoe Machinery Company did not put out or handle a heel-beading machine while I was with it, or a heel-trimming machine. I was with it only two months, in the early part of its existence.

Cross-examination:

My father is living, and is in the shoe-machinery business. He has been in the shoe-machinery business for a great many years, longer than I can remember. His name is Alexander. His business was conducted under his own name until the corporation was formed, then for a year that same business was run as the McDowell Company, and after the corporation was wound up by some court proceedings he carried it on again in his own name. I am as familiar as anyone except my father with the business and the machines which he put out. I cannot say one way or the other as to whether he or the McDowell Company put out a heel-beading or a heel-trimming machine.

1110 FEBRUARY 4, 1914.

ALONZO H. HATCH, witness for the United States.

My name is Alonzo H. Hatch. I live in Malden. I am New England manager for the Union Special Machine Company. The overedge machine and the butting machine which are mentioned in the list under our company's name which appears in Dfts. Exhbt. 321, are used for preparing an imitation Gem insole. They are not used for fastening the bottoms of shoes. A foxing machine is used for staying the seam on a fox shoe. That is a certain style of fittings of the upper. Except in the cases I have mentioned, the machines made by our company are used in connection with the uppers only, with the further exception that we have fitted up one machine especially for making a corded welt. We did that for the Walpole Supply Company and W. B. Arnold.

I know that there is a Metropolitan Sewing Machine Company. I think its business is confined chiefly to the fabric trade, although there are some of their machines, I understand, being used in the shoe factories; in fact, I have seen one only in a shoe factory. That is used for closing the heel lining.

Cross-examination:

The imitation Gem insole to which I referred is patented by a man named Ham. I am not familiar enough with it to know whether it is used in connection with a welt shoe or not. The different machines named in the list which our company makes perform operations in fastening together the different parts of the upper and the lining. They assemble it in preparation for the lasting operation. They are practically all machines for performing operations for preparing the upper for the lasting operation.

1111 Direct examination resumed:

Our machines have nothing to do with adjusting the upper over the last.

1112 FEBRUARY 4, 1914.

FRANK P. EMERSON, witness for the United States.

My name is Frank P. Emerson. I am treasurer of the Shawmut Machinery Company, of Boston. Our company manufactures a hand cementing machine, which is used on the vamp; the cementing machine, hand lining, is the same machine; and a power hammer for hammering down the folds of the uppers, any folded work on the uppers. We also make a tip-scouring machine, which is used on patent leather tips, and a rubbing machine, a power machine for seams—a seam rubber. The company began a year ago last July to manufacture McKay sewing machines, and put the first one out last June. Three of them are now out on trial with shoe manufacturers.

The tip-scouring and pasting machines are sold to shoe manufacturers, and are used in connection with the uppers. We make no machine except the McKay sewing machine, which is used in connection with bottoming, and until a year ago we did not make any McKay machines.

Cross-examination:

The McKay machine which we are making is an improved machine of recent design. We call it the most up-to-date McKay machine on the market. Formerly Walter Pearson was making it for us. But our Mr. Buck framed the ideas. We never handled the old type of machine or dealt in second-hand machines. The old type was the basis for our machine.

The tip-scouring machine fixes up cracks or scratches in patent leather which come in some part of the operation of connecting the bottom with the upper, I suppose, and reenamels it if it is necessary.

1113 FEBRUARY 4, 1914.

GEORGE H. DIEHL, Jr., a witness for the United States.

My name is George H. Diehl, jr. I live in New York City. I have been connected with the Fortuna Machine Company since

its organization in 1903. We do not build a heel-building machine. We do manufacture skiving machines for skiving the uppers, vamps, and all parts of shoes. It is not and can not be used in connection with the bottoms of shoes.

Cross-examination:

I am president of the Fortuna Company, and have been since 1903. The picture shown in Dfts. Exht. 321, on page 63, is a picture of one of our skiving machines. We began making that model about three years ago. We have been making our model C skiving machine, a regular model, since 1903. Referring to the advertisement appearing in the "American Shoemaking" of July 6, 1912, reading "We will exhibit a full line of our machinery at the Sixth National Shoe and Leather Market Fair to be held at Boston, July 10–17. We shall also show a new heel-building machine," that is signed "Fortuna Machine Company," which is my company. We exhibited that heel-building machine, which was owned by a man named Geiger, and which we proposed to handle if it was a success. It has not been successful, and we have done nothing with it.

1114 FEBRUARY 4, 1914.

WENDELL P. BOSWORTH, witness for the United States.

My name is Wendell P. Bosworth. I live in Brockton. I am connected with the Brockton Heel Company, manufacturers of heels and toplifts. We do not make a heel-building machine, but we make a sanding machine, and we have been making for the last two months a heel-log measuring device, which we lease to shoe manufacturers and heel manufacturers, more to the former. The United Shoe Machinery Company builds no machine for performing a similar operation, to my knowledge. We manufacture no other machines except the two named, but we have other machines made for us.

Cross-examination:

We supply shoe manufacturers with a heel-log building machine, which is made for us. It has a long tube, in which lifts are forced and compressed by a plunger, making a long log of leather. The log is sliced off into blanks by an automatic machine. The blanks so sliced off are used in building heels, which are sold to shoe manufacturers. It is one way of building heels. The letter which you produce bearing my name, dated May 29, 1913, giving prices on the Bosworth heel-log building and slicing machine was signed by me. The log builder and the log slicer are illustrated in defendants' Exhibit 321 (No. 43). The sanding machine is used for evening the butt in the end of

the log after it has been severed by the automatic slicer—that is, preparing the heel before it is put on the shoe.

1115 Direct examination resumed:

There is a great deal of difference between a heel-log building machine and a heel-building machine. The heel-building machine nails the heels individually in a form.

1116 FEBRUARY 4, 1914.

J. HAMMOND STEWART, witness for the United States.

My name is J. Hammond Stewart. I live in Lynn. I am connected with Stewart Brothers, who have been manufacturing counter machinery for approximately twenty years. We manufacture finishing machines, counter end; a molding machine; a skiving machine; a waxing and rolling machine, and a wetting machine. The United Shoe Machinery Company makes machines to perform only one of the operations for which the machines which I have named are designed, that is, the counter-skiving machine. The finishing machine which I have named is used for finishing the end of a counter, the waxing and rolling machine for putting the counter into shape before the molding operation, and the molding machine for molding the counter. The wetting machine is used for getting the counters in temper. The United Shoe Machinery Company's counter-skiving machine is different from ours. Ours skives by two knives; the United skives with one knife and a form.

I am the owner of our concern. I have never offered to sell my business to the United Company, nor has anyone at the present time connected with my concern had authority to enter into such negotiations.

Cross-examination:

I purchased the business two years ago in February. Previous to that time perhaps it was offered to the United Company by my brother. The machinery which we manufacture is used for making and adjusting molded counters to the last. The operations of the counter wetting and molding machines are necessary to prepare a molded counter for the lasting operation.

1117 FEBRUARY 4, 1914.

LEOPOLD C. TAPPEY, witness for the United States.

My name is Leopold C. Tappey. I am a salesman. At one time I handled machinery for the Keighley Company, of Vineland, New Jersey. I was with them during the year 1911, placing their inseam trimmer with shoe manufacturers in New England. At that time they made a cleaning machine, a finish-

ing machine, and an inseam trimmer. I did not have anything to do with the finishing and polishing machines. The cleaning machines are used for cleaning the uppers and edges of the soles. I put out about twenty of the trimming machines during 1911, on trial, with the understamding that if they were satisfactory the manufacturer bought them. I have had no connection with the company since 1911.

(The United States here introduced in evidence in connection with the Keighley Company, whose catalog was introduced by the defendants as part of their Exhibit No. 321, an agreement entered into September 21, 1912, between the United Company and the Keighley Company with respect to the marketing of the Keighley Company's inseam trimming machine for the purpose of showing that the Keighley Company, as to the machine covered by the agreement, was not in competition with the United Company. The agreement was admitted for that purpose and was marked "Exhibit No. 275" by the clerk.)

1118 BROWN, J. Of course it must be limited in its use to that purpose.

Mr. GREGG. I am only offering it for that purpose, your honor, to show their control.

Three of the rotary cleaning machines manufactured by the Keighley Company were put out by that company during 1911.

(No cross-examination.)

1119 FEBRUARY 4, 1914.

EBEN W. THOMAS, witness for the United States.

My name is Eben W. Thomas. I am treasurer of the C. S. Pierce Company, a corporation engaged in the manufacture of shoe specialties. We make certain machines for our own use. (4650) The C. S. Pierce Skiving Machine Company markets a skiving machine which is made for it. It is used for skiving upper leather, but it is not used in connection with the bottoms.

Cross-examination:

The Pierce skiving machine which we market is shown on the page cut from the "Superintendent and Foreman" of April 24, 1912, which is a part of defendants' Exhibit 321.

1120 FEBRUARY 4, 1914.

THOMAS WORSENCROFT, witness for the United States.

My name is Thomas Worsencroft. I am a welter, and am now in the employ of Howard & Foster, of Brockton. In the latter part of 1890 I was working for the Rapid Lasting Company, and was employed by Mr. George W. Copeland. I worked for him about a year and a half. My duties were to instruct men to operate the Rapid laster. That was the machine which

was succeeded by the Ideal lasting machine. I never was agent for the Ideal laster. I never installed the Ideal in any factory. The only difference between the Rapid machine and the Ideal was that the Rapid machine worked by foot power, and the Ideal by steam power. I worked with an Ideal machine for three or four years in the factory of the Duquesne Shoe Company, of Pittsburgh, Pennsylvania. They were making men's Goodyear welts. I was with them from 1897 to 1901, and they used no lasting machines except the Ideal. Before that I worked in the factory of Whitman & Keith, of Campello, Mass. They had been using the Copeland Rapid machine, and while I was there they installed one Ideal machine when it first came out. The first machine made was put in there for experimentation. There was not much difference between the machines. If a man could run one, he could run the other. It was in that factory that I learned what the difference was. Whitman & Keith were making a $3.50 to $5.00 men's welt shoe. I worked there a little over a year, and went from there to Pittsburgh. I did not know anything about the Chase machine at that time, but afterwards saw its operation in factories.

I am familiar with the work of the Ideal machine on men's welt shoes. I have not worked on the Chase machine. The Ideal did better work on men's welt shoes than the Chase machine. As to rapidity, you could do as much on one machine as on the other, according to the operator. The Chase
1121 machines were in George Snow's factory at the time I was working there, in 1893. I worked for six months for S. A. Crooks Company, of Hopkinton. They used the Rapid laster on men's McKay shoes. In 1891 and 1892 I worked at the factory of John Hanan & Sons, of New York City. They were making high-priced shoes, all welts and hand sewed. They used several Rapid lasters on their welt work. I was at George Snow's factory in Brockton in 1893. He made men's welt shoes. He used both the Rapid and Chase lasters. I worked there nearly a year. I do not remember when the two attachments that the witness Snow described were incorporated in the construction of the Ideal laster. I don't remember anything about it.

Cross-examination:

I am now welting shoes at Howard & Foster's, in Brockton. I have been running a welter off and on since 1894. That has been my principal work. As to whether I have been doing any lasting since I began to run a welter, I have instructed others in my capacity when I was in Pittsburgh. I ran lasters—the

Ideal machine. I was a foreman in the factory at Pittsburgh from February, 1897, to February, 1901. They had one Ideal laster and no other kinds when I went there in 1897, and did all of their lasting upon it. They were not then turning out more than fifty pairs a day. They made men's fine welt shoes. Their product was a light shoe of the better grade, and was not a heavy or work shoe. They gradually increased their number of lasting machines until about two years after I went there they had five in all. Then they were making an even better and more expensive shoe. They are now out of business. That is the only factory where I have had actual experience with the Ideal laster since 1894. I never ran a Chase lasting machine, and I never saw both Chase and Ideal used in the same factory, but I have
1122 sewed shoes that have been lasted on Chase machines.

When I went with Howard & Foster they had Chase machines, but they did not and do not now have Ideal machines. In my direct testimony I compared the work which I had seen done on the Ideal with work which I saw done in 1912 on the Chase. For eight years—until the last year and a half—I have sewed shoes after they had been lasted on the Chase machines. I was comparing what I saw a few years ago at Howard & Foster's with what I saw ten or twelve years ago at Whitman & Keith's. The Ideal machine did better work than the Chase, because it left the toe smoother. It was made with a wiper, and not with a pad. It did not push the inner sole back onto the last.

On later Ideal machines which I saw, there was a device for holding down the last. Those were the ones which I saw the last time I was at Whitman & Keith's. I can not say how many years it is since I have seen an Ideal machine. It is quite a while. The last time I worked on one, other than as an instructor, was when I was in Pittsburgh between 1897 and 1901. I never worked on a Chase machine or instructed workmen upon it.

Q. All you saw was the result of work that you thought came from a Chase machine?

A. Yes; worked after it.

1123 FEBRUARY 4, 1914.

WILLIAM P. WHITMAN, witness for the United States.

My name is William P. Whitman. I am a shoe manufacturer. My factory is at Campello. My product consists entirely of men's medium and fine welt shoes. I have been in business since 1883. The capacity of my factory is about twelve hundred pairs. We obtained one of the first Ideal machines put out, and machines of that kind have been in our factory ever

since. We are still operating six or seven of them and are using them in lasting men's welt shoes. We have also been using the Number Five lasting machines for 3 or 4 years. I think we obtained our Ideal machines, all but two, before the formation of the United Shoe Machinery Company. We leased them at first and then bought them from the Goodyear Company.

I am president and treasurer of the company. I spend most of my time at the factory. I see very little difference between the quality or the speed of the work done by the Ideal and the Number Five lasting machine.

I used the Eppler welt machines. We operated one of them for several years. We obtained it before the formation of the United Company. We never had more than one. We continued to operate it until after the United Company bought them out. I consider the Goodyear welt system the best system; it did better work on the shoe. We used the Eppler machine for three or four years along with the Goodyear and then exchanged it for a Goodyear machine.

Cross-examination:

Mr. Snow, who has been a witness, was in our factory and did work for the Lasting Machine Company. I do not think he attached any hold-down to our lasting machine. The hold-down which we have is known as the Heffernan. I 1124 think we have had it since the spring of 1909. I think that was the first time we had any hold-down on our machines at all. I do not think we had any device for pressing the counter into the shank devised by Mr. Snow. I am not really a machinery man, and attachments might be put on the machines by the superintendent without my knowing it. With the hold-down device the Ideal machine is very similar to the Number Five.

Q. Now, those improvements were rather essential to making the Ideal machinery satisfactory, weren't they?

A. Since the high toe came in; yes, sir.

Q. Now, the high toe came in some twelve or fourteen years ago, didn't it?

A. Not the extreme high toe, I don't think.

Q. No; not the extreme high toe which you are making now and have made within a year or two, but the higher-toed lasts were coming in ten or twelve years ago?

A. Yes, sir; I should say so.

Q. Mr. Howard showed me one which is marked "1899 to 1901." Does your recollection agree with that, that toes were of that shape as far back as that?

A. I should think that was rather high for that time, in my opinion.

Q. Well, they were beginning?

A. Yes, sir.

Q. And have become more and more exaggerated ever since?

A. Yes, sir.

Q. And it is a problem with the old-fashioned Ideal laster to last those high-toed shoes without the last slipping up?

A. Yes, sir.

Q. Unless you have this hold-down?

A. Yes, sir.

Q. And without the hold-down you can't last those high-toed shoes as a good shoemaker wants to have it?

A. Not satisfactorily; no, sir.

The shoe which we make is a medium fine grade, gentlemans, walking shoe, and is not a heavy work shoe. It is of medium weight leather.

Our output was larger in 1899 than it is now. We were making some McKay shoes. We were then making from nine hundred to a thousand pairs of welt shoes and a total production of fifteen hundred pairs. Twelve hundred is our largest capacity. The Ideal machines which I now have are the same machines which I obtained by lease, and what I had in my mind as an arrangement by which I got them was some provision in the lease with reference to the relations between me and the owner of the machines. I don't know what that was. I have always supposed that we owned the machines. I understand there is a contention there. I have never looked the lease up. For many years I paid a royalty. As to whether there has been any transaction between us and the lessor of the machine since the lease was executed by us, whatever the transaction was my father made it. I am not familiar with it. My information on this point as to whether I hold it under lease or otherwise is not very definite, except that I always understood that we owned the machines.

1125 FEBRUARY 4, 1914.

EDWARD F. HEFFERNAN, witness for the United States.

My name is Edward F. Heffernan. I am employed by Whitman & Keith. The Whitman is the Mr. Whitman who has just testified. I have been employed by Whitman & Keith for seventeen or eighteen years. At first I operated a lasting machine and for about six years I have had charge of the lasting department. I operated an Ideal lasting machine for twelve or fourteen years, but have never operated any other kind of lasting

machine. When I first went with Whitman & Keith they were running the Copeland Rapid, as well as the Ideal lasting machine. The difference in the work between the two is not great. The carriage slides back on the Ideal, where the other drops down. The Ideal is steam power and the Copeland is foot power. I began to run an Ideal laster for Whitman & Keith around 1898 or 1899. At that time there was no attachment on the machine to hold down the toe, nor was there anything to press in the leather around the counter except what we called a heel pad.

I am the Edward F. Heffernan who is the patentee of U. S. Patent No. 947,818, dated February 1, 1910, for what is called an appliance for holding the toe down. I never saw the appliance which has been described by Mr. Snow. Our machines had no such appliance until that which I invented was attached to them. That was first used in 1909 or 1910. I had myself lasted shoes for twelve years without any appliance of that kind. Seven Ideal machines and four or five Copeland machines were used in the factory at that time.

We have had an attachment which we called a heel pad on our machines for over twelve years. It is a little piece of brass used for squeezing in the counter. We have the attachments designated by the figures 34, 33, 32 and 30 in Patent No. 946,708 issued January 18, 1910, to S. Snow.

1126 We installed three Number Five machines three years ago, and are using them and seven Ideal machines. The same operator can get as much, if not a little more, from the Ideal machine as from the Number Five. The quality of the work depends upon the operator. I claim the Ideal is a little faster. I can run both machines myself, and I claim the Ideal is a faster machine. Anything that is lasted on a Number Five can be lasted on an Ideal machine. The Number Five is heavier and stronger, but I think the Ideal by a stronger construction could be made to last any kind of shoes.

Cross-examination:

I was observing particularly what was going on in our own factory with reference to the use of Ideal machines, and paid no attention to the difficulties other people might be having with them, or what improvements or attachments they added to them, even though it was in the same town.

Q. Now, why did you put on this hold-down?

A. Because of the bowing of the tips and flattening of the heels.

Q. What does "bowing of the tips" mean?

A. Pulling up the tip of the shoe, pulling that cap line out of true, because there is nothing to hold the shoe down on the toe rest.

Q. What happens to the heel?

A. It flattens the back of the heel—flattens it in, because the heel pad had to take all the pressure of lasting the toe.

Q. Why were you bowing the tips?

A. Because it was up off the toe rest.

Q. Was that a new condition which had just developed?

A. Mostly since the high toes came in.

Q. Are both those things imperfect workmanship?

A. Yes; considered so.

Q. When you say "we," you mean even good operators using the Ideal machine were doing that?

A. Yes.

Q. Then it is a condition of the operation of the Ideal machine upon high-toed shoes?

A. Not the Ideal altogether, but the No. 5 would do the same thing.

Q. The No. 5 has a hold-down, hasn't it?

A. Yes, after I got mine. I had heard of Mr. Snow's device before I invented my own. An operator told me about it, but said that it was not working very successfully. I do not know of any factory where Snow's device was used. Snow was working at Whitman & Kieth's when I went there, and taught me to use lasting machines.

1127 We now have three number 5 machines and seven Ideals which are working. We have two Ideals which are not in use at all. We gave up using them about a year ago. We were then running more shoes through our factory than we are now. We did not put on any machines to take the place of the two Ideals that are now idle. We did not get the number 5's to take the place of some Ideals. We increased the business from about 700 to 1,200 pairs. I wanted more machines so I took two Ideal machines first. They gave me my choice. At one time we had nothing but Ideals. Then I got three number 5's and then I stopped using two of the Ideals.

Direct examination resumed:

About four years ago when we started in doing more business, I was given my choice between the Number Five and the Ideal, and I took two Ideals. Before the hold-down appliance was added, it required much more trouble and attention to last a shoe properly. I had to keep after the operators all the time, regulate the machine myself, put pressure on the heel pads to see that I

could hold them down there and make them press on the shoe while they were trying to last the toe.

Q. Could they last as many shoes on the machine without the appliance as with it?

A. I don't think so; no, sir; couldn't do it.

Q. Then that helps some in the speed of the machine?

A. Helps the speed and helps the bother. I don't have any bother. I don't have one tip bowed in a month now, whereas before I would get a dozen shoes in a case.

The appliance on the No. 5 is substantially the same as my appliance.

1128 FEBRUARY 4, 1914.

WARREN F. MCELROY, witness for the United States, recalled:

My full name is W. F. McElroy. I live in St. Louis and am a shoe manufacturer. I was engaged in that business for fourteen years prior to 1899 with the Hamilton-Brown Shoe Company and was general superintendent for the last nine years. Prior to the formation of the United Company our machines were repaired very largely by our own machinists. A representative of the old companies would call about once every thirty to ninety days—rather more of a social call than anything else. As to whether the service with respect to keeping machines in repair has improved any since the formation of the United Company, since the United was formed they have practically kept men in the factory. Prior to that time we kept our own machines in repair. As to the difference between the service when we furnished our own machinists and the service since the United Company was formed, we kept the machines running before; they have kept them running since. They furnish very much more service than we ever put on to our machines—than we ever used before. They have a corps of men to come into your factory at any time of the day and all times of day to look over the machines.

As to comparing the expense of keeping the machines in repair prior to the time the United Company was formed and after it was formed, I couldn't give anything authentic on that at all, because I have made no comparison of figures.

We used three Ideal lasters on women's welt work in 1896–7.

I have been engaged in the shoe manufacturing business since 1884, and was connected with the Hamilton-Brown Company about twenty-seven years. I am now general superintendent with Burrow, Jones & Dyer. As to whether I have anything to do with the machinery, just a general overlooking of the factory. That also was true during the fifteen or sixteen years I had a

similar position with the Hamilton-Brown Company. I do not think it necessary for a factory to have all its machines from one manufacturer in order to get efficient service.

1129 We had no trouble in the Non-Royalty factory which I operated from May to February, in keeping our machines going, without the service of the United Company. The machines were new and our experience in there was not sufficient, perhaps, to test out the machines as they might have been later. We got those machines from various companies other than the United Company—no two from the same company. In 1905 I was with the Hamilton-Brown Company. That company had lasting machines on which the leases had been canceled and the machines turned over to it. That is, we bought the machines. It had other lasting machines on leases from the United Company. I can not say whether that company had any lasting or heeling machines on unrestricted leases of the United Company.

I understand that the Universal Machine Company and the Champion Machine Company are one and the same concern. I have been in their factory. Both companies are located in the same building. We used in our Non-Royalty factory some Universal machines obtained from the factory where the Champion machines are made.

Cross-examination:

The Hamilton-Brown Company used the Ideal machine for lasting women's shoes. It used the Copeland Rapid for lasting men's shoes until 1904.

Direct examination resumed:

I know nothing of the American Shoe Machinery and Tool Company. The James Clark Leather Company are engaged in the business of shoe findings; they make no shoe machinery.

The Hamilton-Brown Company from 1900 up to 1910 were the largest shoe manufacturers in the world.

Cross-examination:

I am the son-in-law of Mr. Brown, senior, who was a member of that firm. Mr. Brown, who testified here for the defence, was my brother-in-law. I was connected with that company

1130 before my marriage—as general manager of the manufacturing in St. Louis—4 factories. I was general manager from 1892 till 1911. Then came the Non-Royalty Co. and then I went with another concern. The output of the Hamilton-Brown Company was about 200,000 pairs of shoes weekly, or about 25,000 to 30,000 pairs per day at our highest point. Since then several other manufacturers have passed them. I had

charge of their four St. Louis factories. When I first went with them they were making about three hundred pairs per day.

Q. Now, as general manager, were you in sole charge of the supplying of the factory with machinery?

A. All, except finally they built other factories—they built another factory, and, while I helped to equip it—while I did equip it, after the superintendent of that factory, which was the Sunlight——

Q. Was there a St. Louis factory that you had charge of?

A. I had charge of four St. Louis factories.

Q. You had to do with the getting of machinery for that purpose?

A. Yes, sir.

At that time the United Shoe Machinery Company was practically the only source of supply of machinery with which I was familiar. Until I started out to equip this Non-Royalty factory I had not made any particular inquiry through the United States to acquaint myself with the persons who were engaged in manufacturing shoes. Before that I had dealt practically altogether with the United Company. When we started to equip a non-royalty factory the object was to get machines on which there was no royalty, no matter of whom it was obtained. Our intention was to keep as far away from royalty machines as possible, and that was the distinction we were then making. That was the occasion for our making inquiries with reference to who supplied shoe machinery. My investigations to get machines for the Non-Royalty Company began about the first of December, 1911, about the time this suit began, and I was engaged in getting machinery until probably June of 1912.

Direct examination resumed:

I know nothing of the Consolidated Rotary Rounder Company, of Cincinnati, or of the Elliott Manufacturing Company, of Boston. The Louis G. Freeman Company, of Cincinnati, are engaged in handling shoe findings and machinery. They have several machines. They are angaged in the shoe machinery business, but I do not know to what extent. They have a St. Louis branch, and the machines I obtained I got through that branch. I had from them a heel tacking machine used in conjunction with the laster.

I have never heard of the C. E. Hardenbrook Company, of Philadelphia; the Progressive Shoe Machinery Company, 1131 of Minneapolis; J. D. Randall Company, of Cincinnati; Theodore Ringenbach, of Cincinnati; the Shoe Manufacturers Supply Company, of Newark, New Jersey; the Supply

Machinery and Tool Company, of New Haven, Connecticut; or the Specialty Shoe Machinery and Tool Company, of St. Joseph, Missouri.

The Landis Machine Company, of St. Louis, makes harness machinery. I do not know whether it is engaged in making shoe machinery.

I have heard of the Atlas-Werke-Pohler and Company of Leipzig, Germany. I don't know whether they do any business in the United States. I have never heard of the Adrian and Busch concern of Frankfort am Main, Germany, of Dilley & Sons, Northampton, England, Heaton's (Ltd.), of Leicester, England. I don't identify A. H. Johnson, of Leicester. I have heard of Gimson & Company, of Leicester, but I do not know whether they do any business in the United States. I have visited the works of A. Johnson, of Paris, France. I do not know whether he does any business in the United States. I have never heard of Keats & Bexen (Ltd.), of Stafford, England, of Keats Machinery Company, of Germany, H. Keeper, London, England, of the Job Lee Premier Works, of Kettering, England, of Lintz & Eckhardt, of Berlin, Germany, of Livingston & Doughty, of Leicester, England, of Stephen Lucking, of Chester, England, of Mills & Company, Ltd., of Kettering, England, or Mobbs & Lewis, of Kettering, England. The Moenus Machine Works of Frankfort, Germany, manufacture shoe machinery and tanning machinery; I do not know whether they do business in the United States. I have heard of the Nollesche Works, Germany, but do not know what business they are engaged in. The Northampton Machinery Company (Ltd.), of Northampton, England, are engaged in the shoe machinery business; I do not know whether they do any business in this country. I never heard of A. T. Ralphs, of Leeds, England. The Standard Engineering Company, of Leicester, England, make some types of shoe machinery; I do not know whether they do any 1132 business in the United States. The Standard Rotary Machine Company, of Rushden and Northampton, England, manufacture stitching, lasting, and leveling machinery. It did a small nonroyalty business in this country. We bought lasters, stitchers, rough rounder, and leveler from them. They had no agent in this country at that time. I never heard of Summers & Sons, of Wellinborough, England, of John Thacker, of Leicester, England, of Timson, Bullock & Barker, of Kettering, England, of the Universal Shoe Machinery Company, of Northampton, England, of the Velocity Machines Company, Ltd., of London, England, of Ward & Gent, of Northampton, England, or of Whitehead & Company, of Dunkinfield, England.

Cross-examination resumed:

As to whether, if I know anything about these people, I ought to know about the people in my own city, I should say so; yes sir. I have lived in St. Louis a good while. I said that the Landis Manufacturing Company, of St. Louis, made harness machinery. As to whether I know that, I know it from their advertisements. I have never seen their catalogue or been in their place of business, which is on North 25th Street, St. Louis, Missouri. I have seen their harness machine. I know they make harness machinery. I don't know whether they make anything else. I don't mean to say that they don't make shoe machinery.

1133 FEBRUARY 5, 1914.

PEARL E. SELBY, witness for the United States, recalled.

My name is Pearl E. Selby. I am connected with the Selby Shoe Company, of Portsmouth, Ohio. I was engaged in the shoe manufacturing business before the formation of the United Company and have been engaged in that business down to the present time. With respect to keeping our machines in repair, I would prefer to furnish my own service.

The operation of the lasting machine has nothing to do with the operation of the welt sewing machine. The operation of the welt sewing machine has nothing to do with the operation of the outsole stitching machine. The operations are performed by separate operators on different machines. The same is true of heeling machines. I do not know whether in 1905 I had any lasting, heeling, or metallic fastening machines from the United Company on what are designated as unrestricted leases.

(No cross-examination).

1134 FEBRUARY 5, 1914.

WILLIAM F. FOWLER, witness for the United States.

My name is William F. Fowler. I live in Cincinnati, Ohio. I am connected with the Krippendorf-Dittman Company, shoe manufacturers. I am a stockholder in the company and am superintendent. I have been with the company substantially all of the time since January 26, 1873.

Prior to the formation of the United Shoe Machinery Company agents of some of the constituent companies would visit the factories in a given city perhaps once a month. The old Goodyear Company had offices in Cincinnati part of the time where their agent was stationed. The service given by the United Company is now better than that which was rendered prior to the formation of the United Company. We formerly had 4 or 5 Ideal lasting machines, which we got before the formation of the United

Company. We used them on women's welt shoes, which are the only kind we make.

(The United States then offered to prove that the witness had obtained two Ideal lasting machines from the Goodyear Shoe Machinery Company on a lease under which he paid five hundred dollars for each machine at the time of getting the machines and was not obligated to pay any further royalties; that a few years after the United Company was formed he turned those machines back to the United Company, receiving an allowance of two hundred and fifty dollars on each of them and took Consolidated hand method machines in their place; that thereafter applying for an Ideal lasting machine, he received one from the United Company but was compelled to pay a half cent per pair for its use; that as a result the witness now pays approximately three hundred dollars per year royalty, and he takes the machine for a period of seventeen years, for the use of the machine which has an output of from two hundred to two hundred and fifty pairs per day, instead of having it for five hundred dollars for a full term. The evidence was excluded on the ground that the lease should be produced. The witness stated that he did not have the lease with him, but that it was in his office.)

1135 Cross-examination:

We never used our Ideal lasting machine on anything but women's shoes.

1136 FEBRUARY 5, 1914.

A LE ROY HAMMOND, witness for the United States.

My name is A. Le Roy Hammond. I live in Haverhill. I am connected with the Becket & Hammond Machine Company. We make a wood heel top lift trimming machine, used for trimming the top lifts of wood heels. We sell it to wood heel manufacturers—to anyone that makes wood heels. We employ about ten men.

Cross-examination:

The catalogue which you show me on the reverse side of page 175 of defendants' Exhibit 321 is our catalogue. Some shoe manufacturers use wood heels in making some kinds of shoes. We sell our machines to any shoe manufacturers who want them. We have been in business eight years.

1137 FEBRUARY 5, 1914.

AARON BECKMAN, witness for the United States.

My name is Aaron Beckman. I live in Lynn. I am in the machine business. My company is the Beckman Machine Company, which makes heel-finishing machine. We have put out about nine machines since we have been in business, that is

to say, since the first of May, 1913. I made heel-finishing machines before that, but didn't have a shop of my own before. We do not make a heel-seat beading machine, and have never handled them. I employ about two men.

Cross-examination:

The advertisement which you show me from defendants' Exhibit 321 is my advertisement and the cut on the reverse side of page 111 illustrates our heel burnishing machine. That machine also had a heel beading wheel, and the same with another device was a heel beader as well as a heel burnisher; I did furnish to the market a heel beading machine. I was putting this machine out as long as two years ago. At that time I was not working for myself.

Four of these machines have been put into Creighton's factory in Lynn, displacing those of the Xpedite Company. That is, it does the same kind of work as the United Company's Xpedite machine.

Direct examination resumed:

I don't know whether that company has given up the use of the United's machines. As far as I know that company may still be using all of the United Company's machines which it had. I don't know. I have put out nine of these heel-seat beading machines of this later type. I employ two men.

1138 , FEBRUARY 5, 1914.

HARRY H. BECKWITH, witness for the United States.

My name is Harry H. Beckwith. I live in Boston and am connected with the Beckwith Box Toe Company. We make a toe softening machine, which is used to soften the box toes in the lasting operation. We have been engaged in business about ten years, and we have put out about two hundred of these machines. They have all been put out in the past two years, and about one hundred of them in the last year. The United has a machine for performing a similar operation.

Cross-examination:

We got up this machine only two or three years ago. Since then we have placed two hundred machines. It prepares the box toe for the lasting operation.

1139 FEBRUARY 5, 1914.

HARRY I. ILLINGWORTH, witness for the United States.

My name is Harry I. Illingworth. I live in Swampscott. I have been in business since 1895. I am manager of the Boston Machine Works Company. We manufacture shoe machinery, special machinery, and tools. We make the Monarch and the Boston beading machinery for beading the tops of shoes, the

Julian cementing machine, used for cementing the soles of shoes, and the New York fold cementing machine, used for cementing the edges of skived leather before folding. We have put out during the last ten years seven or eight hundred Julian cementing machines. They have gone to shoe manufacturers. We make folding machines, the Booth folding machine, used for folding the edges of the upper; the Boston machine, for similar work of a heavier character; a foot-power machine for small pieces, such as backstays; and a vamp machine, which is a special machine for folding the vamp. We make the Rochester lacing machine for lacing the upper to give the proper opening before being lasted, and marking machines for marking leather; a lining pricking machine; a snipping machine, used for snipping the edges of curves of the upper leather before folding; a tip scouring machine, and a flap-slashing machine, used for slashing the curves in the shank of the insole. We have put out perhaps fifty flap-slashing machines. They were principally sold in this country. The Julian cementing machines were nearly all—about 90%—sold in this country. We formerly made a hook-hole punching machine, but do very little on it now. It was used to prepare the upper for setting of the hooks. We handle the Union Seam rubbing machine, but do not make it. We have the exclusive sale of it. It is used for pressing the seams of the uppers. The British United Shoe Machinery Company handles certain of our machines in England and the German United Shoe Machinery Company handles them in Germany.

1140 Cross-examination:

We market all our own machines in this country. Our place of business is in Lynn. We occupy about 25,000 feet of floor space. We have a treasurer's office in Boston, and branch offices in St. Louis, Cincinnati, Rochester, and Auburn, Maine, where we sell our goods. We employ about a hundred people at our Lynn factory.

We make an insole pinking machine which pinks the inner sole of a pointed shoe preparatory to attaching the sole to the upper.

The catalogue which has been produced, which is part of defendants' Exhibit 321, is our catalogue, and we put it out. We hold ourselves ready to supply all of the machines named in it.

Direct examination resumed:

We employ 100 men, more or less, altogether. It is difficult to state how many men we employ in connection with our cementing machine, because sometimes we make up a lot of them, and we might not make any more for several months.

1141 FEBRUARY 5, 1914.

CHARLES G. WIRTHS, witness for the United States.

My name is Charles G. Wirths. I live in New York. I am secretary and treasurer of the Larsen Machine Company. We make a welt and out-sole lockstitch machine. It is used principally by shoe repairers. We have never sold any to shoe manufacturers. It could be used by shoe manufacturers but it can not be speeded up as high as the United Company's machines.

Cross-examination:

The advertisement which was produced to the court was an advertisement of our Larsen Ever-Ready stitcher. The statements which we make in that advertisement regarding it we believe to be justified. There is no reason why it could not be used for making new shoes except that it is not as fast as a Goodyear stitcher. That is considered by manufacturers a serious difficulty.

Direct examination resumed:

The advertisement which was produced was inserted by the Engstrom Company. As to whether or not it was our advertisement—well, practically, no. We have never known of one of these machines being used in a shoe factory.

Cross-examination resumed:

The advertisement does advertise our machines.

Q. And in so far as we are concerned, who didn't know who paid for it, we were perfectly justified in understanding that that was your advertisement?

A. Exactly, sir.

1142 FEBRUARY 5, 1914.

CARL A. MATSON, witness for the United States.

My name is Carl A. Matson. I live in Lynn. I am connected with the Matson-Hoyt Machine Company. We make a heel-finishing machine. We have put out about a dozen, all within the last three years. They go to shoe manufacturers.

Cross-examination:

We advertise the Matson heel burnisher as shown on the reverse of page 8 of defendants' Exhibit 321. We furnished one of these to the Non-Royalty Company in St. Louis. We sell directly to shoe manufacturers.

Direct examination resumed:

We employ two men.

1143 FEBRUARY 5, 1914.

CHARLES T. HILLIKER, witness for the United States.

My name is Charles T. Hilliker. I live in Lynn and am connected with Quarmby & Hilliker, machinists. We make a Knox power blocking machine which is used in blocking out or cutting

the leather for soles. The machine shown in our catalogue, which is a part of defendant's Exhibit 321, is what we call our sole cutter. We have put out approximately thirty of these machines since we have been in business. They go to sole manufacturers. We have put out perhaps ten or twelve lighter machines which have gone to shoe manufacturers. We now handle them only when we can pick them up as second-hand machinery. We formerly made a Knox heel-compressing machine but have not manufactured any for the past seven years. The machine in the corner of our letterhead, which is in defendant's Exhibit 321, is a sole cutter and a blocker. Then there is another machine very much like this which we call a dieing-out machine and a blocking machine besides. We have made a sole-molding machine, but have discontinued its manufacture. We make a Knox rolling machine used for rolling out all kinds of sole leather. We have put out about fifty of them since we went into the business in 1904. About one-third of them have gone to shoe manufacturers, the rest to people who furnish stock for shoe manufacturers. We make and have put out at least seventy-five stripping machines for stripping side leather, to be used in the blocker. About one-third of them have gone to shoe manufacturers. The others have gone to outsole makers. We do not make a Knox splitting machine. We buy them of the Knox Splitting and we also handle them as second-hand machinery. We have put out about thirty; about half go to shoe manufacturers. We employ from seven to ten men. The United Shoe Machinery Company makes a stripping machine, a blocking machine, a molding machine, and a rolling machine.

1144 Cross-examination:

The letter on page 10 of defendant's Exhibit 321 giving prices on the machines about which I have been asked is our letter, and our catalogue is that which was produced and is attached on the reverse of page 11. We have the patterns and could make any of the machines named if we were asked to. We do not advertise.

Outsole makers make soles for shoemakers. Quite a number of our machines go to outsole makers.

We have made between one hundred and fifty and two hundred dinking machines. We sell them everywhere.

Direct examination resumed:

About one-third of them went to shoe manufacturers.

Cross-examination resumed:

The others go to persons making parts for shoe manufacturers, such as soles or linings or uppers.

1145 FEBRUARY 5, 1914.

RICHARD H. LUFKIN, witness for the United States.

My name is Richard H. Lufkin. I live in Boston. My business is the manufacture of vamp folding machines. I have been in business for thirty-five years. The machinery has nothing to do with the bottom of shoes. I have talked with Mr. Bayley, who is connected with the United Shoe Machinery Company, with respect to selling my business to that company. He asked what our price was, and he afterwards said it was too high; he could not do anything with it.

Cross-examination:

The letter and advertisements which you show me (defendants' Exhibit 321, page 84) are mine.

1146 FEBRUARY 5, 1914.

FRED F. FIELD, witness for the United States.

My name is Fred F. Field. I am a shoe manufacturer connected with the Fred F. Field Company, of Brockton, of which I am president, and Field Brothers & Gross, of Auburn, Maine, of which I am vice-president. The Fred F. Field Company manufactures men's welt shoes. They have been in business for fifteen or sixteen years, beginning with a capacity of four hundred and eighty pairs a day, which has gradually been increased until within the last four or five years we have been making twenty-five hundred pairs. I formerly used the Eppler welt machine, and at one time had as many as eight of them. At the same time we had Goodyear machines. We never had any Eppler outsole stitchers. We kept the Eppler machines in our factory from 1902 or 1903 until a year ago. We got them after the organization of the United Company. We had 5 or 6 Epplers when I ceased using the Eppler machines, because I felt the model K welter was a better machine. While we were using those Eppler machines, we were, during all the time, using some Goodyear welters. I have been general manager, and have had oversight of everything. I thought the Eppler machines sewed a flatter seam than the Goodyear, and required less filling. There was not much difference in speed between the old Goodyear and the old Eppler machine. As to which of the machines our factory preferred—the old Goodyear machine or the Eppler machine—we put in the Eppler because we thought it was better. As to our reason for ceasing to use the Eppler and taking the Goodyear machines before the model K machine came out, the seam sewed by the Eppler was a little weak as compared with the Goodyear, but it was a flatter seam, and we were wanting to try the new machine as soon as it was out. We

had tried another model in the Maine factory first. In our Brockton factory we make men's high-grade shoes.

Cross-examination:

We were in business making welt shoes before 1902 and at that time used Goodyear machines and had used them
1147 for some time. The United Company supplied us with Eppler machines in 1902. The United Company furnished us whichever we chose and furnished us with service. They treated us just as well when we had the Epplers as when we had the Goodyear, and took just as good care of the other machines. We did not make any turn shoes nor any women's shoes. I do not know anything about whether an Eppler machine can't make a turn shoe satisfactorily. We never had an Eppler stitcher, but did that work with a Goodyear machine. We used the Eppler for one seam and the Goodyear for the other. The Eppler machine sewed a somewhat looser and weaker seam than the Goodyear. If the United Company hadn't furnished us with a Goodyear machine for doing outsole stitching, we couldn't have made a shoe with our Eppler machine. We could only have sewed the inseam by machine and would have had to stitch the outsole by hand. We did not ask for a set of the Eppler machines for doing the entire operation of welt sewing. We just asked for the welter. I don't think we had any Eppler auxiliaries. That is, we had five Eppler welting machines which were assisted and helped out by the Goodyear machines that completed the operation of uniting the sole of a welt shoe to the upper. At that time we felt we liked the Eppler welter better. I determined to change the Epplers for Goodyears some little time before I actually made the change, but was advised by Mr. Willson to wait until they got the model K ready, although he was ready to change.

Direct examination resumed:

We wanted to make the change because the newer machine was faster, and we thought it did a better job than the Eppler. That was our only reason for making the exchange. I made the exchange about four or five years ago. At that time they had a new model out, but Mr. Willson advised me not to put that in, as they had been working on another one, for which he thought I had better wait. I never have used any of the Eppler machines except the welter.

1148 FEBRUARY 5, 1914.

GEORGE STRONG, witness for the United States.

My name is George Strong. I am a shoe manufacturer. My factory is located in Weymouth. I have been making men's

high-grade welt shoes for about thirty years. We make about fifty cases a day. About 1892 I began using the Eppler machines. At first we used the out-sole stitchers, sewing our welts by hand, our grade of shoes. Afterwards we used the Eppler welter also. We are using the Goodyear outsole stitcher to-day. The Eppler stitching machine did satisfactory work on our grade of shoes. I think we got along better with it than if we had used the welter at that time. We welted by hand. We began using the Goodyear welting machine about 1900. The old firm dissolved and we had a new corporation, and I think we put in—in 1895 I think we put in Eppler stitchers and welters then. We used Eppler welters and stitchers from about 1895 to about 1900. Then we made a trade with the United Company and let them have our Eppler system, welters, stitchers, and some other machines, and took Goodyear machines. It is pretty hard for me to go into the practical part, because that was not my part of the business. I was not a factory man at all. I just looked after the correspondence and accounts and the sales. The machine had been used a long time, and were practically gone by, and we had a chance to turn them in to the United Company for the new rapid stitcher and welter, and we did so. I think the Goodyear machines do better work than the Eppler machines. Of course, I think the Goodyear welter is better than the Eppler welter was. You can do more work on the rapid stitcher, of course. You get a flatter seam on the Goodyear welter. In the Eppler the lock was on a different plan. I think our Eppler machines were leased. I do not know the amount of royalty, whether it was three or four cents.

1149 FEBRUARY 5, 1914.

JOHN JORDAN, witness for the United States.

I am a laster, and am now employed by the W. L. Douglas Company, for whom I have been working for seven or eight years. I formerly worked on the Chase laster at the George E. Keith factory. I do not remember in what years—a couple of years off and on. I also worked for three or four years on the Copeland rapid laster, and afterward with the Ideal lasting machine, which I ran for about ten years, when they put in the Number Five; that was about three or four years ago. I am working on the Number Five machine now.

I lasted men's high-grade welt shoes on the Chase, the Copeland rapid laster, and the Ideal lasting machines. I think the Ideal did better work than the Chase on men's shoes. It got a better shoulder and smoother toe, and one thing and another. I worked on the Ideal machine when it first came out 10 or 12 years ago,

in the factory of Whitman & Keith. It was installed therefor experimentation. That particular machine did high-grade work on men's welt shoes. As to whether the most work could be done in a day by the Ideal or by the Chase—well, I don't know. That is left with the operator, but I would say that the Ideal was a little speedier.

Cross-examination:

The speed with which an operator can last shoes depends a good deal upon the shape of the last. The introduction in recent years of the crooked last and of the high-toed shoe has
1150 slowed down the work of the laster a good deal. I do not know that a comparison of the present machine with the older machine is fair. They were using easier lasts when I worked on the Chase machine. There were no crooked lasts then. Now there is a right and left last, which requires a different kind of machine. The high box toe requires a differently adjusted machine.

When I worked on the Ideal machines at George Keith's they did not have the hold-down on the machine. My recollection is that I left Keith's about eight years ago, in 1906. I operated the Ideal and not the Chase laster at Keith's. I used the Ideal machine for five or six years. I know Stephen Snow. I do not remember any device such as he described on George Keith's Ideal machines. I have run machines at Douglas's with that attachment eight or nine years ago. They didn't use it but a short time. It did not hold the shoe. I do not remember that the hold-down attachment was ever used at George Keith's.

Direct examination resumed:

I never saw Mr. Keith lasting any shoes.

The Snow attachment was used for only a short while at Douglas's. They were then taken off, and the machines then used without the attachments.

1151 FEBRUARY 5, 1914.

JOHN N. MURPHY, witness for the United States.

My name is John N. Murphy. I am an operator on lasting machines. I first was employed about twenty-three years ago in the factory of Perkins & Joyce, at Brockton. In that factory I operated the old Copeland. That was not the Rapid machine nor was it the old McKay & Copeland. It was a strap machine. We were making a fair grade of men's welt shoes. I next worked at Taylor's factory at Campello, operating the same machine. That was in 1893. They were making a medium grade of men's welt shoes. From there I went to the factory of Whitman & Keith where they were making the same kind of shoes—welt

shoes; I guess some of them were a higher grade. I operated there the strap machine and the power machine, or the Ideal. The power machine was the Ideal machine. When it came out with power first they called it the power machine. I afterwards worked at Douglas's where I operated the Ideal machine. I never operated a Chase machine at all to amount to anything; I may have tried a shoe on it. They had some in Douglas's factory while I was there. I tried to operate it once at Cross', but could not make it go. I can not say whether the Chase machine was used on welt work at Douglas's. I didn't see much difference between the work of the Chase and the Ideal machines. The operator on the Chase was away down the other line, lasting McKay work. I have used the Number Five lasting machine. In regard to a job, I guess the two machines were about the same. I thought the Ideal was a quicker machine. I have not operated a lasting machine for nearly two years. I am making shoe forms now.

(No cross-examination.)

1152 FEBRUARY 5, 1914.

FRANCIS O'KEEFE, witness for the United States.

My name is Francis O'Keefe. I am foreman of the lasting room for Stacy, Adams & Company. I have been working in that capacity for two years. I have been engaged in lasting shoes for about eighteen years. I first worked with L. Boyden & Company, Newark, New Jersey, in 1896. They were making high-grade men's welt shoes. I used a Chase machine there for about six years. From there I went to James A. Banister & Company, of Newark, New Jersey, who made men's fine welt shoes. They also used the Chase lasting machine. From there I went to Syracuse, New York, where I worked for Nettleton. He also made men's fine welt shoes, and used the Chase machine. From there I entered the employ of Stacy, Adams & Company, in Brockton, and worked there for five years operating Chase lasting machines. I have worked a short time on the Number Five, but have never operated the Ideal. Stacy, Adams & Company never owned any Ideal machines to my knowledge. I have used the Chase lasting machine in lasting women's shoes at the factory of L. Boyden & Company. They made a line of women's shoes for a short time—then discontinued making them. Chase lasting machines were successfully used in lasting those shoes. The Chase could not be used on a high-toed shoe like those which have been out in the last three or four years. It was just as good as any other kind of machine I know of for regular work. Banister had six Ideal machines, on which

men's fine welt shoes were lasted. He used them during all the three months I was working there. He also had six Chases, on which I worked. A workman on the Ideal turned out about the same amount of work as that which was done on the Chase. As to whether I examined the work to see whether it was as good; well, it all had to be good; it wouldn't go if it wasn't.

1153 Cross-examination:

Each of the five factories at which I worked used Chase machines for lasting men's shoes. In the Banister factory men's shoes were lasted on Ideal machines in the same room where I was at work, although not done by me. I have picked the work up and looked at it, but gave it no particular attention—had no responsibility for it. All the factories where I worked make the very highest grade of machine-made shoes. I don't know whether they are the best grade of machine-made shoes which are in the market. It is true that Newark is famous for its fine shoes, and this is one of the factories that made fine shoes.

At none of the places at which I worked, except L. Boyden & Company, were women's shoes made. L. Boyden & Company used Chase machines for lasting women's shoes. They discontinued making women's shoes. I have lasted shoes made on crooked lasts on Chase machines and on the Number Five. On the Number Five the part which holds the heels is movable, so that it can be adjusted to a crooked last. The similar part on the Chase machine is stationary. That would not make any difference.

1154 FEBRUARY 5, 1914.

MILTON S. FLORSHEIM, witness for the United States, recalled.

My name is Milton S. Florsheim. I testified last spring. I reside in Chicago. I am connected with the Florsheim Shoe Company, manufacturers of men's shoes. I have already testified that at the time the United Company was formed I was manufacturing shoes and was using both the Eppler and the Goodyear machines. We used both the Eppler and the Goodyear welt-sewing and outsole stitching machines, and I think we used the Eppler auxiliary machines, at least their rounder. In our opinion the work performed by the Eppler welt-sewing machine was as well done as the work performed by the Goodyear machine. The same thing was true of the outsole stitching machine. The best shoes made at that time or as good as any made at that time were made on the Eppler machines. We made a high-grade shoe at that time, though not so high priced as the one we are making to-day. As to whether the character of the work, in

my judgment, was the same—practically so. Prior to 1899 we had not made any large quantity of shoes; we had only made a limited quantity, but had experimented with the machines and had satisfied ourselves that as far as their work was concerned we could get along with them as well as with the Goodyear. That is about all the progress that we had made up to the time the United Company was formed. Right after the United Company was formed we stopped using the Eppler machines. We got satisfactory service both from the Goodyear Company and from the Eppler Company. We also got satisfactory service from the companies furnishing the lasting machines. We had Chase and Copeland Rapid machines at that time, and both companies furnished us satisfactory service. There was no substantial difference between the service which was furnished before the consolidation into the United Company and that rendered by the United Company afterward. We have never made any effort to take care of our own machines.

1155 Cross-examination:

I can not say when I got my first Eppler machine. My memory is that we got them between a year and six months before the United Company was formed. As to whether the fact is that the first Eppler machine we ever had was shipped to us November 21, 1898, I don't know. I do not deny it. All the opportunity we had to know about the service of the Eppler Company was between the date of that first machine, whenever it was, and February, 1899. Prior to February, 1899, we had a wire grip slugging machine. I do not know the name of the company from whom we got it or our other slugging machines. It may have been one of the machines of the McKay Shoe Machinery Company. I don't know. I can not say how long we had it before the United Company was formed. As to what I had to do with the machinery at that time that gave me an opportunity to know about the service those companies gave us, I had practically charge of our little business at that time.

Q. Where was the McKay depot or agency out there that furnished service to your factory?

A. I don't know. I think Mr. Forsyth at that time, the present manager of the United Company's office in Chicago, represented one of the slugging machine companies that we did business with.

Q. Just wait a moment. I say, where did the McKay Company have its office or agency which furnished you that service?

A. I don't know; somewhere in Chicago.

Q. Well, do you know that?

A. Well, they had a representative there.
Q. Do you know that?
A. No; I can't say that I know that.
Q. I want to be sure that you do know what you say and not have you merely guess at it.
A. I am not guessing.
The Eppler Company also had a representative in Chicago; kept parts there; and someone was present who could repair machines. The Goodyear Company also had an agency in Chicago. The United Company's services improved as time went on and became very much more efficient, and after they had gotten started and organized and got their service systematized it was very much better than what was given before, and it has been improving right along; their service has been good.

1156 Q. Of course this is the fact, that where one agency, one corps of men furnish the service for all your machines, it is obvious that it is easier and simpler and quicker for you as a manufacturer to call upon that one central depot than it is to call upon six or eight or a dozen different people.
A. That necessarily must follow by itself; but, on the other hand, let me say this, Mr. Choate: That the way the United Company run their business, if a man that repairs heeling machines, for instance, is in the factory, and we need a man to repair the Goodyear, he won't repair the Goodyear machines. We have got to send again and get another man. They divide their service up to such an extent that it takes a great many more men.
Q. But you send to the same place for them all?
A. Yes, sir.
Q. And they have a good many more men?
A. Oh, yes; they give us good service, if that is what you are trying to get at; there is no question about it.

1157 FEBRUARY 5, 1914.

IRA E. FLETCHER, witness for the United States.

My name is Ira E. Fletcher. I am superintendent of the F. M. Hoyt Shoe Company, of Manchester, New Hampshire. I have been with them four years. I worked for W. L. Douglas from 1902 to 1910. In 1902 Mr. Douglas was using both the Eppler and the Goodyear welt machines. I think he had about twelve Eppler machines and eight Goodyear machines. I am not sure how long he retained the Epplers, but I think for about three years after I went there. I do not know how

long he had been using them before I went there. They ran side by side in the same factory. The Goodyear welter was the best. Douglas was using the stitcher as well as the welter. The Goodyear stitcher we considered the best. As to what I had to do with the stitchers, I had full charge of the making room. The Eppler welter put the loop on the inside and the Goodyear welter put the loop on the outside. Both the shoes made on Eppler machines and those made on the Goodyear were put on the market and were all sold as welt shoes. They were not kept separate.

Douglas was using Ideal lasting machines, and I think he had fifty-four of them in 1902. He was then making men's welt shoes only. He afterwards got Consolidated hand method or "nigger-head" machines. We used both machines on men's welt shoes. He used the "nigger-head" on the cheapest grade of shoes. He got no other kind of lasting machine while I was there, except within the last few years they put in some of the Number Fives, the latest and most improved machine.

1158 Q. I want to draw a comparison between the work done by the No. 5 and the Ideal.

A. The No. 5 is superior to the Ideal.

Q. In what respect?

A. You have a hold down and also a finger that holds the shoe to the extreme point of your inner sole, which is a benefit.

The hold down had been put on Mr. Douglas's Ideal machines by Mr. Snow, I think in 1905. Before that the Ideal had been used for a number of years without the attachment. Mr. Snow's appliance was successful in a way. I worked for Cushman & Company, of Auburn, Maine, from 1894 to 1901. The first year I was there I was a welt operator, and the remainder of the time I was a foreman. We used the Goodyear welting machines and Ideal lasting machines. Toward the end of my time there they had twelve Ideal machines. They had no other kind of lasting machines in the room in which I was working. In that room, men's Goodyear welt shoes were being made. They tried the Chase lasting machine in that factory for six weeks or two months, but took it out because they could not get as good results on the Chase as on the Ideal.

Cross-examination:

A man familiar with the Ideal laster might find it difficult at first until he was thoroughly trained to do as good work with the Chase laster, and vice versa. The high-toed last began to be used about 1904, I should say. It was started by George Keith in Brockton. I do not pretend to be accurate as to the date, but I know that was where it originated.

I know Stephen Snow, and I know he put hold-downs on the Ideal machines in Douglas's factory. The hold down held the shoe firm. The purpose was to hold down the toes on especially hard stock—heavy stock. Without the hold down
1159 the Ideal machine continually allowed the toe to rise, which caused the tip to pull ahead and to bow. That frequently required repeating the operation and was likely to cause injury, especially in lasting patent-leather shoes. The operator wouldn't get as good results. I wouldn't say that the hold downs were put on more than half of the Ideal machines in the Douglas factory. Douglas did not do any lasting by hand at the time I was with him.

The Number Five machine was a development from this idea of the Ideal with these attachments on it.

Douglas gradually changed from the Eppler to the Goodyear machines, because with the Eppler machine there was trouble with the loose seam. When you beat out the shoe there would be more or less looseness, which caused a weak seam. It would make a bad shoe. That was the particular reason for changing over from the Eppler to the Goodyear. That change was the result of the business judgment of the men who were responsible, because we thought the Goodyears were the better machines.

The shoes made on the Eppler machines and those made on the Goodyear machines were not kept separate. Shoes that were welted and stitched on the Eppler machines were put into a case with shoes welted and stitched on the Goodyear machines with no distinguishing mark whatever.

Direct examination resumed:

Mr. Douglas made some patent-leather shoes at that time. They were lasted on the Ideal machines. I never heard any particular complaint about the way in which they were lasted.

Cross-examination resumed:

Cushman might have had a good many Chase machines in the McKay room, with which I had nothing to do. He did not have any in the Goodyear room.

1160 FEBRUARY 5, 1914.

HARRY G. McMURRAY, witness for the United States.

My name is Harry G. McMurray. I am superintendent of H. B. Reed & Company, of Manchester, New Hampshire. I have been with that company for three years. I worked for Ara Cushman & Company from 1891 to 1893. I do not remember whether they used an Ideal lasting machine. They were then using the Goodyear welt machines. In 1906 and 1907 I was in the factory of Field Brothers & Gross at Auburn, Maine; they were using eight Eppler welt machines. At that time they were

not using any Goodyear welt machines. They made men's Goodyear welt shoes. They used the "nigger-head" lasting machine, but the last of my being there they put in Chase machines. I do not know of their using any Ideal machines and think they changed the Epplers for the United's new machine shortly after I left.

(No cross-examination.)

1161 FEBRUARY 5, 1914.

JAMES H. CUNNINGHAM, witness for the United States, recalled.

My name is James H. Cunningham. I am connected with the Stacy, Adams & Company, in which I am interested. I have been connected with that company in various capacities for thirty-nine years. I was formerly superintendent. We make the highest grade of men's welt shoes. We first made welt shoes by hand. About thirty years ago we began making welt shoes by machinery. At first we used Goodyear machines. The Eppler was not out then. As to whether we ever used any Eppler machines in our factory, we did; yes, sir. In 1899 we were using Chase lasting machines. We never used the Ideal machines.

(No cross-examination.)

1162 FEBRUARY 5, 1914.

HARRY G. MCMURRAY, as a witness for the United States (recalled).

I wish to correct my testimony with respect to the welt sewing machines used by Field Brothers & Gross in 1906 and 1907. The machines used by that company were not Eppler machines, but were Briggs welting machines. That is all I know about them.

Cross-examination:

I know the machines were called the Briggs welting machines and that is all I do know. As to how that name happened to be given to those machines, I understood at that time that Briggs was the inventor.

Redirect examination:

I do not know whether they got them from the Goodyear Company.

(At the suggestion of Mr. Fowler, it was then stated by Mr. Choate that it was his understanding that the machine referred to as the Briggs machine was in fact the Goodyear model E.)

1163 FEBRUARY 5, 1914.

IRVING A. HADLEY, as a witness for the United States (recalled).

My name is Irving A. Hadley. I was formerly connected with the firm of Kimball & Hadley, which I have testified sold

out to the United Shoe Machinery Company. I have formerly testified with reference to an endeavor to sell awls and needles to the firm of Churchill & Alden's. Mr. Belcher, who has testified here, was the person with whom I talked. I saw Mr. Roberts of the E. E. Taylor Company, and he is the man I talked with regarding slugging awls. Regarding the needles, it was another party; I don't recall just who it was. I do not recall the names of either Mr. Tierney or Mr. Bryant. The conversation in which as Mr. Belcher testified I told him I was going out of business was not in connection with Kimball & Hadley, the co-partnership which was sold out to the United Company, but was with respect to the Kimball Hadley Corporation. It was after the copartnership had been disposed of to the United Company and the corporation had been formed, and between the time of the decision of the single justice of the State Supreme Court and the time that the injunction was made permanent, that I went and told them that there was a possibility of our going out of business and advised them to stock up.

(No cross-examination.)

1164 FEBRUARY 5, 1914.

WILLIAM P. BARTEL, witness for the United States.

My name is William P. Bartel. I reside in Waltham, Mass. I am connected with the American Lacing Hook Company, which manufactures lacing hooks for shoes. The only machine which we make is a hooking machine for placing the lacing hooks in the uppers of shoes.

(No cross-examination.)

1165 FEBRUARY 5, 1914.

FRANK A. BRADFORD, witness for the United States.

My name is Frank A. Bradford. I am manager of the Holmes Leather Working Machinery Company, of Cambridgeport. We make a sole-leather roller, used for finishing sole leather. It is sometimes sold to shoe manufacturers. Most of them are sold to tanneries. The machine has been on the market for eight or ten years. We have sold them to the tanning department of shoe manufacturers. We sold to the W. H. McElwain Company, tanning department; sold some to George E. Keith several years ago.

Cross-examination:

The letter which you produce as part of defendants' Exhibit 321, dated May 20, 1913, and signed by me, quoting prices on machines for smoothing heavy stock, is our letter. That letter appears on page 34 and cuts of the machines appear on page 35 of that exhibit. A good many of the large shoe manufac-

turers have tanning departments, where these machines are used for dealing with leather that is mostly used for sole leather, like the heavy grades of leather which have to be rolled out before the soles are made.

1166 FEBRUARY 5, 1914.

EDWIN E. BARTLETT, witness for the United States.

My name is Edwin E. Bartlett. I reside in Hyde Park. I am connected with the Harlow Shoe Finishing Machinery Company, which makes a heel-finishing machine. I have put out about one hundred and thirty-seven, of which all have gone to shoe manufacturers. Mr. Harlow, who was president of the company, is in the employ of the United Company. I put out personally a heel-seat beading machine. The Harlow Company has nothing to do with it. I build that personally.

Cross-examination:

The advertisement which you produce as part of defendants' Exhibit 321 is our advertisement. It is on page 143.

I do not know what Mr. Harlow does for the United Company. He is connected with the Marlboro office. He has no active part in running the Harlow machine business. The United Company owns no stock or other interest in the Harlow Company and has nothing to do with it. We have been putting out machines for about six years.

1167 FEBRUARY 5, 1914.

WILLIAM J. YOUNG, witness for the United States.

My name is William J. Young. I live in Peabody. I am treasurer of the W. J. Young Machinery Company. I have been manufacturing a heel-building machine for seven or eight years and we are putting it out now. We have put out between two and three thousand heel-building machines. They were practically all sold in this country. At the present time, the larger part of them go to shoe manufacturers. We make the Grover heel building machine. That goes to shoe manufacturers. We make three styles of heel building machines. We put out a buffing machine for buffing counters and box toes; a wedge-strip beveling machine, which makes wedge lifts for use in heels, and which goes to shoe manufacturers and heel manufacturers, probably more to the latter; a heel compressing machine, which is sold almost altogether to heel manufacturers at the present time; a wedge lift-cutting machine for dieing out the wedge lifts from the wedge strips in connection with the heel, which goes to both heel makers and shoe manufacturers; a counter end finishing machine which is used in connection with the counter; a heel-lift gouging machine, which goes to both heel makers and shoe manufacturers about equally; a counter molding machine; a box-toe skiving

machine; a counter-skiving machine; a shank-piece skiving machine; and a spring-heel scarfing machine. We do not build a rand-splitting machine, though we may possibly have handled one or two secondhand, and have not as yet put out a treeing machine. We do put out a waxing and rolling machine for counters. We employ between forty and fifty men.

1168 Cross-examination:

We have been in business for twenty-four or twenty-five years. Our business has been growing. The shoe manufacturing business is sometimes divided up so that one man makes heels and another makes soles, and they sell the heels and soles to the man who makes the shoe; but it is all part of manufacturing the shoe. We lease on a royalty rental our automatic lift-die machine, which has not yet been mentioned, and our counter-buffing machine, and one or two machines for molding the heel seat. The others we sell. We have put out two or three thousand heel-building machines, three or four hundred counter-molding machines, over three hundred heel-compressing machines, and one hundred and fifty to two hundred lift-gouging machines. All except the heel-builder have a pretty large capacity. The advertisements which you produce (pages 61, 152, and 185 of defendants' Exhibit 321) are our advertisements. We advertise ourselves as manufacturers of the most complete line of counter and heel making machines, and we consider that to be true. Referring to a newspaper clipping to the effect that W. J. Young Company are issuing a pneumatic treeing machine to the shoe trade, we are preparing to build a pneumatic treeing machine of German design. Nearly a year ago we imported two of them and we intend to build others like them. We make a rand trimming machine. That is a different thing from a rand splitting machine, which you have in your list.

Mr. CHOATE. I would like to ask the court for permission to change that name in our list and call it a rand-trimming machine instead of a rand-splitting machine, if I may do so.

1169 FEBRUARY 5, 1914.

JOHN F. DONNELLY, witness for the United States.

My name is John F. Donnelly. I live in Brockton. My company is the Donnelly Machine Company, which designs, manufactures, and rebuilds shoe machinery. I have been engaged in that business for fourteen years. We make a buffing machine which is used for scouring the bottoms of shoes before finishing. We have put out eighteen or twenty a year. They are sold to shoe manufacturers. We also make a beading machine which is used for beading around the heel seat of a shoe. We have

not put out more than eight or ten of them in a year. They go principally to cobblers. We make a machine that can be used for a breasting or brush or heel brush scouring or heel-finishing machine, and have put out perhaps fifteen or twenty a year to shoe manufacturers and repair men. The finishing shaft is the same machine we spoke of. We formerly made a handwheel welt indenter, but we have not sold one for six or seven years. We also formerly made a power tip-punching machine, but we have not made any for the last four or five years. I make a rotary edge setter, of which we have sold only two. We have just finished the wood patterns for it. I rebuild Carver heel-scouring machines, and probably buy and sell ten or twelve in a year. We also make and put out about the same number of the old Amazeen skiving machines. They go to shoe manufacturers, repair, and custom men.

We make an edge-trimming machine, 15 or 20 a year, which goes to shoe manufacturers, repair men, and cobblers. Our heel breast scouring machine and our heel breasting machine are two different machines. The heel breasting machine is a machine for cutting down the heels with a knife; the heel
1170 breast scouring machine scours the heel breast after it is cut. We do not make McKay sewing machines, although I have bought and sold perhaps five of them second hand since I have been in business.

We make for the Plymouth Rubber Company a rib tightening or hardening machine for stretching cloth on inner soles. It is called the rib machine.

I have heard of the concern of Gardner & Beardsell. I do not know anything about them. I have also heard of the Lacene Manufacturing Company, but I do not know what their business consists of. I have never heard of the Universal Supply Company.

Cross-examination:

All of the machines which I have been asked about except the tip-punching machine and the Amazeen skiver operate on the bottom of the heel of the shoe. My letter dated May 19, 1913, to the United Shoe Machinery Company and my advertisement appearing on page 60 of defendants' Exhibit 321 were correct with the exception that the statement that we manufacture the Carver heel scourer was a mistake.

1171 FEBRUARY 5, 1914.

CHARLES A. HAMEL, witness for the United States, (recalled).

My name is Charles A. Hamel. I reside in Haverhill. My Company, the Hamel Shoe Machinery Company, is the successor

of the C. A. Hamel Company. I bought out the Duplessis Shoe Machinery Company, and afterwards organized the C. A. Hamel Company, which has now become the Hamel Shoe Machinery Company. I became connected with the Duplessis Shoe Machinery Company in the United States in 1903. I was associated with it in Canada about 1898. I don't know when that company first began business. I was not with them when they first started.

Of the catalogue in defendants' Exhibit 321, following page 159, the first one, with a red cover, was probably issued in 1902, when H. H. Duchesne was manager. The second catalog, with the gray cover, saying on the outside "Duplessis outsole stitcher," was issued in 1905 or 1906. Of the machines stated in defendants' Exhibit 321, to be manufactured by the Hamel Shoe Machinery Company at Lynn and at Haverhill, we manufacture at Haverhill welt beating machines, grooving and beveling machines, welt and turn sewing machines, out-sole lockstitch machines, molding machines, turn-sole molders, loose-nailing machines, slugging machines, leveling machines, and tacking machines. I do not know whether the other machines mentioned in defendants' Exhibit 321 are made at Lynn or not. The machines built in Lynn I can't tell—I can't specify. I am not familiar with some of those.

Cross-examination:

We have recently fitted up a factory at Newburyport, under the name of Williamson & Porrell. We sold the machines 1172 there. We have recently taken over the business of the Beaudry Machine Company, of Lynn. It made an edge setter. We also have taken over the business of the Hart Machine Company, which made stitching-room machinery, and that of T. C. Rowen, who made buffers and edge setters and machines in that line. I do not know that we have taken over the business of the Briggs-Belmer Company, of Haverhill, or of any manufacturers of edge-trimming machines, cutters, and shields. Mr. John Sullivan is associated with my company as treasurer and stockholder. He came into the company about a year ago. I do not know that the Singer Sewing Machine Company through Mr. Sullivan is furnishing money to my company. All I know is that Mr. Sullivan, of that company, has become the treasurer of our company. I am vice-president of the company, and I manufacture down at Haverhill. T. C. Rowen is the president. We employ from sixty to sixty-five men at both our shops.

1173 FEBRUARY 5, 1914.

THOMAS C. ROWEN, witness for the United States.

My name is Thomas C. Rowen. I live at Swampscott. I am president of the Hamel Shoe Machinery Company of Lynn and Haverhill, Massachusetts. Of the list of machines mentioned and described in defendants' Exhibit 321 as having been made by the Hamel Shoe Machinery Company, we manufacture at Lynn the following machines, the beading machine, buffing machine, breasting machine, channeling machine, Hart power hammer, perforating machine No. 6 Hart, perforating machine model A Hart, perforating punch feed machine, scouring machine, scouring machine for tips, snipping machine Hart, and trimming machine for edges. We manufacture at Lynn all the machines that have not already been checked on the list of machines in defendants' Exhibit 321. The list had previously been checked by Charles A. Hamel, the preceding witness, to show the machines made by the Hamel Shoe Machinery Company, at Haverhill. We employ at Lynn thirty-five or forty men. Our principal business is with shoe manufacturers. We do not do any business with shoe repair men.

(At this point, it was stated by Mr. Gregg, in answer to Mr. Choate, that either Mr. Hamel or Mr. Rowen had testified to manufacturing each of the machines on the defendants' Exhibit 321 list of machines manufactured by the Hamel Shoe Machinery Company and that the entire list is confirmed by those two witnesses.

(No cross-examination.)

1174 FEBRUARY 5, 1914.

JOSEPH A. PINE, witness for the United States.

My name is Joseph A. Pine. I live at Marlboro, Mass. I am now an overseer in the shoe factory of Widder Brothers, of Portsmouth, New Hampshire. As to whether I am engaged in manufacturing machinery, I have manufactured a couple of machines; yes. I have manufactured a Naumkeag buffing machine, of which I put out a round thirty-five. They were all sold to shoe manufacturers. I still manufacture a few. They are made for me by Tower Brothers, of Hudson. The machine is used to buff the shanks of the shoe.

Cross-examination:

On May 23rd I wrote to the United Shoe Machinery Company that I could supply a Pine buffing machine, making prompt delivery, for a price of sixty-five dollars. The cut which appears on the reverse side of page 103 of defendants' Exhibit 321 is a cut of my machine. It operates on the bottoms of shoes, in finishing them after the sewing operation.

1175 FEBRUARY 5, 1914.

GEORGE T. LYONS, witness for the United States.

My name is George T. Lyons. I have been for two years manager of the Boston branch of the Elliott Machine Company. Our company puts out a button-attaching machine for attaching buttons to the uppers. It does not put out the Heaton Peninsular button-attaching machine, or the Universal button-attaching machine. The Heaton Peninsular and the Elliott are different concerns.

Cross-examination:

The advertisement which you show me from defendants' Exhibit 321 is our advertisement. The machine shown on the reverse of page 153 of that exhibit may have been in our factory in Grand Rapids. We have stations pretty much all over the United States for these machines. As to whether our company has anything to do with the Heaton Peninsular button fastener, well, they have something, but I don't just know what it is. The main office of the Heaton and the Elliott is in Grand Rapids, but it has all come in since I left Grand Rapids. As to whether they now handle those machines I couldn't say, one way or the other.

1176 FEBRUARY 5, 1914.

J. JOSHUA LEMAY, witness for the United States.

My name is J. Joshua Lemay. I am foreman of the lasting department of Rice and Hutchins. I have worked with lasting machines at that factory and at the factory of Boyd & Corey. Boyd & Corey had Chase machines only. I started with them in 1881—not on the machine at that time, but later on the Chase. They made men's, boys', and youths' McKays and welts. The Chase machine was used on both McKay and welt work. I went with Rice & Hutchins in 1897. They now make Goodyear welt shoes. At that time they were making McKay shoes only. They were then using the Chase and the Consolidated machines. The Chase machine was successful on McKay work, and subsequently was used on welt work. They also made women's McKay shoes, which they lasted on the Consolidated machine. That was after I started to work there, in 1897 or 1898. I know of no reason why the Chase machine could not be used successfully in lasting women's shoes. I have used it on boys' shoes in sizes from one to five. They were both McKay and welt shoes.

(No cross-examination.)

1177 FEBRUARY 5, 1914.

WALTER C. SPRINGER, witness for the United States.

My name is Walter C. Springer. I am assistant superintendent of one of the factories of Rice & Hutchins, Incorporated.

I have had partial charge at times of the lasting room, giving out work, supervisory duties only. At the present time we are making welt shoes on the Number Five and Consolidated lasting machines. Before the Number Five came out we had the McKay and Copeland machines and the Chase machine. The former was used on the heavier, coarser grades of men's shoes.

Q. On what kinds of shoes did you use the Chase machines?

A. McKays and welts—men's, boys' and youths'.

Q. Did you use it at all on women's shoes?

A. Yes, sir.

Q. Now, state whether or not that Chase machine can be used and was used in the lasting of women's shoes as well as men's shoes, and all grades of shoes.

A. Yes, sir; it was used on all the grades you mention.

Q. Was it used successfully?

A. Yes, sir.

Q. Do you know of any reason why it cannot be used on women's welt shoes the same as on men's?

A. No, sir.

Cross-examination:

I am not a machinery man, nor an expert on lasting machines, but I have had the responsibility of deciding what kinds of lasting machines to use. I have been assistant superintendent of what is called the Curtis Factory since it was built, twelve years ago, and before that I was assistant superintendent of the Cotting Avenue factory. Mr. Charles Curtis is at the head of the business, and most things go as he says in Rice & Hutchins' Marlboro factory, but he gives me very little instruction. 1178 The Chase machines were in the factory when I went there. I tried to do the work that came in with the machines which we had. We have made nothing but welt shoes in the Curtis factory, men's, almost wholly. None of them are now lasted on the Chase machine. We use the Number Five and the so-called "nigger-head" or Consolidated welt laster. Before the Number Five we used the Chase and the "nigger." We have never made women's shoes in the Curtis factory, but we did make them in the Cotting Avenue factory. I can not say how long I was employed in the Cotting Avenue factory, but I have been employed by Rice & Hutchins for nearly twenty years. The Curtis factory, so-called, is the Cotting Avenue factory continued. I went into the Cotting Avenue factory in 1893, and we moved out of it somewhere around 1902. In that factory mostly men's McKay shoes were made, and women's shoes were made only for a limited time. At first the bulk of the lasting was done by hand, with the Chase machine as an auxiliary, and

afterwards we installed the McKay and Copeland and the Consolidated McKay lasting machine, which is different from the Consolidated welt lasting machines. Most of our shoes were lasted with the Consolidated machine, but ten or a dozen Chase machines were kept in constant use. Making women's shoes was to some extent experimental with us, and was confined to a year.

Q. Why was it given up?

A. Why, we had some complaints and the people overreached themselves and were very much disappointed when we discontinued. I think they were looking for more value than we were willing to give.

Q. You mean they complained of the shoes?

A. Yes.

Q. What about that?

A. They said they were not selling. When Mr. Rice, of Rice & Hutchins, looked into the matter he couldn't find that they had any on hand. They cleaned them up—deceived them.

Q. At any rate you only did it for a year and then stopped?

A. Yes.

Q. How many of them did you make?

A. A matter of a few thousand pairs.

Our factory was set up in all respects to make men's McKays. We took on this small line of women's shoes as an experiment and used the same machines we had. I am not undertaking to give any very well-studied opinion as to the various uses that the Chase machines may be commercially put to successfully.

I am here to answer your questions.

1179 Direct examination resumed:

I never heard that there was anything wrong with the lasting of those women's shoes.

Cross-examination resumed:

Those women's shoes were McKays and were lasted on the Chase machines.

1180 FEBRUARY 5, 1914.

WILLARD G. BRACKETT, witness for the United States.

My name is Willard G. Brackett. I am connected with Joseph Breck & Sons' Corporation, who sell gardening machinery and seeds. I formerly owned six hundred shares of stock of the Eppler Welt Machine Company, which I sold on February 15, 1899. I do not remember to whom I sold them. I got six dollars and fifty cents a share for it. The capital stock was sixty thousand shares at ten dollars a share, six hundred thousand dollars in all.

(No cross-examination.)

1181 FEBRUARY 6, 1914.

LOUIS K. MCNALLY, witness for the United States.

I am a clerk in the office of the secretary of the Commonwealth. I have produced the original report of the United Shoe Machinery Company to the commissioner of corporations of the Commonwealth of Massachusetts in the year 1913, and certified copies of similar reports of that corporation for the years 1910, 1911, and 1912.

(These certified copies were introduced in evidence as plaintiff's Exhibits 276, 277, and 278, respectively.)

(No cross-examination.)

1182 FEBRUARY 6, 1914.

SIDNEY W. WINSLOW, witness for the United States.

Q. Mr. Winslow, you furnished at the request of the United States a list of shoe manufacturers holding machines of the lasting, heeling, or metallic departments of the United Shoe Machinery Company on January 1st, 1905, on independent unrestricted leases, giving therein the total number of lessees on such leases as 706. At random I will pick out the firm of Boyd & Corey, boot and shoe manufacturers. Have you any idea, Mr. Winslow, what particular machine is covered by that lease?

A. No, I have not.

Q. Do you have any idea what kind of machines is covered by these unrestricted leases of any of these manufacturers?

A. Well, I haven't at the present time. It might be, of course, in any one of the different departments. Take, for illustration, the McElwain Company. I had prepared a memoranda of the lasting machines which it took from our company from the date, I think, of the formation of the company, up to 1911, on independent unrestricted leases.

Q. Now, where any kind of a machine, regardless of the importance or character, is held by a lessee under any of those forms of lease which you call unrestricted, that company holding such a lease has been placed on this list; that is true, isn't it?

A. I don't understand what you mean by unimportant machines.

Q. Well, Mr. Winslow, we will leave the word "unimportant" out and say, doesn't it include unrestricted leases on every character of machine that is held under lease?

A. In those departments.

Q. In the departments that are mentioned here?

A. Yes, sir.

Q. Some of the leases may cover one machine and some of them may cover a number of machines?

A. I understood that to be your question. I understood that to be what you asked for.

Q. And this includes lessees who are engaged in the repair business, as well as those who are engaged in manufacture?

A. No, sir; entirely confined to shoe manufacturers. I think it is so stated on the list.

(No cross-examination.)

1183 FEBRUARY 6, 1914.

FRANK ALBERT BRACKETT, witness for the United States.

My name is Frank Albert Brackett. I am now employed by W. H. McElwain. I formerly worked in the shoe factory of the Boylston Manufacturing Company, at Fairhaven. They made men's shoes. That was in 1908 and 1909, if I remember correctly. I was familiar in a general way with the machines that were being operated in that factory. They had two welting machines which were manufactured by the Boylston Manufacturing Company. The company did not put any of them out but was just operating them in its own factory. One of the welt machines, but not the other machine, had a stop motion attachment, and it had a little finger where the welt went through so that it wouldn't pull back; that was called a welt holder, and it was a very simple arrangement. They were on the machines in 1909. I do not know when they were developed. I had nothing to do with that development. That was done in Boston. I am superintendent of the factory.

Cross-examination:

That was Mr. Henry H. Rogers's factory. During the last year it was equipped to make men's welt shoes. We had no machines obtained from the United Company. We got them all elsewhere, and we made welt shoes without any machines from the United Company. The most we ever made was twelve hundred pairs a day.

1184 FEBRUARY 6, 1914.

CHARLES H. JONES, witness for the United States, recalled.

My name is Charles H. Jones. I am president of the Commonwealth Shoe and Leather Company.

Mr. GREGG. Now, if the court please, last spring when I had Mr. Jones on the stand I had him produce a list of the machines that he had in his several factories at Whitman, Gardiner, and Skowhegan, and the list that he produced related only to the bottoming machinery and the eyeletting and clicking machines. Mr. Choate asked that the list be made complete and include all the machines in his factory, and for that reason, to accommodate him, I withdrew that exhibit, and I now have the second list.

I have prepared a list of all the machines that I have in my factory, including not only bottoming room but also upper stitching room machines. It shows under the column headed "U. S. M." the machines obtained from the United Shoe Machinery Company and under the column marked "Outside" those obtained from other manufacturers.

Mr. GREGG. Now, I would like to have that exhibit marked as a Government exhibit. However, I wish to make the statement that in connection with this list that is now produced the Government does not rely upon any part of it except machines used for adjusting and attaching the upper to the last, and machines for preparing and attaching the bottoms to the uppers, and machines for finishing the bottoms, and clicking machines and eyeletting machines.

(This list of machines in use in all the factories of the Commonwealth Shoe and Leather Company is marked "Plaintiff's Exhibit 279.")

(No cross-examination.)

1185 FEBRUARY 6, 1914.

WILLIAM B. ARNOLD, witness for the United States.

My name is William B. Arnold. I formerly owned one hundred shares of the stock of the Eppler Welt Machine Company. I sold it about the time of the organization of the United Company, receiving six hundred dollars for my hundred shares. My impression is that I sold it to Mr. George W. Brown, vice president of the United Company.

Cross-examination:

I can not fix very accurately the date when I sold my stock. I can't tell within a year as to when it was. I am quite sure that I sold it either to Mr. Brown or to Mr. E. P. Hurd. But I would not be positive.

1186 FEBRUARY 6, 1914.

WILLIAM G. JOPSON, witness for the United States.

My name is William G. Jopson. I live in Abington. I am general manager of the American Worsted Machinery Company. The company does not now manufacture any McKay channeling machines. I have been with the company only since January 1st of this year. Prior to that time Mr. Bicknell Hall had the position that I now occupy. I only have knowledge of the business since the first of this year.

(Replying to a question by Mr. Choate, Mr. Gregg stated that he did not claim that this witness's testimony is of any consequence with reference to the defendants' representation about the American Worsted Company.)

(No cross-examination.)

1187 FEBRUARY 6, 1914.

BICKNELL HALL, witness for the United States.

My name is Bicknell Hall. I live in Abington. I was formerly connected with the American Worsted Machinery Company as president and agent. I was with that company from 1907 until last January. During the period that I was connected with the American Worsted Machinery Company we manufactured the McKay channeling machine. We put out twenty-five or thirty altogether. They went to shoe manufacturers. We put out also four types of eyeletting machines—model A, model B, Monitor, and Eureka. During that period we put out between one hundred and twenty-five and one hundred and fifty eyeletting machines. They were sold a good deal through dealers, who were practically our agents. We did not make or handle a finishing shaft, a straight-edge folding machine, a hooking machine, or a channel-laying machine. We made a pinking machine, but we did not make a perforating machine unless it is the same machine. These machines are used on the tips of shoes. We did not make or handle a rounding or a channel opening or a feather-edge and shank-reducing machine. We did not make a McKay sewing machine, but we handled and made parts for that machine. We did not make or handle a lip-turning machine or a rand-turning machine.

Cross-examination:

The American Worsted Machinery Company began business when I went with them in the fall of 1907 or in January, 1908. They continued to run their shop in Abington until recently, when they sold out to certain English capitalists. I think it was last October. I understand that they are now preparing

1188 to manufacture English textile machinery in this country.

I wrote the letter dated May 19, 1913, on page 1 of defendants' Exhibit 321. We had a machine shop and machine tools and were prepared to manufacture any machinery desired in the shoe line—any kind of shoe machinery that any one ordered. We had facilities for making all of the machines named in that letter and we were ready to make them for anybody; we quoted prices in that letter on a Severance tap rounder, $12; straight-edge folder, $15; bottom polishing shaft, $8 (that is the same as a finishing shaft); channel layer, $18; Little Giant hammer, $15; feather reducer, $25 (that is the same thing as a feather-edge reducing machine); perforator, $65 (that is the same as a perforating machine); rand turner, $18; lip turner, $35; Fischer channel opener, $35; McKay sewer, $250. A McKay sewer is a

McKay sewing machine, and we were ready to make that for anybody. Our catalogue shows that we were ready to furnish to customers the following machines: McKay channeler, Fischer channel flap turner, power punch and eyelet machine, power eyelet machine, B eyelet machine, O. K. self-feeding eyelet machine, Eureka self-feeding eyelet machine, Monitor self-feeding eyelet machine, foot hook set machine, foot punch, Tripp improved skiver, new old-style skiver, pinking machines, pinking-roll turner, Amazeen knife.

We wrote to the United Company on May 17th, page 2 of defendants' Exhibit 321, quoting prices on certain machines which are named in our letter. The machines and the prices quoted are a McKay channeler, $18.00; "A" machine (that is an eyeletting machine), $40.00; raceways, $14.00; "B" machine, $22.00; raceways, $10.00; O. K. machine, $18.00; raceway, $9.00; Eureka machine, $12.00; raceways, $5.50; Monitor machine, $16.00; foot hook set machine, $4.00; foot punch, $2.25; calendar punch, $9.00; Tripp improved skiver, $18.00; new old-style Tripp skiver, $8.50; geared pinking machine, $7.50; hand pinking machine, $4.00; pinking roll turner, $4.50. We were ready to furnish those machines to anyone who ordered them.

1189 Direct examination resumed:

We had all the machines, mentioned in the last letter, ready to put out—ready to supply to anybody.

1190 FEBRUARY 6, 1914.

JOHN F. CAVANAUGH, witness for the United States.

My name is John F. Cavanaugh. I live at Ashland, Mass. I am a salesman of shoe machinery connected with the Boylston Manufacturing Company. I have been with that company since 1898, and in my capacity of salesman have traveled over this country, visiting shoe factories, and have been abroad. I have heard of the Atlas-Werke Pohler Company, of Leipzig, Germany. They are in the shoe-machinery business. To the best of my knowledge, they are not engaged in business in this country. I have heard of Adrian & Busch, of Frankfurt, Germany. They are in the shoe-machinery business, but they do no business in this country, so far as I know. Dilley & Sons, of Northampton, England, are to my knowledge engaged mostly in supplying shoe findings. I don't know whether they do any business in this country. Gimson & Company (Ltd.), of Leicester, England, are in the shoe-machinery business. They are preparing to put machines out in this country. Heaton's (Ltd.), of Leicester England, make a slugging machine. They do not do business in

this country to my knowledge. A. H. Johnson, of Leicester, England, is the same concern as A. Johnson, who is in Paris, France. He is engaged in the shoe-machinery business, but does not do any business in the United States. I never have heard of Keats & Boxon (Ltd.), of Stafford, England. I have heard of the Keats Machinery Company, of Frankfurt, Germany, but I do not know much about them. I have never heard of the Job Lee Premier Works, of Kettering, England, or of Lintz & Eckhardt, of Berlin, Germany. Livingston & Doughty, of
1191 Leicester, England, are mostly a supply house. They do no business in this country so far as I know. I never heard of Stephen Lucking, of Chester, England. I have heard of Mills & Company, of Kettering, England. They had supplies and a kind of lasting machine; I don't know whether they do business in this country. Mobbs & Lewis (Ltd.), of Kettering, England, have a treeing machine. They do no business in this country. The Moenus Machine Works, of Frankfurt, Germany, have a complete line of shoe machinery, as do Nolle's Works, also in Germany. Neither of them do any business in this country, as far as I know. The Northampton Machinery Company (Ltd.), of Northampton, England, was a branch connected with the Standard Rotary Company. It is engaged in the shoe-machinery business. I believe they do no business in this country. I have never heard of A. T. Ralphs, of Norwich, England. The Standard Engineering Company, of Leicester, England, have a lasting machine, and buy and rebuild other machines. They are quite successful in the machinery line. They do no business in this country. The Standard Rotary Machine Company, of Rushden, England, have a complete line of machines. They do not do any business in this country. I do not know Summers & Sons, of Wellinborough, England. To my knowledge John Thacker, of Leicester, England, handles supplies and findings. So far as I know, he does not do business in this country. Timson, Bullock & Barber, of Kettering, England, sell shoe machinery; I believe they do no business in this country. I do not know the Universal Shoe Machinery Company (Ltd.), of Northampton, England, nor the Velocity Machine Company, of London. Ward & Gent, of Northampton, England, do a good business in shoe machinery, stitchers, but are doing no business in this country. I do not know Whitehead & Company, of Dunkinfield, England.

1192 The Boylston Manufacturing Company took over the Tripp Leveler Company in 1904. We disposed of the machines which the Tripp Company had on hand and sometimes rebuilt a machine, but we have never manufactured any.

The Union cementing machine was formerly manufactured by the Flagg Manufacturing Company. It is obsolete, and we have never manufactured any. The Boylston Company took over the Flagg Company in 1904.

Cross-examination:

My work for the Boylston Company keeps me traveling all over the country, offering and attempting to place the machines. We have a lasting machine, but can not sell it.

Q. You recently put one in in the S. H. Howe factory at Marlboro?

A. That is recently, within a month or two.

Q. Well, don't be ashamed of it.

A. I am not ashamed of it.

Q. Don't be discouraged about it. You have recently put one or two pulling-over machines there, too, haven't you?

A. At the same time.

Mr. CHOATE. Well, cheer up.

The WITNESS. I am. I feel all right.

Q. You have recently put a slugging machine there, too, haven't you?

A. Yes, sir.

1193 Q. You have sold quite a number of heel-blacking machines, haven't you?

A. I have.

Q. Copeland heel-finishing machines—haven't you?

A. Yes.

Q. You have put sixteen of those Copeland heel-finishing machines down in Auburn and in Binghampton?

A. In Auburn.

Q. Auburn and Binghampton. Auburn, Maine, and Binghampton, New York?

A. Yes.

Q. You put four of those Boylston machines in Florsheim's factory, haven't you?

A. Yes.

Q. And you put thirteen of them in the Selby Shoe Company, Portsmouth, Ohio?

A. Yes; put thirteen there.

Q. And you put five of them with F. M. Hoyt Shoe Company, Manchester, New Hampshire?

A. That is right.

Q. You have also put your heel-blacking machine with Cushman, Hollis & Company, Auburn, Maine?

A. Yes, sir.

1194 Q. You have been spending a good deal of time lately in getting witnesses for the United States; that might have interfered with your shoe machinery selling?

A. I don't think so.

Q. Haven't you been quite busy lately getting witnesses for them?

A. I wouldn't consider so.

Q. I don't know what you consider quite busy, but you have been out working on it, haven't you?

PUTNAM, J. You don't question the facts he states, do you?

Mr. CHOATE. I think his testimony is very much tinged with bias.

PUTNAM, J. All right.

Q. You have been busy getting witnesses for the United States lately?

A. I can't say as I have been busy.

Q. Have you been at work on it?

A. At work on it?

Q. Yes.

A. That would depend on what you consider work.

Q. Have you been around seeing people that have been here as witnesses?

A. I might have seen some.

Q. And have you been in consultation with the attorneys for the United States about witnesses for them?

A. About witnesses?

Q. Yes.

A. I couldn't say I have been in consultation about witnesses.

Q. About the trial of their case?

A. I don't know as I can just interpret how you mean that.

The Standard Rotary Machine Company, Gimson & Co., Johnson, of Paris, the Moenus works, the Nolle works, and the Atlas works are all good sized concerns. The Standard Rotary Machine Company and Johnson manufacture complete lines of shoe machinery. When I said that as far as I know they were not doing business in the United States, I mean that I have not seen them doing business in my travels. The Standard Engineering Company is ready to do business in the United States if the opportunity appears, and I should say that the other companies would do so, although I do not know that they would.

1195 FEBRUARY 6, 1914.

HARRIE A. BALLARD, witness for the United States.

In 1894, I was employed by the Copeland Boot & Shoe Treeing Company, at South Framingham, Mass. While I was working there I devised a welt support or holder which held the welt

against the shoe while the needle was going out of the welt and which obviated the necessity of holding the welt with the fingers while the needle was being removed from it. That was used at Fairhaven in 1907 and 1908. We also had on our welt machines at South Framingham a stop-motion which afterwards was used in Fairhaven. The device was not used anywhere else.

The welter which we had at South Framingham was also equipped with a welt-cutting and a thread-cutting attachment which I invented. These devices were afterwards used at Fairhaven in 1907. A certain Mr. Emery came to South Framingham and made an examination of our machinery in 1905.

Cross-examination:

I was at South Framingham when Mr. Emery came there in 1904, acting as superintendent of the machine shop. I was then connected with the Copeland Boot & Shoe Treeing Company, who made shoe-treeing machinery. Mr. Emery was introduced to me by Mr. Copeland, and I went through the different rooms of the shop with him. We employed at that time about thirty men. Mr. Emery spent about an hour in the factory, and walked through its different rooms.

Q. Were any machines in operation?

A. You mean treeing machines? Our treeing machines was all in operation; yes, sir.

Q. They were all in operation?

A. Yes, sir.

Q. Was there any welt machine there that was in operation?

A. Yes, sir; that is, we had a shoe and we run it through the machines.

Q. And was there any stitching machine there?

A. Yes, sir.

Q. Whose stitching machine was it?

A. My machine.

Q. You mean a Copeland?

A. A Copeland machine; yes, sir.

Q. Had you gotten out a stitching machine?

A. One I was making; yes, sir.

Q. And did you get out a welter, also?

A. Yes, sir.

Those were the machines which were used at Fairhaven. They never have been put on the market elsewhere.

1196 FEBRUARY 6, 1914.

WILLIAM F. DONOVAN, witness for the United States.

My name is William F. Donovan. I am president of the Atlas Tack Company, and take an active part in the manage-

ment of the company. I have some general trade knowledge of the eyelet business in the United States. We sell eyelets. The Rimmon Company, the S. O. & C. Company, the Rhodes, the Hughes, and the Atlas Tack Company, and the Fast Color Eyelet Company, are, so far as I know, the only companies selling shoe eyelets to shoe manufacturers in the United States. Our output during the last year has been from forty to sixty million eyelets per month. Three or four years ago, before my advent into the business, it was nearly twice as high. Practically all of the eyelets we make go into the shoe trade. I do not know of the Caseley-Nelmes Company. The Scovill Manufacturing Company make eyelets for general purposes. It is possible that they make shoe eyelets, but I never heard of it. The R. N. Bassett Company make corset eyelets, I think. The Waterbury Brass Company and the Waterbury Manufacturing Company, are not, so far as I know, in the shoe eyelet business. I do not know anything about the American Ring Company, or, in connection with shoe eyelets, about the Rome Brass Works. In making shoe eyelets we come in competion with no concerns except the five I have mentioned, that I can recall.

Cross-examination:

I have been with the Atlas Company for three years. I was not in the eyelet business before that. My knowledge is confined entirely to my experience during those three years. We have recently begun to make corset eyelets. I think
1197 most eyelet makers make eyelets for different kinds of businesses, and their eyelets are used for a great many other things besides shoes. Very possibly some of the other five concerns of which I spoke that make shoe eyelets also make other kinds of eyelets and possibly some of those other concerns make shoe eyelets. Eyelets are used for a great variety of purposes. The market for shoe eyelets has been cut down within the last few years, on account of the great increase in the number of button shoes that are being manufactured and used. We attribute our decreased production to that.

1198 FEBRUARY 6, 1914.

RICHARD H. LONG, witness for the United States, recalled.

My name is Richard H. Long. I testified last spring in this case. I have never tried to sell the R. H. Long Machinery Company to the United Company or offered it to them.

Cross-examination:

I know Mr. Maurice Bresnahan. At one time he asked me if I would sell my shoe machinery business to the United Com-

pany. That was in 1911 or 1912, after Mr. Plant had sold out. We talked about it three or four times in Boston; he invited me to lunch at the Essex once, and once at a restaurant near the market, and on one occasion he invited me to come down to Beverly, and I went down there, but nothing was said about selling out at Beverly. I don't remember where the third place was that we talked about selling. I did not solicit Mr. Bresnahan to sell my business to the United Company. I told him I was not interested at all, to sell the business, and did not intend to sell it out. I know Junius Beebe who is engaged in the leather business. He is a friend of mine. I have known him a long time and buy leather of him. I have talked with him about selling out my business to the United Company.

Direct examination resumed:

The substance of my conversation with Mr. Beebe was that he thought it would be a good thing for me to dispose of my machinery business. The conversation took place two or three years ago. I never intended to sell.

1199 Cross-examination resumed:

I never suggested to Mr. Beebe that he see the United Company to find out what he could do for me. Not to my knowledge did he ever say anything to the United Company, and he didn't tell me that he had talked with them.

(At this point counsel for the United States read into the record certain advertisements of the Consolidated & McKay Lasting Machine Company in the Hide and Leather Reporter of December 3, 17, and 31, 1898, advertising the Consolidated hand-method lasting machine for lasting welt shoes. Counsel also read an advertisement of the Chase Lasting Machine Company under date of December 22, 1907, advertising that machine for the purpose of lasting women's shoes. Counsel also read an advertisement of the Eppler Welt Machine Company published in the Boot & Shoe Reporter, issued on November 9, 1898, stating that the royalty rates for the Eppler machines when used on men's shoes was three cents per pair. At this point the Government rested.)

1200 Additional evidence for the defendants before the court February 10, 1914.

Appearances.

For the United States: James A. Fowler, assistant to the Attorney General; William S. Gregg, special assistant to the Attorney General; Allen Webster, special assistant to the Attorney General.

(After the decision in the District Court): Constantine J. Smyth, H. LaRue Brown, special assistants to the Attorney General.

For the defendants: Frederick P. Fish; Charles F. Choate, Jr., William A. Sargent, Malcolm Donald, Harold G. Donham, Walter B. Farr, Lafayette R. Chamberlain.

FEBRUARY 10, 1914.

EDWARD P. HURD, witness for defendants.

1201 I live in Newton and I know William B. Arnold, of Abington.

Q. Mr. Arnold testified that he thought some time in 1899 he sold you one hundred shares of the Eppler Welt Machine Company. Did you ever buy of Mr. Arnold any shares of the Eppler Welt Machine Company for yourself, or anybody else?

A. No, sir; to the best of my recollection, nor any other Eppler shares from anyone else.

Mr. CHOATE. That is all.

Mr. GREGG. No cross-examination.

FEBRUARY 10, 1914.

GEORGE W. BROWN, witness for defendants.

I live in Newton. I know William B. Arnold, of Abington.

Q. Mr. William B. Arnold testified that he thought he sold either to you or to Mr. Hurd some shares of the Eppler Welt Machine Company in 1899. What do you say, Mr. Brown? Did you ever buy any shares of him?

A. No, sir.

Q. Either for yourself or for the United Shoe Machinery Company or anybody else?

A. No, sir.

FEBRUARY 10, 1914.

FREDERICK L. EMERY, witness for defendants.

I live in Lexington and am a member of the bar and of the bar of this court. I have been practising twenty odd years.

In 1910 and for quite a number of years prior to that year I was one of the patent counsel and patent solicitors for Mr. Thomas G. Plant.

Q. Harrie A. Ballard, of the Copeland Machinery Company, says that in 1904 or thereabouts, you visited the Copeland Company's machine works in South Framingham, and that you were there shown a welter and a stitcher on which there was a stop-motion device like that which Mr. Plant subsequently developed, and a welt-holding and cutting device like that which Mr. Plant subsequently developed. What do you say about that?

A. I have no recollection whatever of being shown either of those devices.

Q. Were you familiar with the development of those devices by Mr. Plant?

A. Yes, sir.

Q. You were with him all the time that that was being done?

A. A large part of the time.

Q. It has been suggested by one of the attorneys for the United States that Mr. Plant obtained his ideas with respect to those devices from Mr. Ballard or Mr. Ballard's devices or inventions. What do you say about it?

A. It is absolutely not so.

1202 Q. Had Mr. Plant any connection with Mr. Ballard, or, to your knowledge, did he or anybody employed by him know anything about any work that Mr. Ballard had done in that direction?

A. So far as I know, none whatever.

Q. And you were familiar with the development of those devices from the beginning?

A. Very familiar—worked with him all the time on it.

Cross-examination:

As to whether I went through the Boylston factory, I was shown through a shop. Whether it was the entire shop, I do not know. That was located in South Framingham. My purpose in going through the shop was to see what machinery Mr. Copeland had at that time, constructed or in process of construction. I went through at the invitation of Mr. Copeland.

I did not have any conversation with Mr. Plant relative to that particular visit. He merely knew that I was to go there.

As to what machines I saw in the Copeland factory, my recollection is that I was shown the automatic treeing machine and a hand treeing machine and a wire tacker.

Q. Did you see a welt-sewing machine there?

A. I have no recollection of seeing such.

Q. You won't say whether you did or not?

A. I feel very certain that I did not.

Q. Did you see an out-sole stitching machine there?

A. I did not.

Q. You are positive of that, are you?

A. So far as my recollection serves me, I saw neither of those machines.

As I have stated, my purpose in going through the Boylston factory was to see the line of machinery that Mr. Copeland had, so far as developed. At that time I was working on the Plant patents and machines.

Direct examination resumed:

It is my recollection that I went at Mr. Copeland's invitation.

He went with me.

1203 FEBRUARY 10, 1914.

MAURICE V. BRESNAHAN, witness for defendants.

I live in Lynn and know Richard H. Long, of Framingham.

I did not on any occasion have any conversation with Mr. Long with reference to the sale of his machinery business to the United Company. He did say something to me with reference to the sale of his machinery or shoe machinery business to the United Company.

There was a personal matter between Mr. Long and myself which had not been settled up before I went with the United Company. We lunched at the Hotel Essex and settled up that matter. After that the conversation naturally drifted to the United Company. He wanted to know how I liked being with the company, and I told him very well indeed, and I also told him about the improved machines that the company had, and he expressed a wish to go to the factory and take his man, Mr. Doidge, with him to see those machines.

I told him that I would arrange with Mr. Brown, our general manager, to allow him to go through the factory. I did this, and I took them through the factory. Mr. Long was surprised to see so many improvements and seemed rather pleased.

I took him all through every place there was there, and while we were discussing matters there he said to me: "I don't know but what I would be better off if I would give the whole of my time and attention to the manufacturing of shoes and let the shoe machinery alone. If I could get rid of what I have, I would be better off to do so. What do you think? Do you suppose I could get them to take it?" I said: "I don't know; I will speak to Mr. Brown about it and let you know." So I left him; he didn't stop to lunch at the factory; he and Mr. Doidge went home before lunch, and I remained at the factory. Three or four days after that I met Mr. Brown and told him the conversation. He wanted to know what Mr. Long had, and I told him simply copies of machines that had been discarded by the company and nothing, so far as I could see, that was an improvement or new. He said: "We wouldn't have any use for that; I don't see that there is any use in discussing the matter any further." So I telephoned Mr. Long and made another date with him, and we had lunch at the Essex again, and I informed him the conclusion the general manager had come to. That ended it, and I haven't seen Mr. Long since.

Q. He says you approached him and tried to buy his shoe machinery business; is that so?

A. It isn't so. I had no authority to do anything of the kind, and I haven't exceeded my authority yet.

1204 Cross-examination:

I did not ask Mr. Long if he would sell his machinery. I did not make any statement of that character to him. I saw him about my own personal matter at the Essex Hotel at Boston. Mr. Long's statement that he did not know but what he would be better off if he adhered strictly to shoe manufacturing was made at the United Company factory in Beverly, after he had seen the new machines. The matter of purchasing his machinery was not mentioned at our first meeting at the Essex Hotel. At that meeting he expressed a wish, when I told him of the machines that he knew nothing about, to see the machines, and to have his superintendent or general manager, Mr. Doidge, also see them. I arranged for them to do this, and we went down to Beverly.

At Beverly Mr. Long expressed a wish to have me discuss the matter of selling his business with Mr. Brown, and see if the United Company had a desire to take it over. Nothing was said about the price. Mr. Long never made any statement to me that he did not desire to sell his shoe machinery.

1205 FEBRUARY 10, 1914.

GEORGE E. KEITH, witness for defendants.

I have been called before by the United States, and I was also under summons by the United States all last week and was not called.

I am a shoe manufacturer in Brockton, and have been for a good many years.

I did not have an Ideal lasting machine in my factory before the organization of the United Company in February, 1899. I put in the first Ideal machines in my factory in November, 1899.

The occasion for my taking any Ideal machines at that time was that that was about the time of a radical change in the style of shoes; it was the era of what they call the bulldog toe. The bulldog toe originated in Brockton, and so far as I know there was no manufacturer in Brockton ahead of me in the introduction of the high-toed last.

The idea of getting the Ideal machine to try on the high-toed last was because it wiped up on the side of a last better than the Chase and then with the adjustable head helped us to overcome the height and width of the toe. That was the reason that led me to take and try the Ideal. I got them first in November, 1899.

When we first used the Ideal laster on men's shoes we couldn't get the result that we expected or wanted. The difficulty was that the machine being so light the last would lift as you came up on the sides of the toe, and the result was that you couldn't push over the—I don't know just the word you would apply—push over the vamp at the top of the last. It would rise, so that it was impossible to do the work.

A device was developed in my factory to be attached to the Ideal machine to help it in lasting men's shoes. This was an attachment that could be swung around to hold the last down in its place so that the work could be performed better and so that the last could not rise. Very soon after we began to use the Ideal machine my people got to work trying to find something like that. We were up against this difficulty, and we had to invent some way to overcome it. The superintendent or foreman of Lasting Department No. 3 was one of the first who conceived the idea, and then it was perfected afterwards, but I do not know by whom.

Until that was done, in my opinion, the Ideal machine would not be commercially a success, under the conditions that were on the market at that time. Before we put on the hold down the trouble was with bringing the upper smoothly on a last that had a wide edge—to bring that up smooth before it was wiped over. As it came up over the sides of the last the last would spring up. As a result, we could not complete the job.

1206 This required the operator to keep repeating the operation a number of times and that slowed him down, and it creased fine leather or patent leather so that the shoe would be almost ruined.

After this hold-down adjustment was put on we increased the number of Ideal machines. So far as I know, there was no other place in the country where the Ideal machine was used for lasting men's shoes except in Brockton, where the high-toed last originated.

Cross-examination:

I never operated a lasting machine myself, but I think I know something about the operation of lasting machines. Just from observation; yes, sir. I never had any Copeland rapid lasters.

Before we took up the high toes we used the Chase machine. We got the Ideal machine to last the high-toed shoes, because we thought it could perhaps do better work. I remember very well the difficulties we met in lasting them.

The Chase machine was all right when we had the ordinary lasts, but it had a head that was permanent—it could not be

adjusted. And you can see the point—when jumped from a low toe in a last to a very thick high toe that it didn't adjust itself so well as the Ideal machine. But the Ideal machine of itself was not strong enough to do the work after we put it in, and we soon saw that some improvement had got to be made on the machine.

We used the Ideal machine a very short time before we put on this improvement. I couldn't state any definite time.

Direct examination resumed:

The output of my factory is twenty thousand pair a day.

1207 FEBRUARY 10, 1914.

NELSON W. HOWARD, witness for Defendants (recalled).

Direct examination:

Prior to the organization of the United Company the Goodyear Company had put out 248 Ideal lasting machines. Nearly 200 of those machines were in factories where only women's shoes were made.

Q. Now, have you ascertained whether any of those were in factories where women's shoes were made exclusively?

A. Practically all women's welt shoes that were being lasted by machine in 1899—January 1st, 1899—were being lasted on the Ideal lasting machine. That machine practically had the women's welt shoe field to itself.

Mr. GREGG. I submit, if the Court please, that that answer is not responsive to the question at all.

Q. My particular question was whether you had been able to ascertain how many of those Ideal machines were located in factories where they did not——

PUTNAM, J. Was it an answer to that question?

Mr. CHOATE. Yes, sir.

PUTNAM, J. Well, of course it is not responsive, Mr Choate.

Mr. CHOATE. I will put another question. I want to get this one answered first.

At that time some 40 or 50 Ideal machines were in factories where both men's and women's shoes were made, and about 40 were located in factories where only men's shoes were made. The factories where Ideal machines were used in making men's shoes were chiefly in Brockton, which was the centre of that use. The high-toed last was introduced in 1899. The last of defendant's Exhibit 135 is the last which was supplied by the Boston Last Company from 1899 to 1901.

Mr. Keith's factory got its first Ideal machines in November, 1899. Keith had no Ideal machines prior to the organization of the United Company. There were 17 in the Douglas factory then, and Whitman & Keith had 7 Ideals.

In reference to the testimony of Mr. Heffernan, superintendent of the Whitman & Keith factory, that in his opinion the Ideal did better work on the whole than the No. 5 lasting machine, I have examined the records of royalty returns from the Whitman & Keith factory. I found that the largest day's work done on the Ideal machine in that factory since January 1, 1899, was 164 pairs in March, 1911. The largest day's work done on the No. 5 lasting machines, since the first one was installed in that factory, was 193 pairs in November, 1911. That is 29 pairs more than the highest number done on the Ideal, and represents approximately the increased capacity of 1208 the No. 5 machine over the Ideal. I also found that of the two Ideal lasting machines leased by Whitman & Keith in 1907, one has been entirely idle since April, 1911, and the other has been entirely idle since March, 1912, and after April, 1911, very few shoes were lasted on that machine. Of the other seven Ideal machines which Whitman & Keith had obtained before 1907, two have been idle for a considerable period—I can't state for how long, because those are non-royalty machines—so that the situation is that four Ideals are idle in Whitman & Keith's factory, of which two are nonroyalty machines, while the three No. 5 lasting machines, which were shipped, respectively, in September, 1907, and January and February, 1911, have been in constant use ever since they were installed.

The royalty which Whitman & Keith pay on the No. 5 machine is five-eighths of a cent a pair and they pay one-half a cent a pair on the Ideal machines, so that they are using to their full capacity all three of the No. 5 machines on which they pay a higher royalty, and are not using at all some of the Ideal machines on which they would have to pay a lower royalty.

The characteristic and unique feature of the Ideal machine was the upward wipe which it imparted to the upper over the end of the toe. In the Chase machine the wipers had only a substantially horizontal movement to work the upper in over the feather edge of the insole and against the rib. The Ideal had this upward wipe over the toe, and at the conclusion of that upward movement the wipers were moved in to force the upper materials against the rib of the insole.

As to the stability of the toe lasting head in the Ideal machine, the wipers were supported at a substantial distance away from their acting edges on a head which was secured to the machine by a couple of levers pivoted under the wipers, which constituted the only support for the toe lasting head. This is well shown in the drawings of Grandy patent No. 552,834, January 7, 1896,

(a copy of which is in defendants' Exhibit 152) which shows the construction of the toe lasting head of the Ideal machine. The wipers 10 were carried on a rod 14, and the pivot to which I referred is marked 3. The toe lasting head was supported only by that proof and two levers, 2. The screw 4 served to tip the head to change the inclination of the wipers lengthwise of the machine, and it had no other utility. The support afforded by it was almost negligible.

The holddown was attached to one side of the machine and was operated to hold the last down on the toe rest, which is shown in other figures of this patent.

1209 The part 2 was frequently breaking in the operation of the machine on men's shoes. It was this characteristic of the organization of the machine which constituted its weakness in its use on men's shoes. Owing to the fact that the wipers were supported so far from their acting edges, and that there was lack of support for the toe-lasting head directly under the wipers, the wipers sprung so that they would not seat the upper materials properly against the lip of the insole, and owing to the strain there was frequent breakage.

That weakness in the organization of the machine which I have described didn't affect its successful operation in operating on women's shoes. The strain is so much less than that which the machine encounters in lasting men's shoes that the machine was strong enough for its operation upon women's shoes. But when it came to deal with the heavier leather of men's shoes, then the difficulty disclosed itself. The Chase machine didn't have this upward wipe across the face of the toe, which I have explained in discussing the Ideal machine, and had only a substantially horizontal movement. It therefore was provided with what was known as a retarder, which bore down on the upper materials, spread back over the wipers, and prevented frictionally the slipping of the upper stock as the wipers were moved forward, in that way the necessary strain being obtained to get an upward pull on the stock over the toe as the wipers moved in. That worked satisfactorily on the heavier leathers of men's shoes, but on the lighter leathers of women's shoes it would pull the stock along the centre of the shoe and would result in bowing or bending the tip seam forwardly, which of course was bad shoemaking and spoiled the shoe.

PUTNAM, J. Your petition alleges that the Goodyear lasted ten per cent.

Mr. GREGG. Yes.

PUTNAM, J. That I suppose was the Ideal.

Mr. GREGG. That was the Ideal machine.

The WITNESS. Thirty-four hand method lasting machines were under lease prior to the organization of the company. Other machines were out, but the manufacturers wouldn't take them; the machines were being knocked around from pillar to post. They didn't stick. They would be sent out on trial and they wouldn't stay.

1210 At that time this machine did not have mechanism for putting the wire around the toe, but it had to drive tacks around the toe, just as they are driven on the sides in the exhibits of lasted shoes; but they had to be driven closer together around the toe on account of the crimping of the upper at the toe, and the greater thickness of the upper materials, including the box toe. In order to last a toe properly it was frequently desirable to give several pulls upon the same portion of the stock at the toe by the pinchers, and that could not be done, because since the machine drove a tack at every operation of the pinchers, the tacks would be driven one upon another. If they attempted to take hold of a portion of the stock near that or closely adjacent to that just acted upon, the tacks would be driven so close to gether that they would cut the stock and spoil the leather. Then, of course, the presence of some of those lasting tacks or of stay tacks, if they were driven to take their places, interfered seriously with the operation of the welting machine. The needles would break.

And more than that, until this wiring attachment was placed upon the machine the machine would not force the upper properly against the rib of the inner sole, and it was necessary to perform a subsequent hand operation upon the shoe by means of what was known as a "banging iron," one of which is defendant's Exhibit 340. Some factories had such irons shaped to fit the toe of every last which they were using, while in other factories a "banging iron" of curved contour was used step by step about the shoe. In using the "banging iron" the operator held it against the toe and struck it with a hammer at various places until he had succeeded in driving the upper stock inwardly against the rib of the insole. That was a subsequent additional hand operation for which operators were paid two and one-half cents per dozen.

These difficulties with the hand method welt machine affected its acceptable introduction among manufacturers.

The attachment for placing wire instead of tacks around the toe was first adopted and applied to the hand method welt lasting machine in January, 1900, in its original form. The wire attachment was improved a year later, but the machine really

reached a point of commercial success with the adoption of the first wire attachment.

As to the testimony of one witness for the United States that the Ideal machine lasts shoes better and is a better lasting machine than the No. 5, what I have to say to that is that for several years, and since some time prior to the beginning of this suit, it has been an accepted fact in the industry that the No. 5 machine did better work and more of it than the Ideal. That fact is capable of very easy and simple demonstration.

The difficulty in the successful use of both the Chase and the Ideal machines was due to the development of the industry
1211 towards the so-called crooked lasts. On lasts such as are used now and have been used for the past ten years the Ideal machine would not get the upper materials properly against the rib of the insole on the inside of the shoe, and it could not, for the reason that the wipers moved in a line which was the median line of the machine. They also could not get the upper stock, including the counter, properly against the side of the last, on the inside of the shoe, for a similar reason.

The essence of the No. 5 machine is that it incorporates the idea of moving the wipers at both toe and heel upon lines which bisect the toe and the heel. The heel-lasting mechanism is pivoted at a point which is the point of intersection of those two bisecting lines. It is swung to such a point that when the wipers at the toe move in they move upon that bisecting line at the toe; and when the wipers at the heel and the heel band move in, they move upon a line which bisects the heel end of the shoe.

The operations of the wipers of the Ideal and Chase machines at the heel and toe may be illustrated by the model of defendants' Exhibit 138 and the last pattern of defendants' Exhibit 139, the rib on which represents the rib of an insole.

The operation of the wipers of the No. 5 machine at the heel and toe are illustrated in the model of defendants' Exhibit 141, which may be demonstrated with the aid of the metal pattern of defendants' Exhibit 139. It will be observed that when the wipers of this model are moved in, they move alike on both sides of the toe, and when they come to rest in their final position they engage in the same way on both sides the metal rib on the pattern, which represents the rib of an insole. The wipers at the heel operate in the same way.

Also with this machine it was possible for the first time to force the counter into close engagement with the last on the inside of a shoe made on a crooked last. In the Ideal and Chase machines the heel band would engage the last at the end of the counter on

the outside of the shoe before the heel band on the inside of the shoe had got really near to the last. Consequently it was practically impossible to last properly the heel ends of shoes made on crooked lasts by either the Ideal or Chase machines.

After the No. 5 lasting machine was developed the demand from shoe manufacturers for Ideal machines ceased altogether, and most of them have been returned and exchanged for No. 5 machines. It was just the same in the case of the Chase machine.

As to the use of the Chase lasting machine on women's shoes, so far as I can learn the Chase lasting machine was never
1212 used, either before or after 1899, in lasting women's welt shoes. There was not one Chase lasting machine in Lynn, the great women's shoe center, in January, 1899. So far as I know, there has never been one there.

I obtained this information from records of the United Company. Lynn is the greatest center for making women's shoes. More shoes are made there than in any other city and they are all women's, or practically all.

Defendants' Exhibit 341 (Rec., p. —) is a list of the Plant patents claiming inventions embodied in the Plant machines.

Defendants' Exhibits 357 and 358, which are physical exhibits, comprise copies of the patents named in defendants' Exhibit 341.

Defendants' Exhibit 342 (Rec., p. —) is a list of the patents acquired from Plant, the inventions of which have been incorporated in the machines of the United Company.

1213 Defendants' Exhibit 359, a physical exhibit, comprises copies of the patents named in defendants' Exhibit 342.

Cross-examination:

I do not believe I have ever completely lasted a pair of shoes on a lasting machine, and my testimony about these several lasting machines is to be understood as technical information. It is not based upon experience that I have had in lasting shoes personally.

The McKay Shoe Machinery Company, with which I was connected prior to the formation of the United Company, did not have anything to do with lasting machines. While I was with that company I observed lasting machines when I was in shoe factories.

As to whether I said that shoe manufacturers would not take the hand method machines for welt work prior to the formation of the United Company—I did not intend to express it quite that way; thirty-four of them had been leased for use on welt shoes. Douglas had 17 Ideal machines but he was not using

them much. At that time he was manufacturing men's shoes exclusively. He had a large number of other machines. I think they were Chase machines. As to how I know that he was not using the Ideals—well, I don't know that my testimony on that point would be competent; I don't know it personally, from observation in his factory at that time. I have learned it from others. I suppose it is all hearsay; I don't doubt it is a fact, but perhaps I can't testify to it.

Prior to the formation of the United Company there were approximately 40 Ideal machines in factories where men's shoes were made exclusively. Douglas had 17; Whitman & Keith had 7; Ara Cushman, of Auburn, Maine, had 6; and Banister, of Newark, New Jersey, had 6. There were a few more in other factories. I don't know that there was one in Florsheim's factory then. I can ascertain. They were manufacturing men's shoes and women's also, I think, at that time. I don't know whether the Ideals were used there on men's shoes or not. I don't think they were.

In speaking of the Ideal machine I did not intend to include the Copeland rapid machine. That was practically obsolete in 1899.

Q. Was there any difference between the Copeland rapid and the Ideal?

A. There was a great deal of difference.

Q. What was it?

A. Practically the only similarity was the fact that both machines were organized for the upward wipe at the toe, and the constructions by which that effect was obtained were substantially different, radically different in the two machines. In all other respects the machines were substantially different; in most respects radically different.

Q. Then the Ideal machine was the better machine than the Copeland rapid?

A. Oh, yes, indeed.

Q. At the time the United was formed?

A. Yes, sir. The Copeland had practically been killed by the new high speed Chase lasting machine, which was introduced in 1895.

1214 Q. Now, taking the same grade of leather, the same weight of leather, Mr. Howard, in a man's shoe as is used in a woman's shoe, then there was nothing to prevent the Ideal machine from being used on both shoes, was there?

A. Yes, sir; because the dimensions of a man's shoe and a woman's shoe are substantially different. The power required

for lasting a man's shoe is much greater than that required for lasting a woman's shoe.

Q. I thought you said the principal difference was the weight of the leather—that the Ideal machine was too light for the men's shoes.

A. That was one difference. Your question excluded that, as I understood it. Now I am explaining that there is a more substantial reason in the size of the shoe, in the sizes of the shoes, in the way that they are put together. You assume, I understand, that the upper leather for the man's shoe and the woman's shoe that you are considering is the same, which is quite an assumption.

Q. To such an extent that it would not make any difference as far as the weight of the leather is concerned, the grade of the leather?

A. But the box toe is never the same. The box toe in a man's shoe is heavier and stiffer and must be because it has so much more to do——

Q. All men's shoes don't have box toes, do they?

A. Practically all. If they didn't have a box toe they would fall in at the toe.

Answering the question whether a good many men's shoes are not made without the box toe, perfectly smooth to the toe of the shoe—you are talking about a toe tip. That is not the box toe that you see there. The box is inside. The box is made of a stiff piece of sole leather or other material, and it is inserted between the upper leather and the lining at the toe. That is done regardless of the presence or absence of the toe tip. It is not a fact that anything more than a negligible proportion of the number of men's shoes made are made without box toes. Practically all men's shoes have box toes.

I said there were between 100 and 200 Ideal machines in factories where nothing but women's shoes were made, and fifty in factories where both men's and women's shoes were made. I know some of those factories. It is pretty hard to identify the Ideal machines used before 1899, because the records of the Goodyear Company were not nearly as complete as those of the Lasting Machine Company. I satisfied myself as to the kind of work done on nearly all of the machines by an extended investigation as to the kinds of shoes which were being made in 1899 by manufacturers using the machines.

1215 FEBRUARY 10, 1914.

SIDNEY W. WINSLOW, witness for defendants, recalled.

At the request of Judge Putnam I have prepared a statement with reference to the service rendered by the United Company,

showing the number of stations, the number of men employed, the expense or rendering the service, the investment in parts and any other useful details. This statement is as follows:

Memoranda requested by Judge Putnam regarding repair service, year 1911.

Men to repair machines and instruct operators were stationed in the following places:

Auburn, Me.; Haverhill, Mass.; Lynn, Mass.; Manchester, N. H.; Marlboro, Mass.; Brockton, Mass.; New York City, N. Y.; Rochester, N. Y.; Lestershire, N. Y.; Philadelphia, Pa.; Harrisburg, Pa.; Cincinnati, Ohio.; Chicago, Ill.; Milwaukee, Wis.; St. Paul, Minn.; St. Louis, Mo.; New Orleans, La.; San Francisco, Cal.

Also at the following substations:

Augusta, Me.; Gardiner, Me.; Rochester, N. H.; Nashua, N. H.; Derry, N. H.; Newburyport, Mass.; Auburn, N. Y.; Baltimore, Md.; Lancaster, Ohio.

Number of principal stations	18	
Number of substations	9	
		27
Number of men at stations		608
Salary and expense for service		$1,196,494.86
Investment in parts		$1,415,474.49
Number of new operators taught in shoe factories		8,889
Number of calls made		201,413
Average cost of each call		$5.95

In addition to the above there were thirty-four (34) men who traveled from the Boston office and gave special service to shoe manufacturers, such as economy and quality of manufacturing, rearrangement of factories, improved methods of manufacturing, etc.

Data relative to road service, year 1911, at branch office, Auburn, Maine.

Repair men and instructors located at Auburn	29
Number of new operators taught for manufacturers at Auburn during year	504
Total number of calls made	10,520

The WITNESS. A call means not only a request of us but also a compliance with the request by our sending a man.

1216 As to the percentage of the business of the United Company which is done within the State of Massachusetts, in 1912 thirty-nine and one-half per cent of the total number of shoes made in the United States by our machines were manufactured in Massachusetts.

As to papers filed by the petitioner to show that the United Company did not increase the item of patents in its trial balance after the acquisition of the Plant patents in 1910 and to show that it carried the patents at $400,000 in its trial balance sheet since that date, the United Company has carried its patents at that figure since 1903, although we spend several hundred thousand dollars every year in developing or taking out patents.

As to our accounts in connection with the cost of the Plant purchase, the United Shoe Machinery Corporation loaned to the company $3,000,000 in cash at the time of the purchase. On February 28, 1911, the stock of the Thomas G. Plant Shoe Company, the shoe manufacturing company, was transferred to the corporation and the company received credit for this $3,000,000 which it had borrowed. That stock has appeared among the assets of the corporation from that date until now.

The other $3,000,000 was carried in the account of leased machinery and stock of other corporations and it so appears in our balance sheet.

For a time after we made the purchase this was carried as a special item, until we had had opportunity to distribute it. We have now partially distributed it by adding $3,000,000 to the item, leased machinery and stock of other companies; and $3,000,000 has been transferred to and added to the assets of the corporation.

BROWN, J. I would like to inquire what the purpose of this return is.

Mr. CHOATE. It is the return required by the State laws of Massachusetts.

1217 BROWN, J. For the purpose of taxation, or simply in order that persons dealing with the corporation may know its credit?

Mr. CHOATE. I think it is partly both.

BROWN, J. For the latter purpose the more you omit the better you are conforming to the intent of the statute.

I have information with respect to the operations on lasting machines for the year 1899 and, as indicated by the returns made for the computation of royalties, a little over three-fourths of one per cent, or, to be exact, 0.77 of one per cent of all shoes reported lasted in the year 1899 were lasted on the Copeland rapid and Ideal machines. I obtained that information from the royalty returns.

Between forty-two and forty-three hundred lasting machines of all kinds were out on January 1, 1899, so that the 248 Ideal machines were about five per cent of the machines which were out.

I have been over the list of machines which Mr. Jones submitted the other day, and which purports to show the number of machines in the Commonwealth Shoe and Leather factory which were obtained from the United Company, and the number of machines obtained from others. In the list of machines which he says were obtained from the United Company I find 114 which are not machines, out of the total of 584 listed as obtained from the United Company. Of those 114, 73 are hand tackers. The hand tacker is a tool which is carried in the hand to drive the tacks used in lasting shoes with a bed lasting machine. It has no power and no power is used with it, and the operator drives the tacks as he would with a hammer. Hand tackers are not treated by shoe machinery men or shoe manufacturers as machines.

I also found, on Mr. Jones's list of what he calls machines obtained from the United Company, 36 extension edge attachments. That is the thing which is sometimes called the Baltimore edge attachment and is embodied in the outsole rapid stitcher for placing the stitches in right position on the outer sole. Mr. Jones called that a machine, as well as the machine to which it was attached.

(Examination of Mr. Winslow suspended, at request of counsel for defendants, to accommodate the next witness.)

1218 FEBRUARY 10, 1914.

BICKNELL HALL, witness for defendants, recalled.

In explanation of my previous testimony, the American Worsted Machinery Company makes eyeleting machines and they are sold for us by dealers, who are practically our agents.

FEBRUARY 10, 1914.

SIDNEY W. WINSLOW, witness for defendants, resumed.

Direct examination resumed:

Referring again to the 114 devices and attachments which Mr. Jones called machines on his list, five of those were old style beveling attachments. Those are attachments that go on the machine for beveling the welt. They are not machines at all.

Of the remaining 470 machines on his list which he calls machines obtained from the United Company, 119 machines are sold both by the United Company and by other people, so that he could have gotten them from others. Those machines are listed in defendants' Exhibit 343 (Record, p. —).

I was asked on cross-examination whether I could say how many of the 706 manufacturers who held machines on unre-

stricted leases in 1905 had principal machines on unrestricted leases. I have since had that looked up, and I have ascertained that there were 186 unrestricted leases of principal metallic machines, 536 unrestricted leases of heel attaching machines, and 322 unrestricted leases of lasting machines. Of the 706 manufacturers, only one had an unimportant machine on the unrestricted lease, a Busell heel trimmer, and eleven had machines of the heeling department upon which they paid royalty, other than the heel attaching machine which is a principal machine.

We began to put out the newly designed model B McKay sewing machine early in 1908. Just before or about that time we began to put out the Richardson design McKay sewing machine, which had been put out by the Richardson Company prior to that time.

I have made an investigation to determine what kinds of McKay sewing machines were in use in 1909 and by whom they were furnished. In the districts of Auburn, Brockton, 1219 Chicago, Cincinnati, Haverhill, Lynn, Marlboro, New Orleans, New York, Philadelphia, Rochester, San Francisco, and St. Louis, which comprise substantially the districts in which shoes are made, there were 155 model B McKay sewing machines, 153 Richardson machines, and 1,180 of the old style McKay sewing machines which were furnished by everybody, that is, there were 308 model B and Richardson machines out of a total of 1,488 machines. We had not begun to put those machines out until the year before, and prior to that time the market was supplied by the old style machines.

The situation is well illustrated in Lynn, where in 1909 there were 367 old style McKay sewing machines in the factories and 59 of the model B and Richardson combined.

Referring to the advertisements about the hand method welt lasting machine, which were offered by the United States, the situation with reference to the hand method welt lasting machine prior to the organization of the United Company was as follows:

The first introduction of the hand-method welt lasting machine was some time in 1897, and we were endeavoring to introduce that machine, and at the same time to perfect it. It has always been the custom of the company to perfect their machines by getting them into factories. Early in 1898, in the lasting of welt shoes by the bed machine principle, they had adopted the taping of the toes, thereby doing away entirely with the necessity for any tacks being used to hold the toe, which is a great advantage to the welt-sewing operation. As soon as that was adopted in the bed machine, really in the Chase, the manufacturers com-

menced to stop the use of the hand-method welt lasting machine. And while it is true that we had machines out it is true that they were not being accepted by the manufacturers and they were being sent out and coming back. We were trying all the time to keep them going.

We did not adopt the taping device on the hand method machine, but in 1900 we adopted the wiring device which performed the same function.

I do not know how many hand method welt machines we had out just prior to the organization of the United Company. There were only thirty-four of them leased. We were trying to hold them in the field, but we knew that they were not commercially successful. I did not have any personal knowledge of the advertising which the petitioner has put in evidence. I assume that it was entirely the work of our advertising men.

1220 Cross-examination:

Referring to my statement as to the number of shoes being manufactured on the Ideal lasting machine, based on the royalty, during the first year after the United Company was formed; there was a royalty on the Ideal machine prior to the time the United Company was formed. Prior to 1898 the custom of the Goodyear Company had been to put Ideal machines out on a large initial payment and no royalty, limited to use with Goodyear welt sewing and outsole stitching machines. The best of my recollection is that early in 1898 the Goodyear Company abandoned that policy, and adopted the policy of putting them out on an initial premium of $300 with a royalty of half a cent a pair.

In respect to the $400,000 that we carry in our financial statement as patent rights, I can not state what the amount was prior to 1903, but we carried them at $408,000 in 1903, and at $400,000 in 1904, and they have remained at that figure ever since.

In respect to the 119 machines which Mr. Jones claimed he had from the United Company, and which I testified might have been obtained from some one else, I do not know as a matter of fact whether or not any of those machines were obtained from others, and it is possible that they were all obtained from our company. I assume that Mr. Jones was correct in stating that they were obtained from our company.

The auxiliary devices and attachments on Mr. Jones's list, about which I testified, were obtained from our company, but they are not machines nor are they listed by us as machines. In making up his total number of machines he has counted attach-

ments as machines, in his comparison with machines obtained from other people.

On my memorandum regarding repair service for 1911, the item "Investment in parts, $1,415,474.49" does not include the parts that are carried for the manufacture of machines. It is not the entire amount that we have invested in parts, but 1221 is the investment in the stock of parts which we carried during the year 1911 in order to furnish the service of putting machines in repair. It is not the entire amount that we have invested in parts. It does not include any parts for new machines.

The item on that memorandum "Salary expense for service, $1,196,494.86" is the expense of keeping up the branch offices throughout the country so far as allotted to the expense of the service, but not in connection with the selling organization. Those figures on that memorandum are confined strictly to the service.

The 201,413 calls made were all cases where a manufacturer made a request for a man to come to his factory. It may have been a request for repairs, or a request for a man to come to their factory to adjust machines, or service of that sort.

Mr. CHOATE. While the United States was putting in its case attention was called to the fact that the United Shoe Machinery Company carried out its plan for the distribution of stock to people who observed the conditions of their leases, and we asked Mr. Fowler to produce a letter which we sent to the Attorney General, advising him of the fact that we were going to carry out the plan, and he produced it. And I desire to put it in. It is dated February 7th, 1913.

PUTNAM, J. Have you any objection, Mr. Gregg?

Mr. GREGG. No objection. I don't see what effect it has, but I have no objection.

Mr. CHOATE. It was addressed to Mr. Wickersham. It is as follows:

DEFENDANTS' EXHIBIT 344.

CHOATE, HALL, & STEWART,
Boston, Mass., Feb. 7, 1913.

Hon. GEORGE W. WICKERSHAM,
Attorney General, Department of Justice, Washington, D. C.

MY DEAR MR. WICKERSHAM: In 1910 the United Shoe Machinery Company advised its lessees that it proposed to put in effect a plan by which a certain proportion of the royalties should be invested in stock of the corporation, and at the end of a fixed term be distributed to lessees of the Goodyear welt-

ing and stitching and turn-sewing machines, who had in all respects observed the obligations of their leases. The period covered by this plan expired December 31, 1912, and the company proposes to make a distribution on or about March 1st, as it is bound to do by its agreement with the customers.

1222 This plan was, I think, fully called to the attention of Mr. Gregg while he was here examining the affairs of the company and as I read the bill in equity filed by the United States against the company, it does not seem that any complaint is made upon this ground. Under these circumstances, the Company proposes to make the distribution provided for in that plan on the first day of March, or as soon as possible thereafter; and has desired me to call the matter to your attention that the plan may not be carried out without the knowledge of your department.

I send you herewith a copy of the circular of June 10th, 1910, which describes the plan.

Very truly, yours,

CHAS. F. CHOATE, jr.

(Here follows a copy of the circular of June 10, 1910, which is plaintiff's Exhibit 146, Record, p. —.)

Mr. GREGG. Was that acknowledged, Mr. Choate?

Mr. CHOATE. That was never acknowledged or answered, but it was produced and it appears that it has been received.

PUTNAM, J. Who was it signed by?

Mr. CHOATE. I signed it.

PUTNAM, J. In behalf of the corporation?

Mr. CHOATE. Yes, sir.

PUTNAM, J. You signed it as counsel for the corporation?

Mr. CHOATE. No, sir; I just signed my name, but he knew I was counsel for the corporation.

His Honor Judge Putnam asked about the price at which the United Company carried its patents prior to 1903. Plaintiff's Exhibits 180, 181, and 182 give those figures. In 180 the financial condition March 1st, 1901, shows patent rights $745,269.27. The statement of financial condition March 1st, 1902, shows they were marked down to $571,332.23, and March 1st, 1903, marked down still further to $408,021.75; and from that date on each annual exhibit shows they carried them at just $400,000.

1223 FEBRUARY 10, 1914.

HAROLD G. DONHAM, witness for defendants, recalled.

The pulling-over lease of plaintiff's Exhibit 37 was reprinted several times before the adoption of the lease of plaintiff's Ex-

hibit 38 in 1909, and in the reprinted leases the additional machinery clause had been stricken out long prior to 1909. Defendants' Exhibit 345 is a redraft of the lease of Exhibit 37, containing substanially, the same terms, but with the additional machinery clause omitted. That lease was ready for use at least as early as 1907, and it may have been earlier than that; I found copies in use dated as early as 1907.

Cross-examination:

Leases of the form of defendants' Exhibit 345 were executed and put out to shoe manufacturers. Whenever that lease was printed it superseded the lease of plaintiff's Exhibit 37, which was the first one we got up for the pulling-over system, and which was reprinted several times before we got to the lease of plaintiff's Exhibit 38. There were some substantial changes in the lease of Exhibit 38.

After the lease form of defendants' Exhibit 345 was adopted, if there were machines outstanding on leases of plaintiff's Exhibit 37 they would not be called in, except as they came in in the ordinary course of trade, were exchanged for other machines, and the later forms of lease were taken.

1224 JANUARY 14, 1914.

Discussion of petitioner's motions to strike out certain testimony taken before the examiner.

Mr. FOWLER. The first motion is to strike out all the evidence with reference to patents, introduced before the examiner with reference to patents and machines which was not responsive to the evidence introduced by the United States.

The second one is to strike out all patents and all evidence with reference to patents which were issued after the filing of the petition.

Let me make a statement, your honors, which I think my associates will agree with. Of course, we are not here to discuss the general patent question or to insist that the defendants in this case have not got a perfect right to put this testimony into the record—that is, the testimony that was taken before the examiner. But our position is that they did not have any right under that order to introduce it before the examiner. Now, as I understand Mr. Fish and Mr. Choate, they insist that if it is stricken out, which I think your honors would probably have to do under the terms of the order, they would have to introduce it before your honors in open court.

Mr. FISH. Exactly.

Mr. FOWLER. Now, of course we don't want to go through that again. But you can see the position which we are in here. Mr. Webster had to do just as he did do, and the consequence is that he did not cross-examine the witnesses as to those matters, nor did he introduce testimony in rebuttal to it. Now, I think that I can state this—that we are willing to treat that testimony as in if your honors will give the opportunity for that matter to be taken up before the examiner—unless your honors want it to be done in open court—and let Mr. Webster have an opportunity to cross-examine the witnesses on those matters and to introduce what evidence he wants to in rebuttal of that testimony relating to those various machines.

1225 BROWN, J. Well, you allege in substance that here was a clear unpatented field in which people would be dealing as free agents.

Mr. FOWLER. As to the basic patents on the essential machines.

BROWN, J. As to the principal machines in the art. The defendants meet that by showing a very large number of patents in that field, which meets your allegations as to a free field. They show a legally monopolized field as distinguished from what you say would have been the field of free, unrestricted competition.

Mr. FISH. They say there is a fundamental patent expiring in 1910, or a patent which we assume they are going to call a fundamental one, or a basic patent, because they put it in. We want the right to say that at that time that patent had been supplanted by another invention—the invention of that patent had been supplanted by another invention which was enormously better and which the public demanded. That invention was the subject of an application which came out the day after the bill was filed, and we think we have a right to say that. We also think we have a right to say that at the time of the expiration of this patent in 1910 we had procured or made another invention germane to that machine, embodied in the machines we were putting out, and which our customers insisted upon having under their leases, which was vastly more important than this one that expired, more truly basic, more nearly bringing that machine into the status of a principal machine because it was such a step in advance. That invention had been made, had been worked out, had been put into the machine. The application was filed in 1908. That particular patent happened to come out the day after the bill was filed by the Government. What difference does it make, may it please the court, whether

it came out the day after or the day before? Those particular inventions are the things that are of importance, and their effect upon giving character and standing and position to our machines. We want to show that fact.

1226 Mr. WEBSTER. It seems to me it is important to learn at an early date, however, whether patents issued after the filing of the bill and machines made under those patents are to be considered by the court.

DODGE, J. Applications that were pending, before the filing of the bill?

Mr. WEBSTER. Yes. In one or two instances I think there are patents introduced where applications were filed after the filing of the bill. If they were introduced, it was accidental.

PUTNAM, J. They were only very limited.

Mr. GREGG. We take the position that the testimony went in before the examiner without any authority under the order, and Mr. Fish and Mr. Choate take the other view of it. So far as having that question passed upon, I don't care anything about it at all. All I am interested in now is an opportunity to cross-examine Mr. Howard with respect to that testimony, and put in such testimony as we may deem proper in reply to the testimony introduced by the defendant.

Mr. FISH. Why wouldn't it settle the whole thing if the objection were withdrawn and we submit Mr. Howard to further cross-examination and consent to their taking the testimony in rebuttal to Mr. Howard's testimony before the master? Isn't that all right? I mean assuming that you come to that conclusion.

Mr. CHOATE. I agree to that.

Mr. FISH. Then there will be no order, no stipulation or anything, except an understanding that we shall all live up to, which the court will enforce if necessary.

BROWN, J. It will be an understanding in open court taken by the stenographer.

Mr. FISH. Certainly.

Stipulation.

1227 (January 14, 1914—Filed January 19, 1914.)

"With reference to the motions of the United States relating to the admission of testimony before the special examiner, which motions are shown by and printed in the record on pages 2841 ( ) and 2846 ( ), the United States withdraws its motions and waives its objections founded on the claim that the evidence was improperly taken before the special examiner,

reserving all other objections for irrelevancy and incompetency heretofore or hereafter made, with the understanding, to which the court assents and agrees, that the United States may make further cross-examination or introduce evidence in rebuttal with reference to the matters to which the objections and motions relate, the further examination and cross-examination to proceed before the special examiner or proceed at the resumption of the hearings on the 3rd of February in open court, as the parties may hereafter agree or the court may order."

FEBRUARY 10, 1914.

1228 *Order of February 10, 1914.*

In the course of the discussion of the form of the order entered February 10, 1914 (infra, p. —), the following statements were made by counsel and the court.

Mr. GREGG. Mr. Webster suggests that in order that there may be no doubt about our expert testifying in connection with the machines obtained from Mr. Plant, that is, the application of the patents to the machines, that in the last part of the first paragraph of the order it should read:

"with respect to patents and machines obtained by the defendants from Thomas G. Plant."

Mr. CHOATE. Well, we didn't obtain any machines from him. We obtained patents and inventions.

Mr. GREGG. As I understand it, what Mr. Webster wishes is to compare the patents with the machines for the purpose of ascertaining whether or not the machines are constructed in accordance with the patents.

Mr. CHOATE. Well, that he has been doing as he wanted to. We have been giving him every opportunity to do it.

Mr. WEBSTER. Why, I think in order to avoid any disagreement we ought to have it understood that the order is sufficiently broad to allow our expert to examine the machines and compare the structure of the machines with the patents in order to determine the question as to whether the machines are constructed as set out in the patents.

Mr. CHOATE. Well, I don't understand that that is a proper subject for the order. They have requested an opportunity to see the machines and we have put them at their disposal. They have had every opportunity they desire; but if you mean simply that the witness may testify as to whether he finds the patents in the machines, why, I should think that was a matter of course. Of course he would.

1229 Mr. WEBSTER. This goes to the question of the scope of the testimony in interpreting the patents and comparing the machines with them.

BROWN, J. You mean the Plant machines in the Plant factory?

Mr. GREGG. The Plant machines, as I understand it.

Mr. WEBSTER. The Plant machines, and also the machines of the United Company which it is alleged have incorporated in them the inventions of the Plant patents.

Order.

(February 10, 1914.)

PUTNAM, DODGE, and BROWN, JJ. With the consent of the parties, it is ordered that the United States shall have from February 24 to March 10, 1914, inclusive, for further cross-examination of Nelson W. Howard and the introduction of evidence in rebuttal before the special examiner, Charles K. Darling, with reference to the matters provided for in the order entered in this cause on January 14, 1914; and also to introduce evidence before the special examiner in rebuttal to evidence submitted by the defendants in open court with respect to patents and machines obtained by the defendants from Thomas G. Plant.

And the defendants shall have from March 11 to March 24, 1914, inclusive, to introduce evidence in surrebuttal with respect to the evidence of the United States relating to matters provided for in the order of January 14, 1914, and evidence introduced by the United States before the special examiner with respect to patents and machines obtained by the defendants from Thomas G. Plant.

The court reserves control of the proceedings before the special examiner.

By the court:

CHARLES K. DARLING, *Clerk*,
By JOHN E. GILMAN, Jr.,
Deputy Clerk.

C. F. C., Jr.
Wm. S. G.

1230 UNITED STATES OF AMERICA,
District of Massachusetts, ss:

This volume is one of the volumes of testimony and exhibits referred to in the order of court, entered June 19, 1916.

Attest:

[SEAL.] WILLIAM NELSON, *Clerk.*

1232 District Court of the United States, District of Massachusetts.

UNITED STATES OF AMERICA *v.* UNITED SHOE MACHINERY COMPANY, of New Jersey, et al.	In Equity. No. 301 (C. C. 911).

Petition.

[Filed December 12, 1911.]

To the honorable the Judges of the Circuit Court of the United States for the District of Massachusetts, sitting in equity:

The United States of America by Asa P. French, its attorney for the district of Massachusetts, acting under the direction of its Attorney General, brings this proceeding in equity against United Shoe Machinery Company, of New Jersey; United Shoe Machinery Corporation; United Shoe Machinery Company, of Maine; United Shoe Repairing Machine Company; United-Xpedite Finishing Company; United Awl & Needle Company; United Fast Color Eyelet Company; O. A. Miller Treeing Machine Company; W. W. Cross & Company, Inc.; S. A. Felton & Son Company; Campbell-Bosworth Machinery Company; Boston Blacking Company; J. C. Rhodes & Com-
1233 pany (Inc.); The Rimmon Eyelet Company; Ross-Moyer Manufacturing Company; J. K. Krieg Company; Booth Brothers Company; S. O. & C. Corporation; Ellis Lacer Company; Thomas G. Plant Company; Sidney W. Winslow; William Barbour; Wallace F. Robinson; George W. Brown; Edward P. Hurd; John H. Connor; Louis A. Coolidge; Edwin P. Brown; Frank L. Babbott; Henry B. Endicott; Edmund LeB. Gardner; John H. Hanan; Elmer P. Howe; Joseph C. Kilham; George E. Keith; Rudolph Matz; Charles G. Rice; Alfred R. Turner; Samuel Weil; Frank Wood; William Woodward; Edward N. Chase, and Harold G. Donham.

On information and belief, your petitioner alleges and shows:

I.

DESCRIPTION OF DEFENDANTS.

United Shoe Machinery Company, of New Jersey, is a corporation organized under the laws of New Jersey, carrying on business in the district of Massachusetts, with its offices and place of business at Boston, Mass., where its president, defendant Sidney W. Winslow, may be found.

Its issued capital stock is		$20,850,519.00
Preferred	$9,971,584.50	
Common	10,878,934.50	

United Shoe Machinery Corporation is a corporation organized under the laws of New Jersey, with its offices and place of
1234 business at Boston, Mass., where its president, Sidney W. Winslow, may be found.

Its issued capital stock is ---------- $38,114,833.75
Preferred ---------- $9,515,400.00
Common ---------- 28,599,433.75

United Shoe Repairing Machine Company is a corporation organized under the laws of Maine, with its offices and place of business at Boston, Mass., where its president, defendant Sidney W. Winslow, may be found.

Its issued capital stock is ---------- $50,000

United Shoe Machinery Company, of Maine, is a corporation organized under the laws of Maine, with its offices and place of business at Boston, Mass., where its president, defendant Sidney W. Winslow, may be found.

Its issued capital stock is ---------- $3,000,000

United-Xpedite Finishing Company is a corporation organized under the laws of Maine, with its offices and place of business at Boston, Mass., where its president, defendant Sidney W. Winslow, may be found.

Its issued capital stock is ---------- $1,000,000

United Awl & Needle Company is a corporation organized under the laws of Maine, with its offices and place of business at Boston, Mass., where its president, defendant Sidney W. Winslow, may be found.

1235 Its issued capital stock is ---------- $56,100
Preferred ---------- $13,700
Common ---------- 42,000

United Fast Color Eyelet Company is a corporation organized under the laws of Maine, with its offices and place of business at Boston, Mass., where its president, defendant Sidney W. Winslow, may be found.

Its issued capital stock is ---------- $1,478,600
Preferred ---------- $478,600
Common ---------- 1,000,000

O. A. Miller Treeing Machine Company is a corporation organized under the laws of Maine, with its offices and place of business at Brockton, Mass. Its president is defendant Sidney W. Winslow.

Its issued capital stock is ---------- $200,000

W. W. Cross & Company (Inc.), is a corporation organized under the laws of Maine, with its offices and place of business at Brockton, Mass. Its president is defendant Sidney W. Winslow.

Its issued capital stock is ---------- $200,000
Preferred ---------- $100,000
Common ---------- 100,000

S. A. Felton & Son Company is a corporation organized under the laws of Maine, with its offices and place of business at Manchester, N. H. Its president is defendant Sidney W. Winslow.

Its issued capital stock is---------- $40,000

1236 Campbell-Bosworth Machinery Company is a corporation organized under the laws of Maine, with its offices and place of business at Boston, Mass., where its president, defendant Sidney W. Winslow, may be found.

Its issued capital stock is---------- $500,000

Boston Blacking Company is a corporation organized under the laws of Maine, with its offices and place of business at Boston, Mass.

Its authorized capital stock is---------- $600,000

J. C. Rhodes & Company, Inc., is a corporation organized under the laws of Maine, with its offices and place of business at New Bedford, Mass. Its president is defendant Sidney W. Winslow.

Its issued capital stock is---------- $600,000

The Rimmon Eyelet Company is a corporation organized under the laws of Connecticut, with its offices and place of business at Seymour, Conn. Its president is defendant Harold G. Donham.

Its issued capital stock is---------- $200,000

Ross-Moyer Manufacturing Company is a corporation organized under the laws of Ohio, with its offices and place of business at Cincinnati, Ohio. Its president is defendant Sidney W. Winslow.

Its issued capital stock is---------- $197,400

J. K. Krieg Company is a corporation organized under the laws of New York, with its offices and place of business at New York City. Its president is defendant Sidney W. Winslow.

1237 Its issued capital stock is---------- $50,000

Booth Brothers Company is a corporation organized under the laws of New York, with its offices and place of business at Rochester, N. Y. Its president is defendant Sidney W. Winslow.

Its issued capital stock is---------- $25,000

S. O. & C. Corporation is a corporation organized under the laws of Maine, with its offices and place of business at Ansonia, Conn. Its president is defendant Sidney W. Winslow.

Its issued capital stock is---------- $740,000

Ellis Lacer Company is a corporation organized under the laws of Maine, with its offices and place of business at Boston, Mass. Its president is defendant Edward N. Chase.

Its issued capital stock is---------- $50,000

Thomas G. Plant Company is a corporation organized under the laws of New Jersey, with its offices and place of business at Boston, Mass.

Its issued capital stock is---------- $3,750,000

Preferred---------- $2,500,000

Common---------- 1,250,000

Individual defendants Frank L. Babbott, Henry B. Endicott, Edmund LeB. Gardner, John H. Hanan, Elmer P. Howe, Joseph C. Kilham, George E. Keith, Rudolph Matz, Charles G. Rice, John H. Connor, Alfred R. Turner, Wallace F. Robinson, Samuel Weil,
Frank Wood, and William Woodward are directors of United
1238 Shoe Machinery Company, of New Jersey, and United Shoe
Machinery Corporation, attend the meetings of the boards, participate in the direction and management of the business of said companies, and are responsible therefor.

Defendant Sidney W. Winslow is president and director of United Shoe Machinery Company, of New Jersey; United Shoe Machinery Corporation; United Shoe Repairing Machine Company; United Shoe Machinery Company, of Maine; United-Xpedite Finishing Company; United Awl & Needle Company; United Fast Color Eyelet Company; O. A. Miller Treeing Machine Company; W. W. Cross & Company (Inc.); S. A. Felton & Son Company; Campbell-Bosworth Machinery Company; J. C. Rhodes & Company (Inc.); Ross-Moyer Manufacturing Company; J. K. Krieg Company; Boston Blacking Company; Booth Brothers Company; and S. O. & C. Corporation. Defendant Winslow attends the meetings of the boards, participates in the direction and management of the business of said companies, and is responsible therefor.

Defendant William Barbour is vice president and director of United Shoe Machinery Company, of New Jersey, and United Shoe Machinery Corporation; a director of United Shoe Repairing Machine Company, and United Shoe Machinery Company, of Maine, attends the meetings of the boards, participates in the direction and management of the business of said companies, and is responsible
therefor.

1239 Defendant George W. Brown is vice president and director of United Shoe Machinery Company, of New Jersey; United Shoe Machinery Corporation; and Campbell-Bosworth Machinery Company; a director of Booth Brothers Company, Boston Blacking Company, and W. W. Cross & Company (Inc.), attends the meetings of the boards, participates in the direction and management of the business of said companies, and is responsible therefor.

Defendant Edward P. Hurd is vice president and director of United Shoe Machinery Company, of New Jersey, and United Shoe Machinery Corporation; J. C. Rhodes & Company (Inc.); J. K. Krieg Company; Booth Brothers Company; S. O. & C. Corporation; United Shoe Repairing Machine Company; United Fast Color Eyelet Company; United Shoe Machinery Company, of Maine; a director of O. A. Miller Treeing Machine Company; W. W. Cross & Company (Inc.); S. A. Felton & Son Company; United-Xpedite Finishing Company; United Awl & Needle Company, and Boston

Blacking Company, attends the meetings of the boards, participates in the direction and management of the business of said companies, and is responsible therefor.

Defendant Louis A. Coolidge is a director of United Shoe Machinery Company, of New Jersey; United Shoe Machinery Corporation; O. A. Miller Treeing Machine Company; United Awl
1240 & Needle Company; J. K. Krieg Company; Ellis Lacer Company; United Shoe Machinery Company, of Maine; United-Xpedite Finishing Company; J. C. Rhodes & Company (Inc.); United Shoe Repairing Machine Company, and United Fast Color Eyelet Company; attends the meetings of the boards, participates in the direction and management of the business of said companies, and is responsible therefor.

Defendant Edwin P. Brown is a director of United Awl & Needle Company and J. C. Rhodes & Company (Inc.), attends the meetings of the boards, participates in the direction and management of the business of said companies, and is responsible therefor.

Defendant Edward N. Chase is president and director of Ellis Lacer Company.

Defendant Harold G. Donham is a director of The Rimmon Eyelet Company, attends the meetings of the board, participates in the direction and management of the business of said company, and is responsible therefor.

Defendants George W. Brown, John H. Connor, Louis A. Coolidge, Edwin P. Brown, Henry B. Endicott, Elmer P. Howe, Edward P. Hurd, Joseph C. Kilham, George E. Keith, Charles G. Rice, Wallace F. Robinson, Harold G. Donham, Sidney W. Winslow, and Frank Wood are residents of the State of Massachusetts and may be found therein.

1241 Defendants Frank L. Babbott, William Barbour, John H. Hanan, Samuel Weil, and William Woodward are residents of the State of New York and may be found therein.

Defendant Rudolph Matz is a resident of the State of Illinois and may be found therein.

Defendants Edmund LeB. Gardner and Alfred R. Turner are residents of the State of New Jersey and may be found therein.

The defendants are engaged in trade and commerce in the manufacture, shipment, sale, and lease of machines, machinery, mechanisms, tools, and devices used in the manufacture of boots and shoes, among the several States of the United States and with foreign nations, and have combined, contracted, and conspired to restrain interstate and foreign trade and commerce and have monopolized and attempted to monopolize the same, all as hereinafter set forth, in violation of the act of Congress approved July 2, 1890, entitled "An act to protect trade and commerce against unlawful

restraints and monopolies," and subsequent acts. This proceeding is instituted by the United States of America, under the direction of its Attorney General, to prevent and restrain defendants and each of them from maintaining and engaging in the unlawful combinations, contracts, and conspiracies aforesaid, and from monopolizing and attempting to monopolize the interstate and foreign trade and commerce aforesaid.

1242

II.

DEVELOPMENT AND USE OF SHOE MACHINERY.

Among the important industries of the United States is that of the manufacture, sale, and lease of machines, mechanisms, tools, and devices (hereinafter referred to as shoe machinery) used in the manufacture of boots and shoes. For twenty-five years last past practically all of the boots and shoes worn by the people of the United States have been manufactured by the aid and use of several different kinds of machines which have been and now are indispensable to the manufacture of boots and shoes in quantities sufficient to meet the demands of the public. Consequently, manufacturing plants where boots and shoes are produced by the aid and use of machinery have come into existence at divers places in the United States, there now being about thirteen hundred of such concerns, which are hereinafter referred to collectively as boot and shoe manufacturers.

The principal essential machines used in the manufacture of boots and shoes may be grouped as follows:

Lasting machines: Those designed and used for the purpose of lasting the uppers of boots and shoes.

Welt-sewing machines and outsole-stitching machines: Those designed and used for the purpose of sewing the seam which attaches the upper to the outsole of a turn shoe, and the seam which
1243 attaches the upper and welt to the insole of a welt shoe, and for sewing the welt of a welt shoe to its outsole.

Heeling machines: Those designed and used for preparing and attaching the heels of boots and shoes.

Metallic-fastening machines: Those designed and used for the purpose of preparing and inserting metallic fastenings in boots and shoes.

Some of the shoe machinery and parts thereof mentioned and described in the above groups have been and are manufactured under letters patent of the United States and of other countries. The variety of such shoe machinery and the letters patent covering the same are so great in number as to make it impracticable to set forth in this petition a detailed description of each machine and the parts thereof or of the letters patent covering the same.

III.

CONDITION OF THE TRADE IN SHOE MACHINERY PRIOR TO 1899.

For many years prior and down to February, 1899, a large number of individuals, partnerships, and corporations were engaged in the United States in the manufacture of shoe machinery and in competition with each other in its sale and lease among the several States of the United States and in foreign countries, each con-
1244 cern striving to improve its machines already on the market and to design and install new ones. The principal concerns so engaged in said shoe machinery industry were the following:

Goodyear Shoe Machinery Company, a corporation of Maine, issued capital stock $3,000,000 (120,000 shares, par value $25 each), International Goodyear Shoe Machinery Company, a corporation of Maine, issued capital stock $1,000,000 (40,000 shares, par value $25 each), and Goodyear Shoe Machinery Company of Canada, a corporation of Maine, each having its principal factory at Boston, Massachusetts, were engaged in the manufacture of machines used for sewing the seam which attaches the upper to the outsole of a turn shoe, and the seam which attaches the upper and welt to the insole of a welt shoe, and for sewing the welt of a welt shoe to its outsole, and machines used for lasting the uppers of boots and shoes. These companies manufactured 80 per cent of all such sewing machines, and 10 per cent of all such lasting machines manufactured in the United States. The said International Goodyear Shoe Machinery Company and Goodyear Shoe Machinery Company of Canada were controlled, through stock ownership or otherwise, by said Goodyear Shoe Machinery Company. All were engaged in trade and commerce among the several States of the United States and in Great Britain, France, Belgium, Germany, Austria, and the Dominion of Canada.

1245 Consolidated & Mcay Lasting Machine Company, a corporation of Maine, issued capital stock $2,888,600 (91,544 shares common and 24,000 preferred, par value $25 each), with its principal factory at Beverly, Massachusetts, was engaged in the manufacture of machines, and parts thereof, designed and used for lasting the uppers of boots and shoes, and in interstate and foreign trade and commerce in such machines, and parts thereof. This company manufactured 60 per cent of all such lasting machines manufactured in the United States.

McKay Shoe Machinery Company, a corporation of Maine, issued capital stock $5,000,000 (500,000 shares, par value $10 each), with its principal factory at Winchester, Massachusetts, was engaged in the manufacture of machines, and parts thereof, designed and used

for preparing heels and for attaching them to boots and shoes, and machines, and parts thereof, designed and used for metallic fastenings, and also in interstate and foreign trade and commerce in such machines, and parts thereof. This company manufactured at least 70 per cent of all such heeling machines, and at least 80 per cent of all such metallic fastening machines made in the United States.

Eppler Welt Machine Company, a corporation of Maine, issued capital stock $600,000, and International Eppler Welt Machine Company, a corporation of Maine, issued capital stock $500,000, each with its principal factory at Boston, Massachusetts, were
1246 engaged in the manufacture of machines, and parts thereof, used for sewing the seam which attaches the upper to the outsole of a turn shoe, and the seam which attaches the upper and welt to the insole of a welt shoe, and for sewing the welt of a welt shoe to its outsole, and also in interstate and foreign trade and commerce in such machines, and parts thereof. These companies manufactured at least 10 per cent of all such sewing machines manufactured in the United States. The said International Eppler Welt Machine was owned and controlled by said Eppler Welt Machine Company and its stockholders.

Davey Pegging Machine Company, a corporation of Maine, issued capital stock $200,000, with its principal factory at Boston, Massachusetts, was engaged in the manufacture of machines, and parts thereof, used for attaching the outsole to the insole of boots and shoes by means of wooden pegs or other fastenings, and in interstate and foreign trade and commerce in such machines, and parts thereof. This company manufactured 75 per cent of all such pegging machines manufactured in the United States; and it was owned and controlled by the Consolidated & McKay Lasting Machine Company, hereinbefore mentioned.

Early in 1899 the companies above mentioned and described were manufacturing their machines, and parts thereof, under letters patent of the United States and of other countries. Many of the
1247 basic patents on the principal machines owned and controlled by them were about to expire, and, in the ordinary course of events, the general public would have acquired in the near future the right to the free manufacture and use of such machines, the lawful monopoly of such machines theretofore enjoyed by virtue of the patents would have come to an end, and the system of demanding large royalties for their use would have been replaced by their general manufacture and outright sale under competitive conditions. Furthermore, under the conditions then existing, new patents were being constantly taken out by others, and new and improved machines for performing the principal operations in the manufacture of boots and shoes by the aid and use of machinery were being placed

upon the market, either upon a smaller royalty than had theretofore been charged for machines doing similar work or for sale outright to boot and shoe manufacturers.

IV.

ORGANIZATION OF UNITED SHOE MACHINERY COMPANY, OF NEW JERSEY, ITS PURPOSES AND OPERATIONS.

Defendants Sidney W. Winslow, William Barbour, Elmer P. Howe, John H. Hanan, George E. Keith, Edward P. Hurd, George W. Brown, Wallace F. Robinson, Rudolph Matz, and others, owners, officers, directors, and agents of said Goodyear Shoe Machinery Company, International Goodyear Shoe Machinery Company, Goodyear Shoe Machinery Company, of Canada, Consolidated & McKay
1248 Lasting Machine Company, McKay Shoe Machinery Company, Eppler Welt Machine Company, International Eppler Welt Machine Company, and Davey Pegging Machine Company, not being satisfied with the benefit of the lawful monopolies and rights belonging to them under letters patent of the United States and of other countries, which they had enjoyed for many years, pertaining to shoe machinery, and parts thereof, and designing and intending unduly, unreasonably, and unlawfully to extend, expand, and perpetuate said monopolies and rights and to enhance the value thereof at the expense of the boot and shoe manufacturers and of the public generally, and to use the same as a means for unlawfully controlling interstate and foreign trade and commerce in shoe machinery to a greater extent than was warranted by said letters patent, determined to acquire a complete monopoly of the manufacture, sale, and lease of shoe machinery, destroy existing competition among the manufacturers and dealers in such machinery, and through unlawful combinations and agreements to exclude all others from said trade and commerce. For the accomplishment of this purpose they conceived the idea of acquiring the ownership or control of all concerns engaged in manufacturing and dealing in any and all kinds of shoe machinery, and then to refuse to sell or lease any of the essential machines to the manufacturer of shoes except on condition that he buy or lease of them practically all other machinery
of whatever kind necessary or useful to such manufacturer
1249 of shoes, and thereby to exclude all competition by other manufacturers of such shoe machinery and to monopolize the trade and commerce therein among the States and with foreign countries. The various contracts, combinations, conspiracies, and acts, hereinafter described, were steps in carrying out the above-mentioned unlawful project. A preliminary agreement was made, and

in February, 1899, they incorporated United Shoe Machinery Company, under the laws of New Jersey, with an authorized capital of $25,000,000 ($12,500,000 preferred, $12,500,000 common), with broad powers under its charter to manufacture, buy, sell, lease, operate, and deal in and with all kinds of machinery, tools, and implements, and especially in everything in any way connected with or used in the manufacture of boots and shoes. For the stock allotted to each, and for cash, at values far in excess of real worth, four of the old concerns, to wit, Goodyear Shoe Machinery Company, International Goodyear Shoe Machinery Company, Consolidated & McKay Lasting Machine Company, and McKay Shoe Machinery Company, conveyed to the new corporation, as going concerns, their business of manufacturing, selling, leasing, and dealing in shoe machinery, including their letters patent of the United States and of other countries, and all property and rights used in connection therewith, wherever situated; and their principal owners, managers, di-
1250 rectors, and officers became managers, directors, and officers of the new company. Stock of the new company was allotted and received as follows:

Goodyear Shoe Machinery Company (issued capital, $3,000,000)		$4,800,000
Preferred	$2,400,000	
Common	2,400,000	
International Goodyear Shoe Machinery Company (issued capital, $1,000,000)		$680,000
Preferred	$340,000	
Common	340,000	
Consolidated & McKay Lasting Machine Company (issued capital, $3,000,000)		$4,599,840
Preferred	$2,199,840	
Common	2,400,000	

In addition to the stock acquired from the new company, the holders of preferred stock of said Consolidated & McKay Lasting Machine Company received $1 in cash for each share thereof (total, $24,000), and its holders of common stock received for each share thereof, in addition to stock in the new company, $4.50 in cash (total, $432,000).

McKay Shoe Machinery Company (issued capital, $5,000,000)		$5,500,000
Preferred	$2,750,000	
Common	2,750,000	

1250½ At the time of the organization of the new company a syndicate was formed by the owners, officers, and directors of the

old companies, which subscribed and paid for a certain amount of its common and preferred stock at par, as follows:

50,854.70 shares preferred	$1,271,367.50
44,962.70 shares common	1,124,067.50
	$2,395,435.00

That amount was used to pay the expenses of the organization of the new company, the floating debts of all of the old companies, and for the purchase of the capital stock, property, business, and letters patent of each said Eppler Welt Machine Company, International Eppler Welt Machine Company, and Goodyear Shoe Machinery Company of Canada, and there was left a balance of $500,000 in cash as working capital for the new company.

V.

LEASE AND LICENSE AGREEMENTS, CONTAINING EXCLUSIVE-USE AND TYING PROVISIONS, WHICH DEFENDANTS HAVE DEVISED, ADOPTED, AND USED, AND ARE NOW USING, FOR THE PURPOSE OF DESTROYING COMPETITION.

By the organization of United Shoe Machinery Company, of New Jersey, and the taking over by that company of substantially all of the capital stock and the businesses and assets of each of the old concerns hereinbefore mentioned, defendants acquired control of
1251 the greater portion of the manufacture of, and trade and commerce in, the machines included in each and all of the groups of machines hereinbefore mentioned and described, manufactured, sold, and leased to boot and shoe manufacturers in the United States.

Prior to the organization of United Shoe Machinery Company, of New Jersey, boot and shoe manufacturers, purchasing or leasing machines from one of the aforesaid companies, were not compelled to use exclusively machines mentioned in the aforesaid groups manufactured by either of the other companies. For example, the shoe manufacturer who held lasting machines under lease from the Consolidated & McKay Lasting Machine Company was not required to use, in connection with that company's lasting machines, welt-sewing machines or outsole-stitching machines of the Goodyear Shoe Machinery Company, or those of any other company, and he was free to obtain such machines wherever he could procure them to the best advantage. The same was true of the trade in welt-sewing machines and outsole-stitching machines, heeling machines, and metallic fastening machines. Defendants, however, not being satisfied or contented with said portion of the trade and commerce in shoe machinery which they acquired through the organization of United

Shoe Machinery Company, of New Jersey, and with the intent to acquire complete control of the business of manufacturing and selling or leasing shoe machinery among the States and with foreign
1251½ countries, to exclude all others therefrom, to enhance the cost of said machines to users thereof, and to wrong and to oppress the public, discontinued the sale to boot and shoe manufacturers of each and all of the machines included in said groups of machines, and unlawfully devised, adopted, and put into effect arbitrary, oppressive, and unreasonable lease and license agreements, which boot and shoe manufacturers have been and are required to agree and conform to in order to obtain from said defendants any of the machines included in said groups. These agreements contain provisions, not found in their former lease and license agreements, which compel boot and shoe manufacturers leasing any of such machines from defendants to agree to use exclusively one or more of the classes of machines included in said groups of machines owned and controlled by them, upon penalty of having all the machines included in said groups so leased to them by defendants immediately reclaimed and taken away and the lease and license agreements canceled. These contracts further require boot and shoe manufacturers to take each of said machines for a period of not less than 17 years, regardless of the terms of the patents relating thereto. Lessees thereunder are compelled to obtain all duplicate parts, extras, mechanisms, and devices of every kind needed or used in operating, repairing, or renewing the leased machinery from defendants, at exorbitant prices fixed by them from time to time. Many of
1252 these agreements further provide that the lessee shall, at the expiration of 17 years, and after he has paid large royalties throughout that period, if he shall then have no further use for the machines, return the same to defendants at their factory at Beverly, Mass., and shall pay to them a return charge, which in some cases amounts approximately to the original cost of building the machines. Defendants have continually, persistently, and arbitrarily enforced the provisions of said lease and license agreements by all the means in their power as against the boot and shoe manufacturers, and have made it their general policy and practice to refuse to furnish such machines to any and all boot and shoe manufacturers who fail to comply with the terms or spirit of the provisions of said lease and license agreements, and to otherwise injure them.

Defendants, in pursuance of their general purpose, inserted in, and made a part of, each lease and license agreement, provisions reserving to themselves the right to forthwith terminate and cancel all existing lease and license agreements between them and the boot and shoe manufacturers if the latter should fail or cease to use

exclusively and to their full capacity machines leased or controlled by defendants, thereby prohibiting said manufacturers not only from using competing shoe machinery manufactured in the United States, but also from using any such machinery manufactured in foreign countries and imported here for sale or lease.

1253 Copies of specimen forms of lease and license agreements, containing provisions, as aforesaid, which have been and are now in general use (or others substantially similar thereto) as lease contracts between defendants and boot and shoe manufacturers throughout the United States, are hereto appended, and made a part hereof, in the order following:

Copy of lease and license agreement for "U. S. M. Co. lasting machine No. 5" is "Exhibit 1."

Copy of lease and license agreement for "Consolidated hand-method lasting machines" is "Exhibit 2."

Copy of lease and license agreement for "Chase lasting machines" is "Exhibit 3."

Copy of lease and license agreement for "Boston lasting machine" is "Exhibit 4."

Copy of lease and license agreement for "welt-sewing machines and outsole-stitching machines" is "Exhibit 5."

Copy of lease and license agreement for "Full Set," "Goodyear department machines," is "Exhibit 6."

Copy of lease and license agreement for "Economy insole reinforcing set" is "Exhibit 7."

Copy of lease and license agreement for "Gem insole machinery" is "Exhibit 8."

Copy of lease and license agreement for "heeling machines" is "Exhibit 9."

Copy of lease and license agreement for "metallic fastening machines" is "Exhibit 10."

1254 Copy of lease and license agreement for "Goodyear department," "auxiliary machines" is "Exhibit 11."

Copy of lease and license agreement for "Rex pulling over system" is "Exhibit 12."

Copies of lease and license agreements for "general department" machines are "Exhibits 13, 14, and 15."

Copy of lease and license agreement for "Ensign lacing machines" is "Exhibit 16."

Copy of lease and license agreement for "Duplex eyeletting machine" is "Exhibit 17."

Copy of lease and license agreement for "Power eyeletting machine" is "Exhibit 18."

Copy of lease and license agreement for "Vulcan foot power eyeletting machines" is "Exhibit 19."

Copy of lease and license agreement for "Xpedite finishing machines" and "Xpedite finishing tools" is "Exhibit 20."

Copy of lease and license agreement for "Ideal clicking machines" is "Exhibit 21."

Copy of lease and license agreement for "Davey pegging machines" is "Exhibit 22."

A chart illustrative of the practical effect of the exclusive use and tying provisions, which are too numerous to be here described in full, of the lease and license agreements above referred to, is hereto appended, made a part hereof, and marked "Exhibit 23."

1255

VI.

OTHER UNFAIR AND MONOPOLISTIC ACTS OF DEFENDANTS.

Defendants have not hesitated to use, whenever opportunity offered, the advantages possessed by them in consequence of their acquisition of the properties herein described and the resulting concentration in their hands of the almost entire shoe machinery business. They have by misrepresentation and threats sought to and have induced customers of their competitors to abandon them; they have threatened competitors that they would use their enormous financial resources and the power of their combination to secure to themselves the patronage of such competitors, and by threats have prevented others from entering business in competition with them; they have acquired many letters patent for valuable inventions, and have held the same for long periods of time without making use thereof, thus depriving the manufacturers and the public of the benefits arising therefrom; they have offered and granted, and now are offering and granting, rebates to boot and shoe manufacturers who use exclusively one or more of the machines owned or controlled by them; they have bought the business of many competitors, though compelled to pay exorbitant prices therefor; and they have done many other unlawful acts, too numerous to here set forth in detail; and in all these unfair, oppressive acts, defendants continue to engage at the present time.

1256

VII.

ACQUISITION AND CONTROL OF THE BUSINESSES OF INDIVIDUALS, PARTNERSHIPS, AND CORPORATIONS FORMERLY IN COMPETITION WITH DEFENDANTS.

In pursuance of their purpose to monopolize the shoe machinery industry, defendants have, through United Shoe Machinery Company, of New Jersey, by the methods herein described, absorbed

many competitors and driven others out of business, and have deterred and prevented and are now deterring and preventing others from entering the business, and have thus made competition with themselves practically impossible.

Defendants have taken from all or substantially all of those whose business they have absorbed or purchased covenants in writing (which covenants are too numerous and voluminous to be set forth in full in this petition) not to engage for long terms of years in trade and commerce in shoe machinery in competition with defendants; and have further required the vendors to agree in substance that if they shall invent or cause to be invented or shall patent or cause to be patented, either in the United States or in any foreign country, any machines adapted for use in the manufacture of boots or shoes, or shall acquire interests and rights in, to, or under any invention, improvement, or letters patent which they shall make, own, or acquire, during the period of time stipulated in said covenants, relating to machinery, mechanisms, tools and devices, processes,
1257 methods, or things intended or adapted for use in the manufacture of boots and shoes, they shall assign and transfer to said defendants all such inventions and letters patent and interests and rights therein.

Among the individuals, partnerships, and corporations who were competitors of defendants and whose businesses have been so acquired and absorbed by them are the following:

In March, 1899, defendants, through United Shoe Machinery Company, of New Jersey, for the purpose of destroying competition, acquired control of the business of Goddu Sons Metal Fastening Company, Boston, Mass., a corporation of Maine, engaged in the manufacture, sale, and shipment in interstate and foreign commerce, of machines designed and adapted for use in the manufacture of boots and shoes. The authorized capital stock of this company was $500,000; and defendants, by agreement with Louis Goddu, Louis H. Goddu, George Goddu, William Goddu, Napoleon Goddu, and Eloie Goddu, who held a majority thereof, to wit, 75 per cent, acquired the same for approximately $150,000, by issuing therefor 2,492 shares of the preferred stock, at an agreed value of $30, and 2,130 shares of the common stock, at an agreed value of $35, of United Shoe Machinery Company, of New Jersey, one-half of said stock being held in trust for a period of 10 years by defendant Sidney W. Winslow for the faithful performance of the agreement entered into by the vendors. Having thereby acquired the majority
1258 of stock, and control of the company, defendants have arbitrarily refused to purchase the holdings of some of the largest minority stockholders. The plant has long been closed and the business of the company discontinued.

The vendors, for the same consideration, conveyed to United Shoe Machinery Company, of New Jersey, its successors and assigns, all right, title, and interest in and to any and all inventions which they should thereafter jointly or severally make, own, or acquire within a period of 10 years, and which should in any way relate to shoe machinery or to mechanisms or appliances or devices useful in the manufacture of boots or shoes or to the production or preparation of such machinery, mechanisms, appliances, devices, fastenings, materials, or other things; and the vendors, and each of them, further agreed that they would not thereafter, within 10 years, engage, directly or indirectly, in the business of making or selling any inventions or improvements relating in any way to machinery and mechanisms useful in the manufacture of boots and shoes.

In June, 1899, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, agreed with Marshall Henry Pearson and Charles Bennion, of Leicester, England, who owned and controlled all of the capital stock of Pearson & Bennion (Ltd.), a corporation organized under the laws of Great Britain and Ireland, engaged in the business of
1259 manufacturing machines useful in the manufacture of boots and shoes, and in the importation and interstate commerce in the sale, lease, and shipment of the same, with its principal place of business at Leicester, England, and with offices at Boston, Mass., to form a new corporation to be organized under the laws of Great Britain and Ireland for the purpose of taking over and carrying on the shoe-machinery business theretofore carried on by Pearson & Bennion (Ltd.), and the business in England, Ireland, and Scotland of said United Shoe Machinery Company. Accordingly British United Shoe Machinery Company (Ltd.) was formed with a capital of £450,000 ($2,189,925)—£250,000 ($1,216,625) preferred and £200,000 ($973,300) common. For the business conveyed by them to the new company Pearson and Bennion received in stock £40,000 ($194,660) preferred and £40,000 ($194,660) common and £4,300 ($20,925) cash. Pearson and Bennion agreed to assign, transfer, and convey, for the same consideration to the new corporation all letters patent of Great Britain and of other countries and all inventions and all pending applications for letters patent of Great Britain and of other countries, and to assign, transfer, and convey to the new corporation any and all inventions which they should thereafter make in any way relating to shoe machinery or to the manufacture of boots or shoes, or to materials used in their manufacture. The issued capital stock of said British United Shoe
1260 Machinery Company (Ltd.) is £353,494 ($1,720,278), of which United Shoe Machinery Company, of New Jersey,

owns £206,800 ($1,006,392). Defendants Sidney W. Winslow, William Barbour, George W. Brown, John H. Connor, and Elmer P. Howe are on its board of managers and dictate its policies, and its competition with defendants in the markets of the United States was thus destroyed.

In June, 1899, defendants, in pursuance of their general purpose, acquired for $6,769.40, from Silas Pierce and John M. Kingsbury, a majority of the capital stock of Corrugated Wire Fastening Company, Boston, Mass., a corporation of Connecticut, engaged in the manufacture and sale of corrugated wire for use in the manufacture of boots and shoes. This plant has long been closed.

In July, 1899, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired from Breach Manufacturing Company, Boston, Mass., a corporation of Maine, an exclusive license, under certain letters patent of the United States of America, to manufacture, sell, and lease certain machines for rounding or cutting soles or patterns for boots and shoes, for $10,000 cash, plus 10 per cent of the gross proceeds of sales of said machines in the United States and foreign countries.

In August, 1899, Peter A. Coupal and William Gordon, of Boston, Mass., conveyed to United Shoe Machinery Company, of New
1261 Jersey, certain boot and shoe machinery, tools, and appliances, for a consideration of $10,799.25, receiving in payment therefor common stock of said United Shoe Machinery Company. The vendors thereupon entered the employ of United Shoe Machinery Company, of New Jersey, and each of them agreed that so long as he should remain in the employ of said company all inventions that he should make or acquire should be disclosed and explained to it.

In August, 1899, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired the business of Timothy A. Bresnahan, of Boston, Mass., engaged in the manufacture, sale, lease, and shipment in interstate commerce, of machines, tools, and appliances designed and used in the manufacture of shoes, together with the entire capital stock of Boston Shoe Tool Company, a corporation of Maine, with a capital of $50,000, for approximately $72,000, paid in cash and preferred stock of said United Company. Bresnahan agreed to enter the employ of the Boston Shoe Tool Company as manager for a period of two years. Defendants required and took from the vendor covenants that he would not thereafter engage in, nor directly or indirectly aid, assist, or encourage any other person to engage in, the manufacture of heel-trimming, edge-trimming, or edge-cutting machines and tools, cutters, or irons for heel or edge trimming,
1262 for edge setting, or of any of the machines, tools, and products formerly made by said Boston Shoe Tool Company.

Defendants also required and took from said Bresnahan covenants in part as follows:

"Said Bresnahan, as an officer of said Boston Shoe Tool Company, agrees to use his best efforts to purchase, on terms and at prices approved by said United Company, the business of any persons, firms, or corporations engaged in a like or similar business to that now carried on by said Boston Shoe Tool Company, and the pattern, special tools, parts of machines used by them in the manufacture of cutters, trimmers, and edge-trimming and edge-setting and heel-trimming machines or tools, and the stock of such machines, cutters, trimmers, or tools on hand or in process of construction, together with the good will of such businesses and letters patent, trade-marks, and trade names employed by them in carrying on such businesses."

The plant of Boston Shoe Tool Company has long been closed and its business discontinued.

In October, 1899, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired from Edwin Theophilus Freeman, of Boston, Mass., engaged in interstate trade and commerce, all of his business, including machinery and letters patent of the United States, relating to
1263 nailing machines used in the manufacture of boots and shoes, for the sum of $11,000, $500 in cash and $10,500 in preferred stock of said United Company, and, in addition thereto, $500 per year as royalties for a period of eight years. Defendants required and took from the vendor, for the same consideration, covenants that he would not thereafter engage, directly or indirectly, in the manufacture of shoe machinery, and that he would convey to said United Shoe Machinery Company all improvements or inventions which he should thereafter make, relating to boot or shoe or leather-working machinery, tools, and appliances.

In October, 1899, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired from George W. Freeman, of Boston, Mass., formerly engaged in business with Edwin Theophilus Freeman, whose principal place of business was at Boston, Mass., all of his interests relating to shoe machinery, for a consideration of employment for one year by said United Shoe Machinery Company, of New Jersey, at a compensation of $800 per annum; and, for the same consideration, defendants required and took from said Freeman covenants that he would not thereafter engage, directly or indirectly, in the manufacture of shoe machinery in competition with said United Shoe Machinery Company, or assist or encourage any other person to engage in such competition, and that he would convey to said com-
1264 pany all improvements or inventions relating to boot and

shoe or leather-working machinery which he should thereafter make.

In October, 1899, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired from Albert G. Brewer, of Hopkinton, Mass., all of his inventions and improvements in machines used in the manufacture of boots and shoes and known to the trade as "heel-breasting machines," for $250 in cash, and $5 royalty on each machine thereafter marketed by said United Company. For the same consideration, defendants required and took from said Brewer conveyance of all inventions which he should thereafter make relating to "heel-breasting machines."

In October, 1899, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired the business of James H. Reed, Alfred L. Barrett, Henry M. Loomer, Ward Perkins, and Ralph W. Burnham, copartners, trading under the name of Globe Shoe Tool Company, at Boston, Mass., engaged in the manufacture of edge cutters and irons used in the manufacture of boots and shoes, and in the sale and shipment of the same in interstate trade and commerce. The purchase price was $30,000, which was paid in cash and preferred stock of said United Company. The said Henry M. Loomer and Ward Per-
1265 kins agreed to enter the employ of the vendee at a compensation of $25 per week for a period of one year, and further agreed that they would not thereafter engage, either directly or indirectly, or assist or encourage any other person so to do, in the manufacture of boot and shoe or leather-working machinery in competition with the vendee. For the same consideration, defendants required and took from said Loomer and Perkins covenants that they would convey to vendee all improvements or inventions relating to boot and shoe or leather-working machinery, machines, tools, and appliances which they should thereafter make.

In November, 1899, defendants, through United Shoe Machinery Company, of New Jersey, acquired all of the business of John Ritchie and John Ritchie Company, a corporation, with its principal place of business at Quebec, Dominion of Canada, relating to the manufacture of standard screw machines, slugging machines, tacking machines, and others, designed and used in the manufacture of boots and shoes, paying therefor $15,000. The vendors agreed that they would not engage, directly or indirectly, at any time thereafter in any business in competition with said United Shoe Machinery Company or any of its controlled companies.

In January, 1900, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired, for $38,000, the business and assets, including letters
1266 patent of the United States and of other countries, of the

Seaver Process Lasting Company, Boston, Mass., a corporation of Maine, engaged in the manufacture of machines designed and used for the purpose of lasting the uppers of boots and shoes, and in interstate and foreign trade and commerce in the sale and lease of such machines.

In February, 1900, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired from Frank N. Stackpole, George D. Pike, Joseph H. Ordway, and John R. Stuart, jr., copartnership doing business under the name of Boston Blacking Company, at Boston, Mass., substantially a one-half interest in the business of said concern, which was engaged in manufacturing blacking, cement, stains, and other products for dressing or preparing the leather of boots and shoes and other articles, and in selling and shipping the same to various States of the United States and to foreign countries. The purchase price was $280,000, which was paid in preferred stock of said United Shoe Machinery Company. By agreement between the vendors and the vendee, a corporation, Boston Blacking Company, was formed under the laws of Maine, with an issued capital stock of $600,000 (6,000 shares, par value $100 each), which took over the partnership business. The vendors received 3,004 shares of the capital stock of the new corporation, and each of them entered its employ at a
1267 salary of $6,000 per annum. The vendors, and each of them, agreed not to engage or become interested in any way in any competing concern within a period of 15 years in that portion of the United States east of the Mississippi or Missouri Rivers, or any portion of Missouri, Louisiana, Nebraska, Kansas, or California, or any portion of Canada to the eastward of the Albany River, Lake Nipigon, and Lake Superior, or any portion of Europe except in Spain, Portugal, Turkey, Greece, Servia, and Bulgaria. Defendant, United Shoe Machinery Company, of New Jersey, now owns 2,996 shares ($299,600) of the capital stock of said Boston Blacking Company, and by agreement the holders of the majority stock are required to vote that stock in favor of four of the directors who shall be representatives of United Shoe Machinery Company, of New Jersey; defendants Edward P. Hurd, Sidney W. Winslow, and George W. Brown are on its board of directors.

In March, 1900, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired from Erastus E. Winkley and Benjamin Phillips, Lynn, Mass., their inventions and improvements relating to machines known to the trade as "sole-leveling machines," the said United Shoe Machinery Company to pay to the vendors a royalty of $20 for each machine made and sold, leased, or otherwise disposed of. The vendors, for

the same consideration, agreed to convey to defendants all in-
1268 ventions or improvements in sole-leveling machines which they should thereafter make or acquire.

In March, 1900, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired the foreign trade and business of Stanley Manufacturing Company, a corporation of Maine, with its principal place of business at Lawrence, Mass., engaged in the manufacture of machines known to the trade as "McKay sewing machines," used in the manufacture of boots and shoes, and in interstate and foreign trade and commerce in the shipment, sale, and lease of the same, paying therefor $86,500 in preferred stock of said United Shoe Machinery Company. The vendors agreed to withdraw from Germany and not thereafter to engage in that country in the shoe-machinery business, and that they would not thereafter export or sell or dispose of to others for export any boot or shoe machinery, or supplies therefor, outside of the United States, except through said United Shoe Machinery Company.

In April, 1900, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired the business of Lincoln Sewing Machine Company, Boston, Mass., a corporation of New Hampshire, engaged in the manufacture, sale, lease, and shipment in interstate commerce of sewing machines de-
signed and used for the manufacture of boots and shoes. The
1269 consideration was $33,075, of which $2,450 was paid in cash and $30,625 in common stock of said United Shoe Machinery Company.

In June, 1900, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, by agreement with Theophilus King, Henry Tolman, and Eleazer Kempshall, owners of the majority stock of Boston Fast Color Eyelet Company, Boston, Mass., a corporation of Maine, engaged in the manufacture, sale, and shipment in interstate commerce of eyelets covered with celluloid, formed a new company, United Fast Color Eyelet Company, under the laws of Maine, with a capital of $1,500,000; and the entire business and assets of Boston Fast Color Eyelet Company were transferred to this company, and the said King, Tolman, and Kempshall received $155,000 of preferred stock of the new company, and said United Shoe Machinery Company $1,000,000 of common and $145,000 of preferred stock of the new company; and the vendee also agreed to pay the said King $35,000 in cash. The vendors and each of them agreed for the same consideration that all inventions and letters patent of the United States and of foreign countries which they should acquire within 15 years thereafter relating to covered eyelets, or to any machinery, plant, processes, or products

used or intended to be used in the manufacture thereof, should be assigned and conveyed to the new corporation, and that neither
1270 of them would jointly or severally enter the employ or become interested in the business of any person, firm, partnership, or corporation the business of which would be hostile to the development and prosperity of the business of the new company. $1,478,600 of the capital stock of the new company has been issued, of which said United Shoe Machinery Company owns $1,020,600. Defendant Sidney W. Winslow always has been its president, and its business and affairs are conducted without competition with any of the defendants. The company is engaged in interstate and foreign trade and commerce.

In June, 1900, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired from Theophilus King, Henry Tolman, and Eleazer Kempshall 60,000 shares, being a majority thereof, of the capital stock of Enamel Eyelet Company, Boston, Mass., a corporation of Maine, engaged in the manufacture, sale, and shipment in interstate commerce of eyelets for boots and shoes, for $75,000 in preferred stock of United Fast Color Eyelet Company. Defendants also required and took from the vendors an assignment of all inventions, letters patent, and applications for letters patent of the United States and of foreign countries in any way relating to enamel eyelets or the manufacture thereof which they then owned or controlled or
1271 which they should make or acquire or control or obtain any interest in within 15 years from the date of said agreement. The vendors and each of them also agreed that they would not, for a period of 15 years, engage in any business in competition with defendants.

In September, 1900, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired from Simon Ross and W. F. Harmon all of the issued capital stock and business of Ross-Moyer Manufacturing Company, Cincinnati, Ohio, a corporation of Ohio, with an issued capital of $197,400, engaged in the manufacture, sale, and shipment in interstate commerce of edge setters, edge trimmers, heel scourers, and other machines used in the manufacture of boots and shoes, paying therefor one and eight-tenths shares of preferred stock of United Shoe Machinery Company, of New Jersey, for each share of the capital stock of Ross-Moyer Manufacturing Company, aggregating $88,830. The business has been continued, but under the direction and control of and without competition with defendants. Defendant Sidney W. Winslow has been its president since the company was acquired. All of the issued capital stock is owned by said United Shoe Machinery Company.

About January, 1901, defendants, in pursuance of their general purpose, acquired for United Shoe Machinery Company de
1272 France and for Deutsche Vereinigte Schuhmaschinen Gesellschaft G. m. b. H., the property and good will for the Continent of Europe of the Bay State International Shoe Machinery Company, Boston, Mass., paying therefor approximately $25,000 in preferred stock of United Shoe Machinery Company, of New Jersey.

In February, 1901, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired the business and assets, including letters patent, of Swain Fuller Manufacturing Company, Boston, Mass., a corporation of Maine, engaged in the manufacture, sale, lease, and shipment in interstate commerce of machines used in the manufacture of boots and shoes, paying therefor $13,201.92, of which $2,576.92 was paid in cash and the balance, $10,625, in preferred stock of said United Shoe Machinery Company. The plant has long been closed.

In February, 1901, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired control of $599,210 of the issued capital stock, $1,000,000, of Globe Sewing Machine Company, Boston, Mass., a corporation of Maine, engaged in the manufacture, sale, lease, and shipment in interstate commerce of sewing machines designed and used for the manufacture of boots and shoes, paying therefor $20,000 in preferred stock of said United Shoe Machinery Company. The plant has long been closed.

1273 About May, 1901, defendants, in pursuance of their general purpose, acquired for approximately $45,000 the property and business (not theretofore acquired) of Boot & Shoe Sole Laying Company, Boston, Mass., a corporation of Maine, engaged in the manufacture, sale, and shipment in interstate and foreign commerce of machines designed and used for laying the soles of boots and shoes. The business of the company, as a going concern, has been discontinued.

In June, 1901, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired all the business, assets, property, real estate, machinery, and devices, including all letters patent of the United States and of foreign countries, of John C. Rhodes and John B. Rhodes, trading under the name of J. C. Rhodes & Company, New Bedford, Mass., engaged in the manufacture, sale, and shipment, in interstate and foreign commerce of eyelets used in the manufacture of boots and shoes, paying therefor $775,000, $200,000 in cash and $575,000 in preferred stock of said United Shoe Machinery Company. The vendors agreed that they would not, for a period of 15 years, engage in, except as employees of defendants, either as proprietor, manager, manufac-

turer, partner, employee, or stockholder of any corporation, or be connected with, directly or indirectly, the business of manufacturing or selling eyelets of any description, or any substitute therefor, or any machinery for making eyelets. Defendants required
1274 and took from the vendors covenants to convey to the vendee all inventions and improvements relating to the manufacture of eyelets which they should make, own, or acquire within 15 years. Defendants then caused to be organized J. C. Rhodes & Company (Inc.), under the laws of Maine, with a capital of $600,000, which took over the partnership business and which has since been conducted without competition with any of defendants. All of the capital stock is owned or controlled by said United Shoe Machinery Company. Defendant Sidney W. Winslow is its president.

In December, 1901, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired for $31,000 the eyelet business of Morley Button Manufacturing Company, Portsmouth, N. H., a Maine corporation, engaged in the manufacture, sale, and shipment in interstate commerce of eyelets used in the manufacture of shoes. For the same consideration, defendants required and took from the vendors covenants not to engage thereafter, directly or indirectly, during the terms of the patents conveyed, in the manufacture or sale of eyelets in competition with them, nor to encourage, aid, or assist others to engage in such competition, either in the United States or in any foreign country.

In February, 1902, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jer-
1275 sey, acquired from Oliver A. Miller, Brockton, Mass., engaged in the manufacture of "treeing machines," and in interstate and foreign trade and commerce in the sale and shipment of the same, all of his business and assets, including letters patent of the United States and of foreign countries, for $160,000 in cash. Defendants required and took from the vendor covenants that he would not, at any time within 15 years, engage, directly or indirectly, in the business of manufacturing or dealing in boot or shoe treeing machines, or tree legs, tree feet, or any parts thereof, in competition with defendants. Thereupon defendants caused to be organized, under the laws of Maine, O. A. Miller Treeing Machine Company, with an authorized capital of $500,000, of which $200,000 has been issued, which took over the business formerly conducted by O. A. Miller. United Shoe Machinery Company, of New Jersey, owns and controls all of the issued capital stock except $20,000. It is engaged in interstate and foreign trade and commerce, but is not competing with any of defendants. Defendant Sidney W. Winslow is its president.

In June, 1902, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired the business and assets of Marlboro Awl & Needle Company, Marlboro, Mass., engaged in the manufacture, sale, and shipment in interstate and foreign commerce, of awls and needles used in the
1276 manufacture of boots and shoes, the vendors agreeing to take stock, in payment therefor, in a new corporation to be formed by defendants. Defendants thereupon caused United Awl & Needle Company, with an authorized capital of $200,000, to be organized under the laws of Maine, which took over the business of the old concern. $56,100 of the capital stock has been issued, of which said United Shoe Machinery Company owns $34,900. It operates a factory at West Medway, Mass., and is engaged in interstate and foreign trade and commerce, but is not competing with any of the defendants in the sale and shipment of its products. Defendant Sidney W. Winslow is its president.

In September, 1902, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired for $5,200 from Arthur Fuller all the property and assets, including letters patent of the United States and of other countries, of American Sole-Laying Machine Company, Boston, Mass., a corporation of Maine, engaged in the manufacture, sale, lease, and shipment in interstate commerce of machines designed and used for laying or leveling the soles of boots and shoes. Defendants required and took from the vendor covenants that he would not become interested, directly or indirectly, for a period of 10 years in the business of manufacturing machines adapted for use in the operation of laying or leveling the soles of boots and shoes. The plant has long been closed.

1277 In October, 1902, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired for $14,000 the foreign business (except Canada) of William J. Young, Lynn, Mass., engaged in the manufacture, sale, lease, and shipment in interstate commerce of machines designed and used for preparing the heels for boots and shoes. Defendants required and took from the vendor covenants that he would not engage, directly or indirectly, in competition with said United Company for a period of 15 years in any country other than the United States and the Dominion of Canada; that he would convey, for the same consideration, to said United Company all inventions and improvements that he should make or acquire within a period of 15 years relating or pertaining in any way to machinery or devices intended or adapted for use in the manufacture or preparation of heels.

In November, 1902, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired from George A. Smith, of Philadelphia, Pa., all of the capital stock, property, assets, and business of the George A. Smith Machinery Company, Philadelphia, Pa., a corporation of New Jersey, engaged in the manufacture, sale, lease, and shipment in interstate commerce of machinery, appliances, and supplies used by manufacturers of boots and shoes. The purchase price was to be
1278 determined upon an inventory of the property of the Smith Company. Defendants required and took from the vendor covenants that he would not at any time within 10 years, within the United States or in any other country, directly or indirectly, enter into or be engaged in, or financially or otherwise assist any other person, firm or corporation in entering into or developing or carrying on any business relating to the manufacture, sale, or lease of any machinery, devices, or appliances intended or adapted for use in the manufacture of boots and shoes, or compete or interfere with any business carried on by said United Company or by any company in which it is the owner of the majority of the capital stock.

In December, 1902, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired for $41,500 the business of George A. Emerson and William R. Sampson, copartners, trading under the name of George W. Emerson & Company, at Lynn, Mass., engaged in the manufacture, sale, and shipment in interstate commerce, of machinery, appliances, devices, and supplies designed and used in the manufacture of boots and shoes. For the same consideration, defendants required and took from the vendors, and each of them, covenants that they would not engage, directly or indirectly, in competition with the vendee for a period of 15 years, and that all inventions or improvements which said vendors, or either of them, should make, own or
1279 acquire relating to machinery, appliances, devices, or supplies adapted for use in the manufacture of boots and shoes, at any time within said period of time, should be forthwith disclosed to said United Company, its officers and patent solicitors. The business has been discontinued.

In March, 1903, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired control of the business of the T. A. Norris Machine Company, Brockton, Mass., a corporation of Massachusetts, with an issued capital stock of $20,000, engaged in the manufacture, sale, and shipment in interstate commerce, of machines used in the manufacture of boots and shoes. The plant has been closed.

In February, 1903, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey,

acquired from William B. Cross, for $50,000, the majority of the capital stock of W. W. Cross & Company (Inc.), Brockton, Mass., a corporation of Maine, engaged in the manufacture, sale, and shipment in interstate commerce, of nails, tacks, and other supplies used in the manufacture of boots and shoes.

In May, 1903, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired, for approximately $100,000, the property and assets of
1280 the John K. Krieg estate, Hermine L. Krieg, Lewis G. Metzger, Charles O. Kuhnert, Lemuel R. Mears, and Carl H. Krieg, copartners doing business under the firm name of J. K. Krieg & Company, New York, N. Y., engaged in the manufacture, sale, and shipment in interstate commerce, of machines designed and used in the manufacture of boots and shoes; and also in the manufacture of goods, supplies, and equipment for retail shoe stores and for cobblers. Defendants required and took from the vendors covenants that they would not engage, directly or indirectly, for a period of 15 years, except as employees of said United Shoe Machinery Company, or some one of its controlled corporations, in any business relating or pertaining in any way to the manufacture of or dealing in shoe machinery or shoe manufacturers' goods, findings, supplies, or equipment, or in any business which would in any way interfere with or compete with defendants, except in selling supplies to retail shoe stores and cobblers, all such supplies to be purchased from defendants.

In October, 1903, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired from Joseph P. Curtis, Everett, Mass., all of his business, including letters patent and applications for letters patent, relating to cementing machines used in the manufacture of boots and shoes;
consideration, $5,000, to be paid in royalties on machines there-
1281 after manufactured by said United Company. Defendants required and took from the vendor, for the same consideration, conveyances of all inventions and improvements which he should at any time thereafter make relating to cementing machines, either as sole inventor or as joint inventor with others, and all right, title, and interest in, to, and under all inventions and improvements in cementing machines which he may in any way own or control or which he may have any right, by agreement or otherwise, to acquire or take over, and all letters patent and interests therein.

In January, 1904, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, employed one Fred H. Perry, of West Medford, Mass., as inventor for a period of one year at $30 per week. For the same consideration, defendants required and took from said Perry covenants that

he would convey to said United Shoe Machinery Company all inventions and improvements which he should make, own, or acquire, relating to machinery useful in the manufacture of boots and shoes, at any time within five years after the termination of his employment by said United Company.

In January, 1904, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired for $3,052 from Joseph W. Leary, of Lynn, Mass., his
1282 interstate business of manufacturing and dealing in shoe machinery, devices, and supplies, cements, blackings, and stains. The vendor agreed to enter the employ of said United Company for a period of five years with compensation at $40 per week, and for the same consideration agreed to convey to the vendee and its successors all inventions and improvements which the vendor should make or acquire within 10 years from the date of the termination of such employment by said United Company, and that within the same period he would not engage, directly or indirectly, in any business which competed or interfered with said United Shoe Machinery Company or any of its affiliated companies.

In January, 1904, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired for $25,915 the business, together with all letters patent of the United States and of foreign countries, of F. G. Farnham Brush Manufacturing Company, Honesdale, Pa., a corporation of New Jersey, engaged in the manufacture and in interstate and foreign trade and commerce in the sale of brushes, sleeves, collars, hubs, fillers, bristles, fiber, and other parts used for finishing boots and shoes. The vendors agreed that they would not engage, directly or indirectly, or in any way assist in any competition, in any country, or financially assist any other person or corporation to compete with said United Shoe Machinery Company or its successors for a
1283 period of 15 years, and for the same consideration defendants required and took from the vendors covenants that they would convey to defendants all inventions and improvements and all letters patent and applications therefor of the United States and of foreign countries which they should make or acquire at any time within said period of time relating or pertaining in any way to brushes, fillers, hubs, sleeves, collars, bristles, and fiber used in the manufacture or finishing of boots and shoes.

In May, 1904, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired from American Glue Company, Boston, Mass., a corporation of New Jersey, the exclusive agency for the United States and Canada for the sale of all sandpaper made for or by said American Glue Com-

pany for use in the manufacture of boots and shoes. Defendants in February, 1901, had acquired a similar agency for Europe.

In June, 1904, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, and United Shoe Machinery Company, of Maine, acquired the business of Zachary Taylor French, of Boston, Mass., engaged in the development of machines designed and used for the manufacture of boots and shoes, paying therefor $15,000 in annual installments of $1,500 each. Defendants required and took from the vendor cov-
1284 enants that he would assign to said United Shoe Machinery Company, for the same consideration, all inventions and improvements which he should, directly or indirectly, make or acquire within 10 years relating to machinery useful in the manufacture of boots and shoes, and that he would not engage in competition with defendants, for the same period, in the United States or any foreign country.

In June, 1904, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired for $4,750 cash, the business of Herbert L. Kimball and Irving A. Hadley, copartners, doing business under the firm name of Kimball & Hadley, at Lynn, Mass., engaged in the manufacture, sale, and shipment in interstate commerce, of needles, awls, drivers, supplies, etc., used in the manufacture of boots and shoes. Defendants, for the same consideration, required and took from the vendors covenants that neither of them would, directly or indirectly, within a period of 15 years, enter into or become interested in, or financially or otherwise assist any person, firm, or corporation in entering into, developing, or carrying on any business which should consist in whole or in part of or relate to manufacturing or dealing in needles, awls, or drivers. The business has been discontinued.

In June, 1904, defendants in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey,
1285 acquired the business and assets of William B. Arnold and of Arnold Machine & Supply Company, North Abington, Mass., a corporation of Maine, engaged in the manufacture, sale, and shipment in interstate commerce, of cementing machines and devices used in the manufacture of boots and shoes, for $500 cash and royalties on each machine thereafter manufactured by said United Company during the life of the patents transferred. For the same consideration defendants required and took from the said Arnold covenants that he would not, at any time within 15 years, directly or indirectly, enter into or be engaged in, or financially or otherwise assist any person, firm, or corporation in entering into, developing, or carrying on any business consisting in whole or in part of or relating to the manufacture or dealing in cementing machines or devices, or de-

veloping or exploiting any invention relating to such machinery or devices; and, for the same consideration defendants required and took from said Arnold covenants to convey to said United Shoe Machinery Company and its successors all inventions and improvements which he should make, acquire, or take over thereafter, within 15 years, relating to any such machinery or devices.

In October, 1904, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired from Irving E. Booth and Quentin W. Booth, copartners,
doing business under the firm name of Booth Brothers, at
1286 Rochester, N. Y., an assignment of their business in the United
States and Canada relating to perforating machines, for $2,400 in cash and a royalty of $15 to be paid for each machine sold by defendants in the United States and $10 for each machine sold by them in Canada, the said royalties to continue until they should aggregate $7,600, whereupon all interest of the vendors in the said inventions should cease. The vendors agreed that neither of them would engage in the manufacture or sale of any perforating machines or become interested in any manner whatsoever in any such machines during the terms of the patents assigned to defendants.

In October, 1904, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired from Leopold J. Courteau, of Brockton, Mass., an assignment of all his inventions and devices, including all letters patent relating to machines and mechanisms for holding the linings of shoes during the process of pasting the outer leather to the lining. The consideration therefor was 10 per cent of the net selling price of each machine or the payment of $1,000 in cash. For the same consideration, defendants required and took from the vendor covenants that he would convey to defendants all inventions, improvements, or letters patent of the United States and of any and all foreign countries, and any and all right, title, or interest in such inventions,
1287 improvements, and letters patent which he should at any
time thereafter within 15 years own or possess, or in which he should have any interest whatsoever relating to mechanisms or devices for handling or holding the linings of shoes.

In November, 1905, defendants, in pursuance of their general purpose, acquired for $21,724 the business of Oscar A. Campbell and Samuel H. Nichols, copartners trading under the name of Brockton Supply Company, at Brockton, Mass., engaged in the manufacture, sale, and shipment in interstate commerce, of machines for pulling lasting tacks.

In January, 1906, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired control of the Business of The Smith Lacing Machine

Company, Boston, Mass., a corporation of Maine, engaged in the manufacture, sale, and shipment in interstate commerce of machines designed and used for lacing the uppers of boots and shoes prior to lasting, paying therefor $117,500, of which $50,000 was paid in cash and the balance was to be paid in royalties on machines thereafter manufactured and sold by defendants in the United States and in foreign countries. The vendors agreed to transact no further business and to liquidate the affairs of the corporation.

In January, 1906, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired control of the business of Metallic Heel & Counter
1288 Company, Boston, Mass., a corporation of Maine, engaged in the manufacture, sale, and shipment in interstate and foreign commerce, of metallic heels and counters. The purchase price was $119,820, of which $52,320 was paid in cash and the balance was to be paid in royalties on machines thereafter manufactured and sold in this and in foreign countries. The vendors agreed to transact no further business and to liquidate the affairs of the corporation.

In September, 1906, defendants, in pursuance of their general purpose, through United-Xpedite Finishing Company, a corporation of Maine, acquired, for $12,500 cash, from Zotique Beaudry, Lynn, Mass., his inventions and improvements relating to machines and parts thereof for burnishing and finishing the heels of boots and shoes. For the same consideration, defendants required and took from the vendor covenants that all inventions, improvements, and letters patent and interests or rights therein, relating to heel-burnishing machinery, methods, and devices which he should thereafter make, own, or acquire or obtain any interest in should be disclosed to defendants, and that the vendor would not within a period of 15 years engage, directly or indirectly, in making, developing, or exploiting any improvements in heel-burnishing machinery, methods, or devices, or entering into, developing or carrying on any business which should consist in whole or in part of manufacturing, or in any way
1289 dealing in machinery or mechanisms for finishing or burnishing the heels of boots and shoes.

In November, 1907, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired, for $71,284, the entire business of Irving E. Booth and Quentin W. Booth, operating under the trade name of "Booth Brothers," Rochester, N. Y., engaged in the manufacture, sale, and shipment in interstate and foreign commerce, of machinery, tools, mechanisms, devices, findings, materials, and supplies used in the manufacture of boots and shoes. Defendants required and took from the vendors covenants that neither of them would directly or in-

directly engage or become interested in the manufacture or sale of machinery relating to the manufacture of boots or shoes, within 15 years, and that they would not, directly or indirectly, financially or otherwise, encourage or assist, or in any way influence or advise any other person, firm, or corporation to engage in any such business in competition with defendants. By agreement, a corporation, Booth Brothers Company, was formed under the laws of New York, with an authorized capital of $25,000 (all of which is owned by United Shoe Machinery Company, of New Jersey), which took over the business of the old concern. Defendants control the election of its officers and directors, and its business is carried on without competition with any of them. Defendant Sidney W. Winslow is its
1290 president. It operates a manufacturing plant at Rochester, N. Y., and is engaged in interstate and foreign trade and commerce in shoe machinery.

In December, 1908, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired, for $80,000, from William B. Rice, Harry L. Rice, and John H. Richardson all the property and business of Richardson Shoe Machinery Company, Lynn, Mass., a corporation of Maine, engaged in the manufacture, sale, and shipment in interstate commerce, of machines known to the trade as "McKay sewing machines," and machines designed and used for cutting or dieing out leather and other materials used in the manufacture of boots and shoes, including machines known to the trade as "clicking machines." The vendors and each of them agreed that they would not, for a period of 10 years, either directly or indirectly, enter into or become interested in, or financially or otherwise assist any other person, firm or corporation in entering into, engaging in, developing, or carrying on the manufacturing of or dealing in any machinery which shall, directly or indirectly, interfere or compete with the business carried on by defendants; and they further agreed that they would convey, for the same consideration, to said United Shoe Machinery Company all inventions, improvements, letters patent, and interests and rights therein which they should make,
1291 acquire, own, or have any right to acquire or take over relating to any such machinery within said period of time. The plant has been closed.

In December, 1908, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, entered into an agreement with John H. Richardson, referred to above in connection with the acquisition of the business of Richardson Shoe Machinery Company, for his employment by said United Shoe Machinery Company, for a period of one year, at an annual

salary of $2,500. For the same consideration, defendants required and took from said Richardson covenants that he would not, within a period of 10 years after the expiration of such employment, engage, directly or indirectly, in competition with defendants in the business of dealing in any machinery, mechanisms, tools, or devices designed or adapted for use in the manufacture of boots or shoes or in the manipulation or working of leather; and that he would convey to defendants all inventions and improvements which he should make or acquire, relating in any way to machinery used in the manufacture of boots and shoes, and all letters patent, both of the United States and of any and all other countries, covering the same, within 10 years after the termination of his employment by said United Shoe Machinery Company.

In April, 1908, defendants, in pursuance of their general
1292 purpose, through United Shoe Machinery Company, of New Jersey, acquired, for $16,883 cash, from Edward Hobart, control of the shoe-machinery business of Carver Cotton Gin Company, East Bridgewater, Mass., a corporation of Massachusetts, engaged in the manufacture and in interstate and foreign trade and commerce in the sale and shipment, of machines, mechanisms, tools, and devices used in the manufacture of boots and shoes. For the same consideration, defendants required and took from the vendors covenants that neither of them would at any time within 15 years, directly or indirectly, engage in or financially or otherwise assist any other person, firm, or corporation in entering into, developing, or carrying on any business relating in whole or in part to manufacturing, selling, or otherwise dealing in any machinery, tools, mechanisms, or devices used in the manufacture of boots and shoes, or in any other business which would in any way interfere or compete with defendants.

In January, 1909, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired, for $11,500 cash, from Harry L. Rice and Fred La Chappelle, Lynn, Mass., their inventions and improvements relating to machinery, mechanisms, and devices for forming chain stitches and chain-stitch seams, and machines, mechanisms, and devices
1293 used for attaching the welts of boots and shoes. Defendants required and took from the vendors covenants that they would convey for the same consideration to said United Shoe Machinery Company all inventions, improvements, letters patent, and interests and rights therein which they, or either of them, should at any time within 10 years make, acquire, own, or have any right, by agreement or otherwise, to acquire or take over, relating to any methods, machinery, mechanisms, tools, or devices intended for use in the manu-

facture of boots and shoes, and that neither of them would, directly or indirectly, engage in any business which would interfere or compete with the business of defendants.

In February, 1910, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired, for $125,000 cash, from W. Eugene Ellis and Everett D. Chadwick all of the capital stock and business of Ellis Lacer Company, Haverhill, Mass., a corporation of Maine, engaged in the manufacture and in interstate trade and commerce in the sale and shipment of machinery and mechanisms designed and used for temporarily securing the tops of lace shoes while the same are being lasted, the said device being known to the trade as the "Ellis Lacer." Defendants required and took from the vendors covenants that they would not, directly or indirectly, engage in any business in competition with defendants, and that they would convey to defend-
1294 ants, without additional consideration, all inventions and letters patent of the United States and of all other countries which they or either of them might make or acquire at any time within five years.

In February, 1910, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired, for $60,000 cash, from Alexander H. Lewis, Alfred J. Becht, Morris McGrew, Samuel J. Wentworth, Pearl J. Wentworth, Jesse S. Wentworth, and Bayard L. Kilgour all of the capital stock and business of The Wentworth Company, Cincinnati, Ohio, a corporation of Ohio, engaged in the manufacture and in interstate and foreign trade and commerce in the sale and shipment of machines used in the manufacture of boots and shoes. Defendants required and took from the vendors covenants, in substance, that neither of them would, directly or indirectly, at any time within 10 years, engage in the business of manufacturing, developing, or exploiting any machinery or devices that would in any way compete or interfere with the business of said United Shoe Machinery Company.

In February, 1910, defendants, in pursuance of their general purpose, acquired, for $52,185, from B. F. Sturtevant Company, Boston, Mass., a corporation of Massachusetts, its business of manufacturing and dealing in peg wood and wood shanks used in the manufacture of boots and shoes.

1295 In September, 1910, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired the business of Thomas G. Plant, who was engaged in the manufacture of machines designed and adapted for use in performing all the principal operations in the manufacture of boots and shoes which can be performed by the aid and use of machinery.

For at least two years immediately preceding September, 1910, said Plant had invented, and had taken out letters patent of the United States and of foreign countries covering the same, machines designed and adapted for performing all the principal operations in the manufacture of boots and shoes. Among such machines, which are too numerous to be referred to specifically in this petition, were lasting machines, welt-sewing machines, and outsole-stitching machines, heeling machines, metallic-fastening machines, and many others. On or about May 1, 1910, the said Plant installed in the shoe factory of Thomas G. Plant Company, a corporation of New Jersey, issued capital $3,750,000, with its factory and principal offices at Boston, Mass., with a daily capacity of 17,000 pairs of shoes, a complete set of the machines so owned and controlled by him, the said Plant being the owner or in control of a majority of the capital stock of the Plant Company. For several years prior to the installation and use in the factory of the Plant Company of the machines
owned and controlled by Thomas G. Plant, defendants,
1296 through United Shoe Machinery Company, of New Jersey,
or some one or more of the corporations owned and controlled by them, had furnished and supplied all of the principal machines used in the factory of the Plant Company in the manufacture of boots and shoes. Upon the installation in said factory of the machines owned and controlled by Plant, the officials of that company caused the machines owned and controlled by defendants to be dismantled and removed and discontinued the payment of royalties on the same.

Thereupon defendants instituted proceedings against Thomas G. Plant Company in the Supreme Judicial Court of Massachusetts, in which United Shoe Machinery Company, of New Jersey, was the party plaintiff, to enjoin the Plant Company from using the machines which had been supplied to it by Thomas G. Plant; to enjoin said Plant from supplying or furnishing to the Plant Company other machines to be used in the place of machines owned and controlled by defendants, and to recover rents and royalties on defendants' machines during the period that Plant's machines had been used in the factory of the Plant Company. This proceeding was never prosecuted to a final determination for the reasons hereinafter stated.

Thomas G. Plant had advertised extensively, through the public press and otherwise, for several months prior to September, 1910, the
machines which he had invented for use in the manufacture of
1297 boots and shoes, and had solicited among shoe manufacturers,
in various parts of the United States orders for the sale and lease of such machines. Plant, however, experienced difficulty in obtaining orders for his machines on account of the arbitrary, op-

pressive, unreasonable, and unlawful lease and license agreements, containing exclusive use and tying provisions, hereinbefore mentioned and described, which defendants had theretofore required boot and shoe manufacturers to sign, in order to obtain machines from defendants, and under which such manufacturers then held all of the essential machines necessary in the manufacture of boots and shoes. However, a concerted effort was made by a number of prominent boot and shoe manufacturers engaged in business in various States of the United States to acquire the inventions and machines owned and controlled by Plant, or an interest therein. Among such boot and shoe manufacturers who were so interested were Roberts, Johnson & Rand Shoe Company, St. Louis, Mo.; Hamilton-Brown Shoe Company, St. Louis, Mo.; Peters Shoe Company, St. Louis, Mo.; Brown Shoe Company, St. Louis, Mo.; Florsheim Shoe Company, Chicago, Ill.; Selz, Schwab & Company, Chicago, Ill., and Commonwealth Shoe & Leather Company, Boston, Mass.

Representatives of the above companies on September 22, 1910, were in Boston, Mass., in conference with Thomas G. Plant with a view to either purchasing an interest in his inventions and
1298 machines or to make some arrangement which would enable them to obtain machines for use in their factories, and thereby be relieved from the domination and control of defendants. Defendants, being advised of the purpose and intent of said boot and shoe manufacturers, and well knowing that if any arrangement were made between them and Thomas G. Plant whereby they could obtain for use in their factories machines not owned and controlled by defendants, such action would result in defendants' machines being dismantled and removed, as had been done in the factory of the Plant Company, and that competition would be created in the sale, lease, and use of such machines, defendants, for the purpose of preventing such competition and to monopolize trade and commerce in shoe machinery, on or about September 23, 1910, entered into agreements with said Plant whereby they acquired all the inventions, letters patent of the United States and of all foreign countries, relating thereto, together with all machinery, mechanisms, tools, and devices owned and controlled by said Plant, designed and adapted for use in the manufacture of boots and shoes; and defendants acquired also the holdings of the capital stock, which constituted a majority thereof, which the said Plant owned and controlled in said Thomas G. Plant Company. The issued capital stock of said Thomas G. Plant Company is $3,750,000, of which defendants acquired $2,250,000. For the inventions, improvements, letters patent of the United
1299 States and foreign countries, machines, machinery, mechanisms, and devices designed and used in the manufacture of boots an dshoes, including the $2,250,000 of capital stock of said

Thomas G. Plant Company, defendants paid Thomas G. Plant $6,000,000, part in cash and part in stock of defendant corporations.

For the purpose of maintaining their monopoly, defendants required and took from said Plant covenants, in substance, that he should assign, transfer, set over, and deliver to defendants all inventions, improvements, letters patent of the United States and of foreign countries, applications for letters patent, and interest and rights therein, which he might make, own, or acquire, within 15 years thereafter, relating to the manufacture of boots and shoes, or to machinery, mechanisms, tools, or devices, processes, methods, or things intended or adapted for use in the manufacture of footwear, or in the working or manipulation of leather, or relating to eyelets or footwear findings of any description whatsoever, or to the manufacture thereof, together with any and all rights which the said Plant might, within said period, by agreement or otherwise, acquire or take over, covering any such inventions, improvements, letters patent of the United States and of other countries, applications for letters patent, and interest and rights therein.

In November, 1910, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey,
acquired from Adam H. Prenzel, of Halifax, Pa., all of his
1300 inventions and letters patent of the United States and of
all other countries relating to certain machines used in the manufacture of turned shoes, for $8,000 cash, and 25 per cent of all royalties on machines manufactured by defendants under the letters patent acquired from the vendor, until they shall have aggregated $75,000, although there was no obligation on the part of the vendee to manufacture any machines. Defendants required and took from the vendor, for the same consideration, covenants that he would convey to them all inventions, improvements, and letters patent of the United States and of any and all other countries which he should acquire or take over thereafter, relating to the class of machines covered by the agreement.

In December, 1910, defendants, in pursuance of their general purpose, through United Shoe Machinery Company, of New Jersey, acquired, for $25,000 in cash, the business of Maurice V. Bresnahan, William H. Bresnahan, and John J. Donlan, doing business under the firm name of M. V. Bresnahan & Company, at Lynn, Mass., engaged in the manufacture and in interstate trade and commerce in the sale and shipment of machines, tools, mechanisms, and devices designed and used in the manufacture of boots and shoes. The vendors agreed to enter the employ of the vendee. Defendants required and took from the vendors covenants that neither of them
should engage in, directly or indirectly, within 10 years after
1301 the termination of their employment, or financially or other-

wise assist any person, firm, or corporation to enter into, develop or carry on any business in any way relating to or pertaining to manufacturing, selling, or otherwise dealing in any machinery, mechanisms, tools, or devices adapted for use in the manufacture of boots and shoes, or in any business which would in any way interfere or compete with the business of said United Company; and they and each of them further agreed to convey to said United Company, for the same consideration, all inventions, improvements, letters patent, and applications therefor which they should make or acquire, or have an interest in, at any time within 10 years after the termination of said employment agreement relating to shoe machinery. The plant has been closed.

In April, 1911, defendants, in pursuance of their general purpose, through United Shoes Machinery Company, of New Jersey, acquired, for approximately $122,735 cash, the business of Charles P. Stanbon, doing business under the name of Charles P. Stanbon & Company, Lynn, Mass., long engaged in interstate trade and commerce in the manufacture, sale, and lease of machines, tools, mechanisms, and devices designed and used in the manufacture of boots and shoes. The vendor agreed to enter the employ of said United Shoe Machinery Company.

Since the organization of United Shoe Machinery Com-
1302 pany, of New Jersey, as aforesaid, and the acquisition through it of the properties of the various individuals and corporations as aforesaid defendants' entire business has been and now is conducted under one control, and in perfect harmony, and the competition which previously existed between said several concerns has been entirely destroyed.

VIII.

DOMINATION BY DEFENDANTS OF FOREIGN TRADE AND COMMERCE IN SHOE MACHINERY.

In addition to the foregoing, defendants, through United Shoe Machinery Company, of New Jersey, by the purchase of all or a controlling interest in the business of a number of individuals and corporations engaged in the shoe machinery business in foreign countries, by the organization of other corporations and the ownership of their capital stock, and by contracts, agreements, and combinations with such corporations, have restrained and monopolized, and now restrain and monopolize, trade and commerce in shoe machinery between this and foreign countries; the principal countries whose commerce with the United States is thus restrained and monopolized being as follows: Great Britain and Ireland, through a combination with the British United Shoe Machinery Company (Ltd.), a corporation or-

ganized under the laws of Great Britain; Norway, Sweden, and Denmark, through a combination with Aktieselskabet United Shoe
1303 Machinery Company of Copenhagen, a corporation organized under the laws of Denmark; the Dominion of Canada, through a combination with United Shoe Machinery Company of Canada, a corporation organized under the laws of the State of New Jersey; Germany, Austria, and Russia, through a combination with Deutsche Vereinigte Schuhmaschinen Gesellschaft G. m. b. H., a corporation organized under the laws of Germany; France, through a combination with United Shoe Machinery Company de France, a corporation organized under the laws of the Republic of France; Switzerland, through a combination with Schweiz. Vereinigte Schuhmaschinen A.-G., a corporation organized under the laws of Switzerland; Spain and Portugal, through a combination with the United Shoe Machinery Company, of Connecticut, a corporation organized under the laws of the State of Connecticut; the various States of South America, through a combination with the United Shoe Machinery Company of South America, a corporation organized under the laws of the State of Maine; and Mexico, through the United Shoe Machinery Company of Mexico, a corporation organized under the laws of the State of Maine.

Defendants maintain and operate factories at divers places in the United States and in foreign countries, and, among others, at Beverly, Brockton, West Medway, and New Bedford, Mass.; New York and Rochester, N. Y.; Cincinnati, Ohio; Manchester, N. H.; Seymour and Ansonia, Conn.; Montreal, Canada; Leicester,
1304 England; and Ivry sur Seine, France. The manufactured output of all the defendants is advertised, sold, leased, and transported to their agents, purchasers, and lessees throughout the various States of the United States and abroad as a part of interstate and foreign commerce.

IX.

ORGANIZATION OF UNITED SHOE MACHINERY CORPORATION, ITS PURPOSES, AND OPERATIONS.

For some time prior to April, 1905, defendants had under consideration the question of distributing among the holders of common stock of United Shoe Machinery Company, of New Jersey, a portion of the accumulated profits of that company, in addition to the regular dividends theretofore paid. To provide means therefor, and to secure better facilities for destroying competition and restraining and monopolizing interstate and foreign trade and commerce in shoe machinery, the directors, officers, and stockholders of

United Shoe Machinery Company, of New Jersey, caused to be organized, in May, 1905, under the laws of New Jersey, United Shoe Machinery Corporation with an authorized capital of $50,000,000 ($15,000,000 preferred, $35,000,000 common).

The objects of this corporation are declared in its charter to be not only to manufacture, sell, and lease shoe machinery, but to engage in practically every conceivable line of human industry and mercantile pursuits.

1305 United Shoe Machinery Corporation, shortly after its organization, acquired substantially all of the capital stock, preferred and common, of United Shoe Machinery Company, of New Jersey, giving therefor one share of the preferred stock of the corporation and 37½ cents in cash for each share of preferred, and one and one-half shares of its common stock and 75 cents in cash for each share of common stock, of United Shoe Machinery Company, of New Jersey. The dividends thus distributed among the common-stock holders amounted to about $5,360,404 in stock and about $321,624 in cash. At the time of the organization of United Shoe Machinery Corporation, United Shoe Machinery Company, of New Jersey, had an issued capital stock of $20,657,894 ($9,937,084.50 preferred, $10,720,809.50 common). By the issue of one and one-half shares of the common stock of United Shoe Machinery Corporation for each share of common stock of United Shoe Machinery Company, of New Jersey, the corporation required an issued capital stock of $26,018,298.75 ($9,937,084.50 preferred, $16,081,214.25 common).

The business of United Shoe Machinery Corporation has been confined to holding the stock of United Shoe Machinery Company, of New Jersey, and financing said company and its subsidiaries. United Shoe Machinery Company, of New Jersey, has continued as an operating company. Its officers and directors always have been and now are the officers and directors of United Shoe Ma-

1306 chinery Corporation. United Shoe Machinery Corporation and United Shoe Machinery Company, of New Jersey, acting directly in the name of either or both of them, or through other defendant corporations, own a controlling interest in the capital stock of all the other corporate defendants, except Boston Blacking Company, and dictate the election of their officers and directors, and dominate and control the conduct of their business and affairs. All of them are engaged in interstate trade and commerce, and many of them in foreign trade and commerce, in the sale, lease, and shipment of shoe machinery, and by agreement each one refrains from competing with each and every one of the others, and all have cooperated and are now cooperating for the purpose of securing the retirement from the shoe machinery business, except in association with them as employees or otherwise, of all successful, capable persons engaged

therein, to exclude all others therefrom, to destroy competition therein, and to monopolize the same for their own use and benefit to the detriment of the boot and shoe manufacturers engaged in business throughout the United States and of the public generally.

X.

PROFITS.

As the result of the unlawful contracts, combinations, conspiracies, and monopolies heretofore detailed defendants and others connected and associated with them have made enormous and
1307 unreasonable profits, the extent of which can not with accuracy be stated because, among other things, of the large number of associated corporations, the manipulations of securities, and the excessive valuation of properties for which stock was given in exchange.

United Shoe Machinery Company, of New Jersey, after it took over, in 1899, the properties and businesses of the old concerns, began business with an issued capital stock of $17,318,425 ($8,657,700 preferred, $8,660,725 common), and a surplus of about $500,000 in cash. That company sold stock for cash, during the period from 1899 to May, 1905, when its stock was taken over by United Shoe Machinery Corporation, amounting approximately to $3,000,000. During that period it paid dividends of 6 per cent on its preferred, aggregating about $3,466,085, and on its common stock 8 per cent, aggregating about $4,837,939, and accumulated a surplus of approximately $6,710,914.

From its organization in 1905 to July, 1911, United Shoe Machinery Corporation has paid 6 per cent per annum on its preferred stock (aggregating about $5,700,000) and has paid in stock dividends to its holders of common stock about $9,167,780 and approximately $11,000,000 in cash, or a total of about $20,167,780 as dividends to common-stock holders.

In May, 1905, United Shoe Machinery Company, of New Jersey, had a surplus of approximately $6,710,914. On March 1, 1911,
1308 that company's surplus was approximately $20,669,799, and that of United Shoe Machinery Corporation about $5,787,596, or a total of $26,457,395. Deducting the surplus of $6,710,914 which United Shoe Machinery Company, of New Jersey, had in 1905, their reports to stockholders show that the net earnings of the two companies since March 1, 1905, amount to approximately $45,314,261, or more than 37 per cent per annum on an actual investment of not exceeding $20,000,000.

XI.

EFFECT OF DEFENDANTS' UNLAWFUL AGREEMENTS, COMBINATIONS, AND CONSPIRACIES.

By virtue of the unlawful contracts and combinations above described defendants control all the large and important establishments in the United States which were formerly engaged in the manufacture, sale, and lease of machines designed and used for attaching the bottoms to the uppers of boots and shoes, and kindred and auxiliary machines; they have obligated scores of successful shoe machinery men to refrain from trade and commerce therein and have acquired a monopoly of interstate and foreign trade and commerce in shoe machinery, and have become so powerful that successful competition therein with them by any concern is practically impossible.

The extent of their monopoly is indicated by the fact that they now control more than 98 per cent of the manufacture, sale,
1309 and lease of all the essential and kindred and auxiliary machines and devices manufactured and used in the United States for attaching the bottoms to the uppers of boots and shoes; and they have it within their power to double or treble the royalties for the use of their machines whenever they may deem such action advisable.

XII.

CONCLUSION.

The acts of defendants, hereinbefore described are violative of the said act of Congress approved July 2, 1890, entitled "An act to protect trade and commerce against unlawful restraints and monopolies," in this:

1st. The organization of United Shoe Machinery Company, of New Jersey, by a consolidation of the properties and businesses of the several companies mentioned, was unlawful, because some of said companies were engaged in interstate and foreign trade and commerce in a line of business competing with that of others of said companies, which competition was thereby destroyed, and it was intended by the individuals who originated and perfected said plan of organization that all competition between the component companies should be destroyed, and it was further intended by the consolidation of the ownership of the principal lines of shoe machinery to create a dominating and irresistible power in the entire shoe
1310 machinery business, and to use that power, in the manner herein described, to monopolize interstate and foreign trade and commerce in shoe machinery, all of which has been fully consummated.

2nd. The various provisions in the leases and license agreements heretofore described are unlawful in this:

(a) It was not lawful for the lessor to exact of the lessee (i) a covenant that the lessee should use exclusively machines of the lessor to perform the same kind of work as that performed by the leased machine; (ii) a covenant that the lessee would use in accomplishing work other than that for which the leased machine was designed only machines controlled or leased by the lessor; (iii) a condition that should the lessee violate either of the covenants mentioned the lessee would thereby forfeit the use, not only of the machine leased, but other machines, both those designed to accomplish the same work as the leased machine and those designed to accomplish work entirely different; (iv) a covenant that the lessee should use the leased machine for seventeen years.

(b) All of the covenants and conditions above described in paragraph (a) are unlawful, regardless of whether the leased machines, mechanisms, or devices are protected by valid letters patent; in a number of instances the basic patents on the leased machines expired after the execution and before the termination of the lease
1311 and license agreements, and in others, the machines were not protected by valid basic patents when leased.

(c) The covenants and conditions appearing in the various lease and license agreements, examples of which are appended hereto, as exhibits, were and are required in pursuance of the general intent and purpose of defendants to restrain interstate and foreign trade and commerce and to monopolize the same, and are one of the most effective parts of the scheme initiated by the contracts and conspiracy to organize United Shoe Machinery Company, of New Jersey, and continued to the present time by the acquisition of the properties of competing companies and by the other acts heretofore described.

3rd. The acquisition by defendants, operating through United Shoe Machinery Company, of New Jersey, of the properties and business, or the controlling influence over the properties and business, of each and every one of the individuals and corporations heretofore described, was unlawful, because made with an intent, and in pursuance of a combination and conspiracy, to restrain and monopolize interstate and foreign trade and commerce, and did in fact restrain and monopolize the same.

4th. The other unfair and oppressive acts heretofore described were unlawful because made with the intent and as a part of a scheme to restrain and monopolize interstate and foreign trade
1312 and commerce, and because they did in fact restrain and monopolize the same; and said acts being unfair and oppressive,

and committed for an unlawful purpose, render the entire scheme of which they were a part unlawful.

5th. The organization, as described, of United Shoe Machinery Corporation and the acquisition by it of the capital stock of United Shoe Machinery Company, of New Jersey, was and is unlawful because done to better enable defendants to expand their business in shoe machinery and to render their restraint upon and monopoly of interstate and foreign trade and commerce in such business the more complete and effectual.

Complainant therefore alleges that the contracts and agreements by which United Shoe Machinery Company, of New Jersey, was organized and every contract and agreement by which it has acquired the business and properties of former competing concerns since its organization were and are unlawful, and that the continued existence of United Shoe Machinery Company, of New Jersey, and of United Shoe Machinery Corporation, and of the combinations and agreements between them and the several individual and corporate defendants, is an open defiance of the law, and that said organizations should be dissolved, and said contracts, combinations, and conspiracies should be declared null and void in order that the normal condition of competition in interstate and foreign trade and commerce in shoe machinery may be restored.

1313

XIII.

PRAYER.

Inasmuch as adequate remedy in the premises only can be obtained in equity, your petitioner prays your honors—

1. To order, adjudge, and decree that the contracts, combinations, and conspiracies hereinbefore described are unlawful and that all acts done or to be done in furtherance of the same are in violation of the act of Congress of July 2, 1890, entitled "An act to protect trade and commerce against unlawful restraints and monopolies," and that the defendants, and each of them, and their officers, directors, stockholders, agents, and servants, and each of them, be perpetually enjoined and restrained from doing any act in pursuance of or for the purpose of carrying out the same.

2. That this court adjudge and decree that all lease and license agreements containing like or similar exclusive-use and tying provisions, as are contained in the forms hereto appended, which defendants have devised, adopted, and used, and are now using, and which are now in force, be declared illegal and void, and that the defendants, and each of them, and their officers, directors, stockholders, agents, and servants, and each of them, be perpetually enjoined and

restrained from enforcing or attempting to enforce any of the exclusive-use and tying provisions of such lease and license
1314 agreements, or of any lease and license agreements of like or similar character which defendants have used and are now using and which are now in force.

3. That defendants, and each of them, and their officers, directors, stockholders, agents, and servants, and each of them, be perpetually enjoined and restrained from making or enforcing any contracts, arrangements, agreements, or requirements with boot or shoe manufacturers to purchase or lease from said defendants either lasting machines, welt-sewing machines, or outsole-stitching machines, heeling machines, lacing machines, eyeletting machines, pulling-over machines, clicking machines, auxiliary machines, finishing machines, or pegging machines, or any other machines, mechanisms, tools, or devices, or any of them, owned and controlled by defendants, by which such boot and shoe manufacturers are compelled to purchase or lease any one or more of the above-named machines, or any other machines, mechanisms, tools, or devices, from said defendants, as a condition to the purchase or lease or supply of any other or all of said machines, or of any other machines, mechanisms, tools, or devices, or of any of them; and that defendants, and each of them, and their officers, directors, stockholders, agents, and servants, and each of them, be perpetually enjoined and restrained from discriminating against any boot or shoe manufacturer desiring to purchase or lease any of said machines, or any other machines, mecha-
1315 nisms, tools, or devices, or any of them, because of the fact that such boot or shoe manufacturer purchases or leases any one or more of said machines from others.

4. That defendants, and each of them, and their officers, directors, stockholders, agents, and servants, and each of them, be perpetually enjoined and restrained from making discounts or granting rebates, either by way of reduction of royalties on machines leased and licensed by them, or by cash discounts, or by any other scheme or device whatsoever, to boot or shoe manufacturers, to use exclusively, or as an inducement to them to use exclusively machines, mechanisms, tools, or devices, or any of them, owned and controlled by defendants.

5. That the court order, adjudge, and decree that United Shoe Machinery Corporation and United Shoe Machinery Company, of New Jersey, is each a combination in restraint of interstate and foreign trade and commerce, and that each has attempted and is attempting to monopolize, is in combination and conspiracy with other persons and corporations to monopolize, and has monopolized, part of the trade and commerce among the several States of the United States and with foreign nations, and order, adjudge, and

decree that each of them be restrained from engaging in interstate or foreign commerce, and that each of them be dissolved and sepa-
1316 rated into such parts that no one of them will constitute a monopoly or can become a monopoly of the shoe machinery business, or, if the court should be of the opinion that the public interest will be better subserved thereby, that receivers be appointed to take possession of all the property, assets, business, and affairs of said defendants and wind up the same, and otherwise take such course in regard thereto as will bring about conditions in trade and commerce among the States and with foreign nations in harmony with law.

6. That the holding of stock by one of the defendant corporations in another under the circumstances shown be declared illegal, and that each of them be enjoined from continuing to hold or own such shares in another and from exercising any right in connection therewith.

7. That defendants, and each of them, be enjoined from continuing to carry out the purposes of the above-described contracts, combinations, conspiracies, attempts to monopolize, and monopolies by the means herein described, or by any other, and be required to desist and withdraw from all connection with the same.

8. That petitioner have such other, further, and general relief as may be proper.

9. To the end, therefore, that the United States of America may obtain the relief to which it is justly entitled in the premises, may it please your honors to grant unto it writs of subpœna di-
1317 rected to the said defendants, United Shoe Machinery Company, of New Jersey, United Shoe Machinery Corporation, United Shoe Machinery Company, of Maine, United Shoe Repairing Machine Company, United-Xpedite Finishing Company, United Awl & Needle Company, United Fast Color Eyelet Company, O. A. Miller Treeing Machine Company, W. W. Cross & Company, Inc., S. A. Felton & Son Company, Campbell-Bosworth Machinery Company, Boston Blacking Company, J. C. Rhodes & Company, Inc.; The Rimmon Eyelet Company, Ross-Moyer Manufacturing Company, J. K. Krieg Company, Booth Brothers Company, S. O. & C. Corporation, Ellis Lacer Company, Thomas G. Plant Company, Sidney W. Winslow, William Barbour, Wallace F. Robinson, George W. Brown, Edward P. Hurd, John H. Connor, Louis A. Coolidge, Edwin P. Brown, Frank L. Babbott, Henry B. Endicott, Edmund LeB. Gardner, John H. Hanan, Elmer P. Howe, Joseph C. Kilham, George E. Keith, Rudolph Matz, Charles G. Rice, Alfred R. Turner, Samuel Weil, Frank Wood, William Woodward, Harold G. Donham, and Edward N. Chase, and each and every one of them, commanding them, and each of them, to appear herein and answer, but not under oath (answer under oath being hereby expressly waived), the

allegations contained in the foregoing petition and abide by and perform such orders and decree as the court may make in the premises, and pending a final hearing of this case cause a tempo-
1318 rary restraining order to issue enjoining the defendants, and each of them, and each of their officers, agents, and servants, as hereinbefore prayed.

ASA P. FRENCH,
United States Attorney for the District of Massachusetts.
GEO. W. WICKERSHAM,
Attorney General.
J. A. FOWLER,
Assistant to the Attorney General.
WILLIAM S. GREGG,
Special Assistant to the Attorney General.

1320 District Court of the United States, District of Massachusetts.

UNITED STATES OF AMERICA *v.* UNITED SHOE MACHINERY COMPANY OF NEW JERSEY et al.	In Equity.—No. 301 (C.C.911).

Joint and several answer of the defendants Sidney W. Winslow, William Barbour, Wallace F. Robinson, George W. Brown, Edward P. Hurd, John H. Connor, Louis A. Coolidge, Edwin P. Brown, Frank L. Babbott, Henry B. Endicott, Edmund LeB. Gardner, John H. Hanan, Elmer P. Howe, Joseph C. Kilham, George E. Keith, Rudolph Matz, Charles G. Rice, Alfred R. Turner, Samuel Weil, Frank Wood, William Woodward.

[Filed April 1, 1912.]

These defendants, jointly and severally, now, and at all times hereafter, saving and reserving unto themselves all benefit and advantage of exception which can or may be had or taken to the many errors, uncertainties, and other imperfections in the said petitioner's said bill of complaint contained, for answer thereto, or unto so much and such parts thereof as these defendants are advised is or are material or necessary for them to make answer unto, these defendants for answer say:

I. These defendants admit that they were at the time of the filing of the bill and now are directors of the United Shoe
1321 Machinery of New Jersey and the United Shoe Machinery Corporation, as alleged on pages 6 and 7 of said bill, except

[NOTE.—Pages 1 to 223, inclusive, comprise petition of United States of America, Petitioner, in this case, filed in Circuit Court December 12, 1911, and is bound in a separate volume.]

they say that defendant Frank L. Babbott was not at the time of the filing of the bill and is not now a director of either of said corporations.

II. These defendants further admit that Sidney W. Winslow was, at the time of the filing of the bill, and now is, president and director of the respective corporations of which he is alleged in said bill, at page 7, to be the president and director.

These defendants admit that William Barbour was, at the time of the filing of the bill, and now is, vice president and director, respectively, of the respective corporations of which he is alleged in said bill, at page 7, to be the vice president and director.

These defendants admit that George W. Brown was, at the time of filing of the bill, and now is, vice president and director, respectively, of the respective corporations of which he is alleged in said bill, at page 8, to be the vice president and director.

These defendants admit that Edward P. Hurd was, at the time of the filing of the bill, and now is, vice president and director, respectively, of the respective corporations of which he is alleged in said bill, at page 8, to be the vice president and director.

These defendants admit that Louis A. Coolidge was, at the time of the filing of the bill, and now is, a director of the corporations of which he is alleged in said bill, at pages 8 and 9, to be a director.

These defendants admit that Edwin P. Brown was, at the time of the filing of the bill, and now is, a director of the corporation of which he is alleged in said bill, at page 9, to be a director.

These defendants further admit the respective residences of each of the said defendants as set forth on pages 9 and 10 of said bill.

III. These defendants jointly and severally deny every allegation, item, and particular of the petitioner's bill of complaint as fully and specifically as if each allegation were in terms specifically denied, and particularly deny each and every allegation, item, and particular contained in the first twelve sections of the petitioner's bill of complaint, contained on pages 1 to 83, inclusive, of said bill of complaint, except so far as any of the same are hereinbefore expressly admitted.

1322 IV. Further answering, these defendants jointly and severally say that the United Shoe Machinery Company of New Jersey was organized under the laws of the State of New Jersey in February, 1899, and more than twelve years prior to the bringing of this petition, for the purposes and with the powers set forth and contained in its charter, among which are the following:

"To manufacture, buy, sell, lease, operate, and deal in and with all kinds of machinery, tools and implements, and mechanical devices and contrivances of every name and nature whatsoever, and especially to manufacture, buy, sell, lease, operate, and deal in and

with all sorts of boot and shoe machinery and every kind of mechanism, contrivance, implement, tool, material, or thing in any way whatsoever connected with or useful in connection with the manufacture of boots, shoes, and footwear or the manufacture of leather and rubber goods, or goods made from materials and fabrics of any description whatsoever, or useful in connection with the manufacture or operation of any of the machinery, mechanical devices, or contrivances hereinbefore mentioned: to produce, prepare, and manufacture, buy, sell, and deal in and with leather and rubber, and materials and fabrics of all sorts, and the raw materials from which said leather, rubber materials, or fabrics are produced: to manufacture, buy, sell, and deal in and with boots, shoes, and footwear and all articles and things of every description that may be produced or manufactured, in whole or in part, from leather, rubber, or any other materials or fabrics; and in general to produce, prepare, manufacture, and deal in and with goods, wares, merchandise, property, materials, and things of every class and description. . . .

"To apply for, obtain, register, purchase, lease, or otherwise acquire, and to hold, own, use, operate, sell, assign, or otherwise dispose of any and all trade-marks, trade names, and distinctive marks, copyrights, and patent rights, and all inventions, improvements, and processes used in connection with or secured under letters patent of the United States or elsewhere, or otherwise, and to use, exercise, develop, grant licenses in respect of, or otherwise turn to account any such trade-marks, patents, licenses, concessions, processes and the like."

and these defendants offer to produce at the trial of this case a certified copy of the said charter of said United Shoe Machinery Company of New Jersey, and make profert thereof.

V. Further answering, these defendants jointly and severally say that shortly after the organization of the United Shoe Machinery Company of New Jersey and pursuant to and in accordance
1323 with the terms of its said charter and more than twelve years prior to the bringing of this petition, said United Shoe Machinery Company of New Jersey acquired the capital stock, or a majority of the same, of the following corporations, organized under the laws of the State of Maine: Consolidated & McKay Lasting Machine Company, McKay Shoe Machinery Company, Goodyear Shoe Machinery Company, International Goodyear Shoe Machinery Company, Eppler Welt Machine Company, International Eppler Welt Machine Company, Davey Pegging Machine Company, and the Goodyear Shoe Machinery Company of Canada, a corporation organized under the laws of the State of New Jersey; and thereafter acquired the business, assets, and letters patent of each of said corporations.

Each of said corporations, at the time of such acquisition, was engaged in an independent and noncompeting business, differing from that of any others of the said corporations.

Each of said corporations, except the Goodyear Shoe Machinery Company of Canada, the International Goodyear Shoe Machinery Company, and the International Eppler Welt Machine Company, at the time of such acquisition was engaged, under letters patent of the United States, in the manufacture of machines and parts thereof used in the manufacture of boots and shoes, and each of said corporations leased the machines so manufactured by it to shoe manufacturers, and licensed such shoe manufacturers to use the same under its said letters patent.

The Goodyear Shoe Machinery Company of Canada, the International Goodyear Shoe Machinery Company, and the International Eppler Welt Machine Company, at the time of such acquisition, were engaged, under letters patent of the foreign countries in which they did business, in the manufacture of machines and parts thereof used in the manufacture of boots and shoes, and each of said corporations, respectively, leased the machines so manufactured by it to shoe manufacturers and licensed such shoe manufacturers to use the same under its said letters patent.

VI. Further answering, these defendants jointly and severally say that the organization of the United Shoe Machinery Com-
1324 pany of New Jersey and its acquisition of the capital stock and businesses of said last-named corporations, as set forth in the two preceding paragraphs hereof, was simply the fusion of several corporations owning noncompeting, complementary machines covered by letters patent of the United States into one corporation, and was made with the expectation of an increase in business, economies in administration, and decrease in expenses, and cessation of patent litigation between the companies purchased, which had been expensive to them and annoying to shoe manufacturers, which results it was expected could be attained without increase of cost to the users of machinery made by the United Shoe Machinery Company of New Jersey, and that better attention to the care of the machines and assistance to the users could be afforded by the said United Shoe Machinery Company of New Jersey.

That said organization and acquisition was nothing more than the combination of various elements of machinery, all relating to the same art and the same school of manufactures, for the purpose of constructing economically and systematically and of furnishing a lessee the whole or any part of a gradually developed system of machines for use in the manufacture of shoes, and was and is in strict and normal compliance with modern trade progress.

VII. Further answering, these defendants jointly and severally say that since the organization of said United Shoe Machinery Company of New Jersey in 1899, said United Shoe Machinery Company of New Jersey has acquired from time to time, in the natural development and ordinary growth of its business, from various persons and corporations, various inventions, letters patent therefor, and businesses, in pursuance of the powers granted it under its said charter, all relating to the same art and the same school of manufactures, in order to better supply the demands of its lessees in accordance with the normal growth and development of its business. The greater part of said acquisitions are entirely new fields, having no connection with the machines originally acquired, owned, and manufactured by said United Shoe Machinery Company of New Jersey. Some of said acquisitions have more or less relation to
1325 the original lines of shoe machinery owned by said United Shoe Machinery Company of New Jersey, and were acquired by it for the purpose of compromising, settling, and avoiding expensive patent litigation, and for the purpose of protecting its lessees from suits for infringement of letters patent.

VIII. Further answering, these defendants jointly and severally say that the greater part of the business of said United Shoe Machinery Company of New Jersey consists in the manufacture, under letters patent of the United States, owned by it, of machines used in the manufacture of boots and shoes, and for the most part relating to the bottoming of boots and shoes, and in the leasing of machines so manufactured by it to shoe manufacturers, under licenses under said letters patent.

IX. Further answering, these defendants jointly and severally say that the greater part of the acts of said United Shoe Machinery Company of New Jersey complained of in said bill took place more than six years prior to the filing of said bill, and are barred by the statute of limitations.

X. Further answering, these defendants jointly and severally deny that they or either of them ever combined, contracted, and conspired with any person, firm, or corporation mentioned in said bill of complaint, or with any other person, firm, or corporation, to restrain interstate and foreign trade and commerce in shoe machinery used in the manufacture of boots and shoes, or in any other business, or that they or either of them ever monopolized or attempted to monopolize said interstate trade or commerce or said foreign trade or commerce, and these defendants further jointly and severally say that if said United Shoe Machinery Company of New Jersey is engaged in interstate trade and commerce—which they deny—and has any monopoly of such trade or commerce—which they deny—then these

defendants jointly and severally say that any such monopoly is a valid and legal monopoly of such trade and commerce derived under and pursuant to and coextensive with letters patent of the United States or of foreign countries owned by said United Shoe Machinery Company of New Jersey.

XI. Further answering, these defendants jointly and severally say that defendant, John H. Connor, became a director of the
1326 United Shoe Machinery Company of New Jersey on or about March 8, 1911; that defendant Edwin P. Brown became a director of the United Shoe Machinery Company of New Jersey on or about September 13, 1911; that defendant Louis A. Coolidge became a director of the United Shoe Machinery Company of New Jersey on or about December 8, 1909; that defendant Henry B. Endicott became a director of the United Shoe Machinery Company of New Jersey on or about July 11, 1910; that defendant Edmund LeB. Gardner became a director of the United Shoe Machinery Company of New Jersey on or about June 27, 1908; that defendant Charles G. Rice became a director of the United Shoe Machinery Company of New Jersey on or about December 11, 1907; and that defendant William Woodward became a director of the United Shoe Machinery Company of New Jersey on or about June 15, 1907.

XII. These defendants jointly and severally admit that the United Shoe Machinery Corporation was organized under the laws of New Jersey, in May, 1905, with an authorized capital of fifty million dollars ($50,000,000) (fifteen million dollars preferred and thirty-five million dollars common), but deny that it was organized by the directors, officers, and stockholders of the United Shoe Machinery Company of New Jersey or for the purpose of destroying competition or restraining or monopolizing interstate or foreign trade and commerce in shoe machinery. And answering say said United Shoe Machinery Corporation was organized for the legitimate and lawful purposes in its charter set forth. They jointly and severally aver that from time to time since its organization said United Shoe Machinery Corporation has purchased stock of the United Shoe Machinery Company of New Jersey, and has paid therefor partly in shares of its own stock and partly in cash, and that it has acquired practically all the common and preferred shares of the latter company, and says that the stock of the United Shoe Machinery Company so acquired was worth in the market all that the United Shoe Machinery Corporation gave in exchange for it.

They jointly and severally admit that the business of the United Shoe Machinery Corporation has been up to the time of bringing this bill holding shares of stock of the United Shoe Machinery
1327 Company, and since September, 1910, shares of stock of the Thomas G. Plant Company, and that it has not engaged in

manufacturing shoe machinery or in trade or commerce of any kind therein.

They jointly and severally admit that the officers and directors of said United Shoe Machinery Corporation are officers and directors of the United Shoe Machinery Company of New Jersey, but they jointly and severally deny that said United Shoe Machinery Corporation holds a controlling interest in any of the corporate defendants except said United Shoe Machinery Company of New Jersey and said Thomas G. Plant Company, and deny that it dictates the election of the officers and directors or dominates or controls the conduct of the business and affairs of any corporate defendant except its own.

They jointly and severally deny that said United Shoe Machinery Corporation is in any manner engaged in interstate or foreign trade or commerce or in the sale, lease, or shipment of shoe machinery, and deny that said United Shoe Machinery Corporation has or has at any time had any agreement with any other defendant or person whatsoever to refrain from competing with it, or that it has cooperated or is now cooperating with the other defendants or any of them to secure the retirement from the shoe machinery business of any persons or corporations whatsoever, or to exclude others therefrom, or destroy competition therein, or to monopolize the same to the detriment of the public or any person whatsoever.

All the other allegations of the bill not herein admitted are specifically denied.

And further answering, these defendants, jointly and severally, say that the United Shoe Machinery Corporation was organized for a lawful purpose and has always conducted its business and affairs in conformity with the law, has engaged in no combinations, contracts or agreements or monopolies in restraint of interstate or foreign trade or commerce.

And these defendants, jointly and severally, deny all and all manner of unlawful combination and confederacy wherewith they are by said bill charged, without this, that there is any other
1328 matter, cause, or thing in the said petitioner's said bill of complaint contained material or necessary for these defendants to make answer unto and not herein and hereby well and sufficiently answered, confessed, traversed, and avoided or denied, is true, all which matters and things these defendants are ready and willing to aver, maintain, and prove as this honorable court shall direct, and humbly pray to be hence dismissed, with their reasonable costs and charges in this behalf most wrongfully sustained.

By their solicitor:

H. G. DONHAM.

Answer of Defendant Harold G. Donham.

[Filed April 1, 1912.]

This defendant now, and at all times hereafter, saving and reserving unto himself all benefits and advantage of exception which can or may be had or taken to the many errors, uncertainties, and other imperfections in the said petitioner's said bill of complaint contained, for answer thereto, or unto so much and such parts thereof as this defendant is advised is or are material or necessary for him to make answer unto, this defendant for answer says:

I. This defendant admits that he is president and a director of the Rimmon Eyelet Company, as alleged respectively on pages 5 and 9 of said petition.

II. This defendant admits that the individual defendants named at the bottom of page 6 of said petition are directors of the United Shoe Machinery Company of New Jersey and the United Shoe Machinery Corporation, with the exception that Frank L. Babbott was not at the time of the filing of said petition a director of either corporation.

III. This defendant denies every allegation, item and particular of the petitioner's bill of complaint as fully and specifically as if each allegation were in terms specifically denied, and particularly denies each and every allegation, item, and particular contained in the first twelve sections of petitioner's bill of complaint, contained on pages 1 to 83, inclusive, of said bill of complaint, except so far as any of the same are hereinbefore expressly admitted.

1329 IV. Further answering, this defendant expressly denies that he is engaged in trade and commerce in shoe machinery, or that he ever combined, contracted and conspired with any person, firm, or corporation mentioned in said bill of complaint, or with any other person, firm, or corporation to restrain interstate and foreign trade and commerce in shoe machines used in the manufacture of boots and shoes, or in any other business, or that he ever monopolized or attempted to monopolize said interstate trade and commerce or said foreign trade and commerce.

And this defendant denies all and all manner of unlawful combination and confederacy wherewith he is by said bill charged, without this, that there is any other matter, cause, or thing in the said petitioner's said bill of complaint contained material or necessary for this defendant to make answer unto and not herein and hereby well and sufficiently answered, confessed, traversed, and avoided or denied, is true, all which matters and things this defendant is ready and willing to aver, maintain, and prove as this

honorable court shall direct, and humbly prays to be hence dismissed, with his reasonable costs and charges in this behalf most wrongfully sustained.

HAROLD G. DONHAM.

Answer of defendant United Shoe Machinery Corporation.

[Filed April 1, 1912.]

This defendant now, and at all times hereafter, saving and reserving unto itself all benefits and advantages of exception which can or may be had or taken to the many errors, uncertainties, and other imperfections in the said petitioner's said bill of complaint contained, for answer thereto, or unto so much and such parts thereof as this defendant is advised is or are material or necessary for it to make answer unto, this defendant for answer says:

I. As to all the allegations of the bill regarding conditions, events, and acts prior to its incorporation in May, 1905, this defendant is ignorant and leaves the complainant to prove the same if material.

1330 II. It admits it was organized under the laws of New Jersey, in May, 1905, with an authorized capital of fifty million dollars ($50,000,000) (fifteen million dollars preferred and thirty-five million dollars common), but denies that it was organized by the directors, officers, and stockholders of the United Shoe Machinery Company or for the purpose of destroying competition or restraining or monopolizing interstate or foreign trade and commerce in shoe machinery. And answering, says that it was organized for the legitimate and lawful purposes in its charter set forth. It avers that from time to time since its organization it has purchased stock of the United Shoe Machinery Company of New Jersey, and has paid therefor partly in shares of its own stock and partly in cash, and that it has acquired practically all the common and preferred shares of the latter company, and says that the stock of the United Shoe Machinery Company of New Jersey so acquired was worth in the market all that this defendant gave in exchange for it.

III. It admits that its business has been up to the time of bringing this bill, holding shares of stock of the United Shoe Machinery Company of New Jersey, and since September, 1910, shares of stock of the Thomas G. Plant Company, and that it has not engaged in manufacturing shoe machinery or in trade or commerce of any kind therein.

IV. It admits that Henry B. Endicott, Edwin P. Brown, Edmund LeB. Gardner, John H. Hanan, Elmer P. Howe, Joseph C. Kilham, George E. Keith, Rudolph Matz, Charles G. Rice, Alfred R. Turner,

Wallace F. Robinson, Samuel Weil, Frank Wood, William Woodward, and Louis A. Coolidge are directors of this defendant; that Sidney W. Winslow is its president and a director; that William Barbour is its vice president and a director; that George W. Brown is its vice president and a director; that Edward P. Hurd is its vice president and a director; but it says that Frank L. Babbott was not at the time of the bringing of the bill, and has not since been, a director.

V. It admits that its officers and directors are officers and directors of the United Shoe Machinery Company of New Jersey, but it denies that it holds a controlling interest in any of the cor-
1331 porate defendants except said United Shoe Machinery Company of New Jersey, and sai dThomas G. Plant Company, and denies that it dictates the election of the officers and directors or dominates or controls the conduct of the business and affairs of any corporate defendant except its own. It denies that it is in any manner engaged in interstate or foreign trade or commerce, or in the sale, lease, or shipment of shoe machinery, and denies that it has or has at any time had any agreement with any other defendant or person whatsoever to refrain from competing with it, or that it has cooperated, or is now cooperating, with the other defendants or any of them, to secure the retirement from the shoe machinery business of any persons or corporations whatsoever, or to exclude others therefrom or destroy competition therein, or to monopolize the same to the detriment of the public or any person whatsoever.

VI. All the other allegations of the bill not herein admitted are specifically denied.

VII. And further answering, this defendant says that it was organized for a lawful purpose and has always conducted its business and affairs in conformity with the law, has engaged in no combinations, contracts, or agreements or monopolies in restraint of interstate or foreign trade or commerce.

And this defendant denies all and all manner of unlawful combination and confederacy wherewith it is by said bill charged, without this, that there is any other matter, cause, or thing in the said petitioner's said bill of complaint contained material or necessary for this defendant to make answer unto and not herein and hereby well and sufficiently answered, confessed, traversed, and avoided, or denied, is true, all which matters and things this defendant is ready and willing to aver, maintain, and prove as this honorable court shall direct, and humbly prays to be hence dismissed, with its reasonable costs and charges in this behalf most wrongfully sustained.

By its solicitor:

H. G. DONHAM.

1332 *Answer of defendant United Shoe Machinery Company of New Jersey.*

[Filed April 1, 1912.]

This defendant now, and at all times hereafter, saving and reserving unto itself all benefit and advantage of exception which can or may be had or taken to the many errors, uncertainties, and other imperfections in the said petitioner's said bill of complaint contained, for answer thereto, or unto so much and such parts thereof as this defendant is advised is or are material or necessary for it to make answer unto, this defendant for answer says:

I. This defendant admits the following allegations of Section I of the petitioner's bill, to wit:

That it is a corporation organized under the laws of New Jersey, carrying on business in the District of Massachusetts, with its office and place of business at Boston, Massachusetts, and that its president is Sidney W. Winslow, and that the amount of its issued capital stock, preferred and common, is as alleged in said Section I.

II. It admits that the defendants Henry B. Endicott, Edwin P. Brown, Edmund LeB. Gardner, John H. Hanan, Elmer P. Howe, Joseph C. Kilham, George E. Keith, Rudolph Matz, Charles G. Rice, John H. Connor, Alfred R. Turner, Wallace F. Robinson, Samuel Weil, Frank Wood, and William Woodward are directors of this defendant; that Sidney W. Winslow is its president and a director; that William Barbour is a vice president and a director; that George W. Brown is a vice president and a director; that Edward P. Hurd is a vice president and a director; that Louis A. Coolidge is a director; but says that the defendant Frank L. Babbott was not at the time of the filing of petitioner's bill, and is not now, a director of this defendant.

III. This defendant denies every allegation, item, and particular of the petitioner's bill of complaint as fully and specifically as if each allegation were in terms specifically denied, and particularly denies each and every allegation, item, and particular contained in the first twelve sections of petitioner's bill of complaint, con-
1333 tained on pages 1 to 83, inclusive, of said bill of complaint, except so far as any of the same are hereinbefore expressly admitted.

IV. Further answering, this defendant says that it was organized under the laws of the State of New Jersey in February, 1899, and more than twelve years prior to the bringing of this petition, for the purposes and with the powers set forth and contained in its charter, among which are the following:

"To manufacture, buy, sell, lease, operate and deal in and with all kinds of machinery, tools, and implements, and mechanical de-

vices and contrivances of every name and nature whatsoever, and especially to manufacture, buy, sell, lease, operate, and deal in and with all sorts of boot and shoe machinery and every kind of mechanism, contrivance, implement, tool, material or thing in any way whatsoever connected with, or useful in connection with the manufacture of boots, shoes, and footwear, or the manufacture of leather and rubber goods, or goods made from materials and fabrics of any description whatsoever, or useful in connection with the manufacture or operation of any of the machinery, mechanical devices or contrivances hereinbefore mentioned; to produce, prepare, and manufacture, buy, sell, and deal in and with leather and rubber, and materials and fabrics of all sorts, and the raw materials from which said leather, rubber materials or fabrics are produced; to manufacture, buy, sell, and deal in and with boots, shoes and footwear and all articles and things of every description that may be produced or manufactured, in whole or in part, from leather, rubber, or any other materials or fabrics; and in general to produce, prepare, manufacture, and deal in and with goods, wares, merchandise, property, materials, and things of every class and description. * * *

"To apply for, obtain, register, purchase, lease, or otherwise acquire, and to hold, own, use, operate, sell, assign, or otherwise dispose of any and all trademarks, trade-names and distinctive marks, copyrights and patent rights, and all inventions, improvements and processes used in connection with or secured under letters patent of the United States or elsewhere, or otherwise, and to use, exercise, develop, grant licenses in respect of, or otherwise turn to account any such trademarks, patents, licenses, concessions, processes and the like."

and this defendant offers to produce at the trial of this case a certified copy of its said charter, and makes profer thereof.

V. Further answering, this defendant says that shortly after its organization, and pursuant to and in accordance with the terms
1334 of its said charter, and more than twelve years prior to the bringing of this petition, it acquired the capital stock, or a majority of the same, of the following corporations, organized under the laws of the State of Maine: Consolidated & McKay Lasting Machine Company, McKay Shoe Machinery Company, Goodyear Shoe Machinery Company, International Goodyear Shoe Machinery Company, Eppler Welt Machine Company, International Eppler Welt Machine Company, Davey Pegging Machine Company, and the Goodyear Shoe Machinery Company of Canada, a corporation organized under the laws of the State of New Jersey; and thereafter acquired the business, assets and letters patent of each of said corporations.

Each of said corporations, at the time of such acquisition, was engaged in an independent and noncompeting business, differing from that of any others of the said corporations.

Each of said corporations, except the Goodyear Shoe Machinery Company of Canada, the International Goodyear Shoe Machinery Company, and the International Eppler Welt Machine Company, at the time of such acquisition, was engaged, under letters patent of the United States, in the manufacture of machines and parts thereof used in the manufacture of boots and shoes, and each of said corporations leased the machines so manufactured by it to shoe manufacturers, and licensed such shoe manufacturers to use the same under its said letters patent.

The Goodyear Shoe Machinery Company of Canada, the International Goodyear Shoe Machinery Company, and the International Eppler Welt Machine Company, at the time of such acquisition, were engaged, under letters patent of the foreign countries in which they did business, in the manfacture of machines and parts thereof used in the manufacture of boots and shoes, and each of said corporations respectively leased the machines so manufactured by it to shoe manufacturers, and licensed such shoe manufacturers to use the same under its said letters patent.

VI. Further answering, this defendant says that the organization of the United Shoe Machinery Company and its acquisition of the capital stock and businesses of said last named corporations, as
1335 set forth in the two preceding paragraphs hereof, was simply the fusion of several corporations owning noncompeting, complementary machines, covered by letters patent of the United States, into one corporation, and was made with the expectation of an increase in business, economies in administration, and decrease in expenses, and cessation of patent litigation between the companies purchased, which had been expensive to them and annoying to shoe manufacturers; which results it was expected could be attained without increase of cost to the users of machinery made by the United Shoe Machinery Company of New Jersey, and that better attention to the care of the machines and assistance to the users could be afforded by the said United Shoe Machinery Company of New Jersey.

That said organization and acquisition was nothing more than the combination of various elements of machinery all relating to the same art and the same school of manufactures, for the purpose of constructing economically and systematically, and of furnishing a lessee the whole or any part of a gradually developed system of machines for use in the manufacture of shoes, and was and is in strict and normal compliance with modern trade progress.

VII, Further answering, this defendant says that since its organization in 1899 this defendant has acquired from time to time, in the natural development and ordinary growth of its business, from various persons and corporations, various inventions, letters patent therefor, and businesses, in pursuance of the powers granted it under its said charter, all relating to the same art and the same school of manufactures, in order to better supply the demands of its customers in accordance with the normal growth and development of its business. The greater part of said acquisitions are entirely new fields, having no connection with the machines originally acquired, owned, and manufactured by this defendant. Some of said acquisitions have more or less relation to the original lines of shoe machinery owned by this defendant, and were acquired by it for the purpose of compromising, settling, and avoiding expensive patent litigation, and for the purpose of protecting its lessees from suits for infringement of letters patent.

1336 VIII. Further answering, this defendant says that the greater part of its business consists in the manufacture, under letters patent of the United States, owned by it, of machines used in the manufacture of boots and shoes, and for the most part relating to the bottoming of boots and shoes, and in the leasing of machines so manufactured by it to shoe manufacturers, under licenses under said letters patent.

IX. Further answering, this defendant says that the greater part of the acts of this defendant complained of in said bill took place more than six years prior to the filing of said bill, and are barred by the statute of limitations.

X. Further answering, this defendant denies that it ever combined, contracted, and conspired with any person, firm, or corporation mentioned in said bill of complaint, or with any other person, firm, or corporation, to restrain interstate and foreign trade and commerce in shoe machinery used in the manufacture of boots and shoes, or in any other business, or that it ever monopolized or attempted to monopolize said interstate trade and commerce, or said foreign trade and commerce, and this defendant further says that if this defendant is engaged in interstate trade and commerce, which it denies, and has any monopoly of such trade or commerce, which it denies, then this defendant says any such monopoly is a valid and legal monopoly of such trade or commerce derived under and pursuant to and coextensive with letters patent of the United States or of foreign countries, owned by it.

And this defendant denies all and all manner of unlawful combination and confederacy wherewith it is by said bill charged, without this, that there is any other matter, cause, or thing in the said petitioner's said bill of complaint contained material or necessary

1045

for this defendant to make answer unto and not herein and hereby well and sufficiently answered, confessed, traversed, and avoided or denied, is true, all which matters and things this defendant is ready and willing to aver, maintain, and prove as this honorable court shall direct, and humbly prays to be hence dismissed, with its reasonable costs and charges in this behalf most wrongfully sustained.

1337 *Answer of defendant J. K. Kreig Company.*

[Filed April 1, 1912.]

This defendant now, and at all times hereafter, saving and reserving unto itself all benefit and advantage of exception which can or may be had or taken to the many errors, uncertainties, and other imperfections in the said petitioner's said bill of complaint contained, for answer thereto, or unto so much and such parts thereof as this defendant is advised is or are material or necessary for it to make answer unto, this defendant for answer says:

I. This defendant admits that it is a corporation organized under the laws of the State of New York, with its offices and place of business at New York City, and that its president is defendant Sidney W. Winslow, and that its issued capital stock is fifty thousand dollars ($50,000) at par, as set forth on pages 5 and 6 of said bill of complaint.

II. Further answering, this defendant says that it is engaged in the business of selling general supplies for shoe manufacturers, such as wax, thread, needles, blacking, eyelets, and practically all kinds of supplies, and that it acts as distributing agent for the United Shoe Machinery Company of New Jersey of machine parts manufactured by said United Shoe Machinery Company of New Jersey for machines leased by said United Shoe Machinery Company; that it also buys from said United Shoe Machinery Company of New Jersey, and sells for its own account, machine parts for use on machines which are sold on the market; that it is distributing agent for fastening material—that is, wire nails, and similar material—for use in metallic department machinery leased by said United Shoe Machinery Company of New Jersey.

III. This defendant denies every allegation, item, and particular of the petitioner's bill of complaint as fully and specifically as if each allegation were in terms specifically denied, and particularly denies each and every allegation, item, and particular contained in the first twelve sections of petitioner's bill of complaint, contained on pages 1 to 83, inclusive, of said bill of complaint, except so far as any of the same are hereinbefore expressly admitted.

1338 IV. Further answering, this defendant expressly denies that it ever combined, contracted, and conspired with any person, firm, or corporation mentioned in said bill of complaint, or with any other person, firm, or corporation, to restrain interstate and foreign trade and commerce in shoe machinery used in the manufacture of boots and shoes or in any other business; or that it ever monopolized or attempted to monopolize said interstate trade and commerce or said foreign trade and commerce.

And this defendant denies all and all manner of unlawful combination and confederacy wherewith it is by said bill charged, without this, that there is any other matter, cause, or thing in the said petitioner's said bill of complaint contained material or necessary for this defendant to make answer unto and not herein and hereby well and sufficiently answered, confessed, traversed, and avoided or denied, is true, all which matters and things this defendant is ready and willing to aver, maintain, and prove as this honorable court shall direct, and humbly prays to be hence dismissed, with its reasonable costs and charges in this behalf most wrongfully sustained.

Answer of defendant Booth Brothers Company.

[Filed April 1, 1912.]

This defendant now, and at all times hereafter, saving and reserving unto itself all benefit and advantage of exception which can or may be had or taken to the many errors, uncertainties, and other imperfections in the said petitioner's said bill of complaint contained, for answer thereto, or unto so much and such parts thereof as this defendant is advised is or are material or necessary for it to make answer unto, this defendant for answer says:

I. This defendant admits that it is a corporation organized under the laws of the State of New York, with its offices and place of business at Rochester, New York, and says that it was organized in 1908. It admits that its president is defendant Sidney W.
1339 Winslow, and that its issued capital stock is twenty-five thousand dollars ($25,000) at par, as set forth on page 6 of said bill of complaint.

II. Further answering, this defendant says that it is engaged in the manufacture of a machine known as the "Booth Impression Stitch Burnishing Machine," a "wheeling machine," and a "fudge stitch machine," which it sells exclusively to the United Shoe Machinery Company, of New Jersey. That in addition it manufactures machines known as the "Columbia Beader," "Victor Beader,"

"Sandal Snipper," and an ink shaking device, which this defendant sells either directly to consumers or to the United Shoe Machinery Company, of New Jersey.

III. This defendant denies every allegation, item, and particular of the petitioner's bill of complaint as fully and specifically as if each allegation were in terms specifically denied, and particularly denies each and every allegation, item, and particular contained in the first twelve sections of petitioner's bill of complaint, contained on pages 1 to 83, inclusive, of said bill of complaint, except so far as any of the same are hereinbefore expressly admitted.

IV. Further answering, this defendant expressly denies that it ever combined, contracted, and conspired with any person, firm, or corporation mentioned in said bill of complaint, or with any other person, firm, or corporation, to restrain interstate and foreign trade and commerce in shoe machinery used in the manufacture of boots and shoes or in any other business; or that it ever monopolized or attempted to monopolize said interstate trade and commerce or said foreign trade and commerce.

And this defendant denies all and all manner of unlawful combination and confederacy wherewith it is by said bill charged, without this, that there is any other matter, cause, or thing in the said petitioner's said bill of complaint contained material or necessary for this defendant to make answer unto and not herein and hereby well and sufficiently answered, confessed, traversed, and avoided or denied, is true, all which matters and things this defendant is ready and willing to aver, maintain, and prove as this honorable court shall direct, and humbly prays to be hence dismissed,
1340 with its reasonable costs and charges in this behalf most wrongfully sustained.

Answer of defendant W. W. Cross & Company (Inc.).

[Filed April 1, 1912.]

This defendant now, and at all times hereafter, saving and reserving unto itself all benefit and advantage of exception which can or may be had or taken to the many errors, uncertainties and other imperfections in the said petitioner's said bill of complaint contained, for answer thereto, or unto so much and such parts thereof as this defendant is advised is or are material or necessary for it to make answer unto, this defendant for answer says:

I. This defendant admits the following allegations of Section I of the petitioner's bill, on page 4 thereof, to wit, that it is a corporation organized under the laws of the State of Maine, with its

offices and places of business in Brockton, Massachusetts, and that its president is defendant Sidney W. Winslow, and that the amount of its issued capital stock is as set forth on said page 4 of said bill.

II. Further answering, this defendant says that it is engaged in the manufacture of tacks and nails, at Brockton, Massachusetts, and sells in the State of Massachusetts practically its entire output to the United Shoe Machinery Company, a corporation organized under the laws of the State of New Jersey, doing business in Massachusetts.

III. This defendant denies every allegation, item and particular of the petitioner's bill of complaint as fully and specifically as if each allegation were in terms specifically denied, and particularly denies each and every allegation, item and particular contained in the first twelve sections of petitioner's bill of complaint, contained on pages 1 to 83, inclusive, of said bill of complaint, except so far as any of the same are hereinbefore expressly admitted.

IV. Further answering, this defendant expressly denies that it is engaged in the manufacture, sale and shipment, in inter-
1341 state commerce, of said nails and tacks, or that it is engaged in interstate commerce at all, and expressly denies that it ever combined, contracted and conspired with any person, firm or corporation mentioned in said bill of complaint, or with any other person, firm or corporation, to restrain interstate and foreign trade and commerce in shoe machinery used in the manufacture of boots and shoes, or in any other business, or that it ever monopolized or attempted to monopolize said interstate trade and commerce, or said foreign trade and commerce.

And this defendant denies all and all manner of unlawful combination and confederacy wherewith it is by said bill charged, without this, that there is any other matter, cause, or thing in the said petitioner's said bill of complaint contained material or necessary for this defendant to make answer unto and not herein and hereby well and sufficiently answered, confessed, traversed, and avoided or denied, is true, all which matters and things this defendant is ready and willing to aver, maintain and prove as this honorable court shall direct, and humbly prays to be hence dismissed, with its reasonable costs and charges in this behalf most wrongfully sustained.

Answer of Defendant Xpedite Finishing Company.

[Filed April 1, 1912.]

This defendant now, and at all times hereafter, saving and reserving unto itself all benefit and advantage of exception which can or

may be had or taken to the many errors, uncertainties and other imperfections in the said petitioner's said bill of complaint contained, for answer thereto, or unto so much and such parts thereof as this defendant is advised is or are material or necessary for it to make answer unto, this defendant for answer says:

I. This defendant admits that it is a corporation organized under the laws of the State of Maine, with its offices and place of business at Boston, Massachusetts; that its president is defendant
1342 Sidney W. Winslow; that its issued capital stock is one million dollars ($1,000,000) at par, as set forth on page 3 of said bill of complaint.

II. Further answering, this defendant says that it is engaged in the business of leasing a machine known as the "Xpedite Finishing Machine," and tools to go with the same, to shoe manufacturers in the United States, under licenses under letters patent of the United States owned by it; said machines being used in the finishing of heels.

III. This defendant denies every allegation, item, and particular of the petitioner's bill of complaint as fully and specifically as if each allegation were in terms specifically denied, and particularly denies each and every allegation, item, and particular contained in the first twelve sections of petitioner's bill of complaint, contained on pages 1 to 83, inclusive, of said bill of complaint, except so far as any of the same are hereinbefore expressly admitted.

IV. Further answering, this defendant denies that it ever combined, contracted, and conspired with any person, firm, or corporation mentioned in said bill of complaint, or with any other person, firm, or corporation, to restrain interstate and foreign trade and commerce in shoe machinery used in the manufacture of boots and shoes, or in any other business, or that it ever monopolized or attempted to monopolize said interstate trade and commerce, or said foreign trade and commerce; and this defendant further says that if this defendant is engaged in interstate trade and commerce—which it denies—and has any monopoly of such trade or commerce—which it denies—then this defendant says any such monopoly is a valid and legal monopoly of such trade or commerce derived under and pursuant to and coextensive with letters patent of the United States.

And this defendant denies all and all manner of unlawful combination and confederacy wherewith it is by said bill charged, without this, that there is any other matter, cause, or thing in the said petitioner's said bill of complaint contained material or necessary for this defendant to make answer unto and not herein and hereby well and sufficiently answered, confessed, traversed, and
1343 avoided or denied, is true, all which matters and things this

defendant is ready and willing to aver, maintain, and prove as this honorable court shall direct, and humbly prays to be hence dismissed, with its reasonable costs and charges in this behalf most wrongfully sustained.

By its solicitor:

H. G. DONHAM.

Answer of defendant United Shoe Repairing Machine Company.

[Filed April 1, 1912.]

This defendant now, and at all times hereafter, saving and reserving unto itself all benefit and advantage of exception which can or may be had or taken to the many errors, uncertainties, and other imperfections in the said petitioner's said bill of complaint contained, for answer thereto, or unto so much and such parts thereof as this defendant is advised is or are material or necessary for it to make answer unto, this defendant for answer says:

I. This defendant admits the following allegations of Section I of the petitioner's bill, to wit, that it is a corporation organized under the laws of Maine, with its offices and place of business at Boston, Massachusetts, and that its president is defendant Sidney W. Winslow, and that the amount of its issued capital stock is fifty thousand dollars ($50,000) at par, as alleged in said Section I of said bill.

II. This defendant denies every allegation, item, and particular of the petitioner's bill of complaint as fully and specifically as if each allegation were in terms specifically denied, and particularly denies each and every allegation, item, and particular contained in the first twelve sections of petitioner's bill of complaint, contained on pages 1 to 83, inclusive, of said bill of complaint, except so far as any of the same are hereinbefore expressly admitted.

III. Further answering, this defendant says that it was organized in 1908, for the purpose of supplying the demand of cobblers for machines used in the repairing or cobbling of boots and shoes, and that since its organization in July, 1908, it has applied itself
1344 strictly to the business of supplying the demand of such cobblers for machines used in the repairing of boots and shoes. Its machines are for the most part covered by letters patent, and are leased to cobblers throughout the United States.

IV. Further answering, this defendant expressly denies that it ever combined, contracted, and conspired with any person, firm, or corporation mentioned in said bill of complaint, or with any other person, firm, or corporation, to restrain interstate and foreign trade and commerce in shoe machinery used in the manufacture of boots and shoes or in any other business; or that it ever monopolized or

attempted to monopolize said interstate trade and commerce or said foreign trade and commerce; and this defendant further says that if this defendant is engaged in interstate trade and commerce—which it denies—and has any monopoly of such trade and commerce—which it denies—then this defendant says any such monopoly is a valid and legal monopoly of such trade and commerce, derived under and pursuant to and coextensive with letters patent of the United States, owned by said United Shoe Machinery Company of New Jersey, from whom this defendant purchases its machines.

And this defendant denies all and all manner of unlawful combination and confederacy wherewith it is by said bill charged, without this, that there is any other matter, cause, or thing in the said petitioner's said bill of complaint contained material or necessary for this defendant to make answer unto and not herein and hereby well and sufficiently answered, confessed, traversed, and avoided or denied, is true, all which matters and things this defendant is ready and willing to aver, maintain, and prove as this honorable court shall direct, and humbly prays to be hence dismissed, with its reasonable costs and charges in this behalf most wrongfully sustained.

1345 *Answer of defendant O. A. Miller Treeing Machine Company.*

[Filed April 1, 1912.]

This defendant now, and at all times hereafter, saving and reserving unto itself all benefit and advantage of exception which can or may be had or taken to the many errors, uncertainties, and other imperfections in the said petitioner's said bill of complaint contained, for answer thereto, or unto so much and such parts thereof as this defendant is advised is or are material or necessary for it to make answer unto, this defendant for answer says:

I. This defendant admits that it is a corporation organized under the laws of the State of Maine, with its offices and place of business at Brockton, Massachusetts; that its president is defendant Sidney W. Winslow; and that its issued capital stock is two hundred thousand dollars ($200,000) at par, as set forth on page 4 of said bill of complaint.

II. Further answering, this defendant says that it is engaged in the business of manufacturing, selling, and leasing boot and shoe treeing machines, tree legs, tree feet, and other parts thereof, vamp-creasing machines, Miller breaking-in machines, Victor power irons, and electric and gas heated appliances used in the manufacture of boots and shoes, under letters patent of the United States, owned by it.

III. This defendant denies every allegation, item, and particular of the petitioner's bill of complaint as fully and specifically as if each allegation were in terms specifically denied, and particularly denies each and every allegation, item, and particular contained in the first twelve sections of petitioner's bill of complaint, contained on pages 1 to 83, inclusive, of said bill of complaint, except so far as any of the same are hereinbefore expressly admitted.

IV. Further answering, this defendant expressly denies that it ever combined, contracted, and conspired with any person, firm, or corporation mentioned in said bill of complaint, or with any other person, firm, or corporation, to restrain interstate and foreign trade and commerce in shoe machinery used in the manufacture of
1346 boots and shoes or in any other business; or that it ever monopolized or attempted to monopolize said interstate trade and commerce or said foreign trade and commerce; and this defendant further says that if this defendant has any monopoly of interstate trade or commerce—which it denies—then this defendant says that any such monopoly is a valid and legal monopoly of such trade or commerce, derived under and pursuant to and coextensive with letters patent of the United States owned by it.

And this defendant denies all and all manner of unlawful combination and confederacy wherewith it is by said bill charged, without this, that there is any other matter, cause, or thing in the said petitioner's said bill of complaint contained material or necessary for this defendant to make answer unto and not herein and hereby well and sufficiently answered, confessed, traversed, and avoided, or denied, is true, all which matters and things this defendant is ready and willing to aver, maintain, and prove as this honorable court shall direct, and humbly prays to be hence dismissed, with its reasonable costs and charges in this behalf most wrongfully sustained.

Answer of defendant United Shoe Machinery Company, of Maine.

[Filed April 1, 1912.]

This defendant now, and at all times hereafter, saving and reserving unto itself all benefit and advantage of exception which can or may be had or taken to the many errors, uncertainties, and other imperfections in the said petitioner's said bill of complaint contained, for answer thereto, or unto so much and such parts thereof as this defendant is advised is or are material or necessary for it to make answer unto, this defendant for answer says:

I. This defendant admits that it is a corporation organized under the laws of the State of Maine, with its offices and place of business at Boston, Massachusetts; that defendant Sidney W. Winslow is its president; and that its issued capital stock is three million dollars ($3,000,000) at par, as set forth on page 3 of said bill of complaint.

II. Further answering, this defendant says that the greater part of its business consists in the leasing and licensing under letters patent of the United States of machines used in the manufacture of boots and shoes to shoe manufacturers engaged in business in various States of the United States.

III. This defendant denies every allegation, item, and particular of the petitioner's bill of complaint as fully and specifically as if each allegation were in terms specifically denied, and particularly denies each and every allegation, item, and particular contained in the first twelve sections of petitioner's bill of complaint, contained on pages 1 to 83, inclusive, of said bill of complaint, except so far as any of the same are hereinbefore expressly admitted.

IV. Further answering, this defendant denies that it ever
1349 combined, contracted, and conspired with any person, firm, or corporation mentioned in said bill of complaint, or with any other person, firm, or corporation, to restrain interstate and foreign trade and commerce in shoe machinery used in the manufacture of boots and shoes, or in any other business, or that it ever monopolized or attempted to monopolize said interstate trade and commerce, or said foreign trade and commerce; and this defendant further says that if this defendant is engaged in interstate trade and commerce—which it denies—and has any monopoly of such trade or commerce—which it denies—then this defendant says any such monopoly is a valid and legal monopoly of such trade or commerce derived under and pursuant to and coextensive with letters patent of the United States.

And this defendant denies all and all manner of unlawful combination and confederacy wherewith it is by said bill charged, without this, that there is any other matter, cause, or thing in the said

petitioner's said bill of complaint contained material or necessary for this defendant to make answer unto and not herein and hereby well and sufficiently answered, confessed, traversed, and avoided or denied, is true, all which matters and things this defendant is ready and willing to aver, maintain, and prove as this honorable court shall direct, and humbly prays to be hence dismissed, with its reasonable costs and charges in this behalf most wrongfully sustained.

By its solicitor:

H. G. DONHAM.

Answer of defendant Edward N. Chase.

[Filed April 1, 1912.]

This defendant now, and at all times hereafter, saving and reserving unto himself all benefit and advantage of exception which can or may be had or taken to the many errors, uncertainties, and other imperfections in the said petitioner's said bill of complaint contained, for answer thereto, or unto so much and such parts thereof as this defendant is advised is or are material or necessary for him to make answer unto, this defendant for answer says:

I. This defendant denies that the Ellis Lacer Company is a
1350 corporation organized under the laws of the State of Maine, with its offices and place of business at Boston, Massachusetts, and that this defendant is its president, as alleged on page 6 of said bill of complaint.

II. Further answering, this defendant denies that he is the president and director of the Ellis Lacer Company, as set forth on page 9 of said bill.

III. Further answering, this defendant says that the Ellis Lacer Company was a corporation organized under the laws of the State of Maine about the year 1903; that on or about the thirtieth day of September, 1911, pursuant to a vote of the majority of the stockholders of said corporation, at a meeting duly called for the purpose, this defendant, as president of said corporation, at that time filed in the Supreme Court of the State of Maine, sitting in and for the county of Kennebec, a petition for the dissolution of said corporation, alleging, among other things, that said corporation had no assets and no liabilities and was not doing business; and that thereafter such proceedings were had that on the twenty-ninth day of November, 1911, a decree of dissolution of said corporation was entered in said suit in said Supreme Court of Maine, sitting in and for said county of Kennebec; and that thereupon said corporation was dissolved.

IV. This defendant denies every allegation, item, and particular of the petitioner's bill of complaint as fully and specifically as if each allegation were in terms specifically denied, and particularly denies each and every allegation, item, and particular contained in the first twelve sections of petitioner's bill of complaint, contained on pages 1 to 83, inclusive, of said bill of complaint, except so far as any of the same are hereinbefore expressly admitted.

And this defendant denies all and all manner of unlawful combination and confederacy wherewith he is by said bill charged, without this, that there is any other matter, cause, or thing in the said petitioner's said bill of complaint contained material or necessary for this defendant to make answer unto and not herein and hereby well and sufficiently answered, confessed, traversed, and avoided or denied, is true, all which matters and things this
1351 defendant is ready and willing to aver, maintain, and prove as this honorable court shall direct, and humbly prays to be hence dismissed, with his reasonable costs and charges in this behalf most wrongfully sustained.

By his solicitor: H. G. DONHAM.

Replication to joint and several answer of defendants.

Sidney W. Winslow, William Barbour, Wallace F. Robinson, George W. Brown, Edward P. Hurd, John H. Connor, Louis A. Coolidge, Edwin P. Brown, Henry B. Endicott, Edmund LeB. Gardner, John H. Hanan, Elmer P. Howe, Joseph C. Kilham, George E. Keith, Rudolph Metz, Charles G. Rice, Alfred R. Turner, Samuel Weil, Frank Wood, William Woodward.

[Filed April 8, 1912.]

For replication to the joint and several answer of the defendants Sidney W. Winslow, William Barbour, Wallace F. Robinson, George W. Brown, Edward P. Hurd, John H. Connor, Louis A. Coolidge, Edwin P. Brown, Henry B. Endicott, Edmund LeB. Gardner, John H. Hanan, Elmer P. Howe, Joseph C. Kilham, George E. Keith, Rudolph Matz, Charles G. Rice, Alfred R. Turner, Samuel Weil, Frank Wood, and William Woodward, the United States of America says that the allegations of its petition are true, and that the defendants' joint and several answer as set forth is not true, and this the petitioner is ready to prove.

1357 *Motion for leave to dismiss as to certain defendants.*

[Filed April 16, 1912.]

And now comes the United States of America, petitioner in the above-entitled cause, and moves for leave to dismiss its petition as against the following parties named as defendants therein:

United Awl & Needle Company, United Fast Color Eyelet Company, S. A. Felton & Son Company, Campbell-Bosworth Machinery Company, Boston Blacking Company, J. C. Rhodes & Company (Inc.), The Rimmon Eyelet Company, S. O. & C. Corporation, Thomas G. Plant Company.

ASA P. FRENCH,
United States Attorney for the District of Massachusetts.
W. S. GREGG,
Special Assistant to the Attorney General.

Upon the foregoing motion the following order was entered the same day:

Apr. 16, 1912. DODGE, J.: Motion for leave to dismiss allowed and petition dismissed as against the following parties named as de-

fendants therein: United Awl & Needle Co., United Fast Color Eyelet Co., S. A. Felton & Son Co., Campbell-Bosworth Machinery Co., Boston Blacking Co., J. C. Rhodes & Co. (Inc.), The Rimmon Eyelet Co., S. O. & C. Corporation, and Thomas G. Plant Co.

1358 *Motion for appointment of a special examiner, April 20, 1912.*

And now comes the petitioner, and moves that Charles K. Darling, Esquire, of Boston, Massachusetts, be appointed a special examiner to take the testimony in the above-entitled cause.

ASA P. FRENCH,
United States Attorney for the District of Massachusetts.
W. S. GREGG,
Special Assistant to the Attorney General.

1359 *Notice to take testimony, April 26, 1912.*

The United States give notice that they desire evidence to be taken orally under the 67th rule in equity.

1360 *Docket entry of April 26, 1912.*

April 26, 1912. The United States gives notice that they desire evidence to be taken orally under the 67th rule in equity.

Order appointing examiner, April 26, 1912.

PUTNAM, J.: By agreement of parties Charles K. Darling, Esq., is hereby appointed special examiner to take evidence in this district under the sixty-seventh rule. The United States have four calendar months in which to take and file their proofs in chief. The respondents have four calendar months thereafter in which to take and file their proofs in answer, and the United States two calendar months thereafter in which to take and file their proofs in rebuttal.

1361 *Petitioner's protest against order of court prescribing private hearings in said cause.*

[Filed May 22, 1912.]

And now come the United States, petitioner in the above-entitled cause, and protest against and except to the order of a single judge of this honorable court in substance and effect that the public and the press shall be excluded from the hearings before the special examiner appointed by this court to take evidence in said cause, for the following reasons, namely:

First. Because the Attorney General of the United States having heretofore, to wit, on the twentieth day of May current, filed a cer-

tificate under the act of February 11, 1903, 32 St., 823, as amended, and copies thereof having been furnished by the clerk of said court to each of the circuit judges in this circuit, in accordance with the provisions of said act, this cause and all matters pertaining thereto thereupon became, and are, cognizable only by the special tribunal created by virtue of said act.

Second. Because the matters and issues involved in this petition are of great public importance, and the court has no jurisdiction to direct that they shall be kept from the public knowledge at any stage of the proceedings.

Third. Because, except only in the interest of public decency and morality, secret court proceedings are obnoxious to the administration of justice and to the principles of a free government.

Fourth. Because such an order is contrary to all precedent in causes in which the United States are a party, and especially
1362 in proceedings brought under the Sherman Act in which such hearings have invariably been fully open to the public, as, for example, in the Standard Oil case, the Tobacco case, the Bath Tub case, the Steel case, the Anthracite Coal case, the Steamship Trust case, and many others.

ASA P. FRENCH,
United States Attorney.
W. S. GREGG,
Special Assistant to the Attorney General.
EDWIN H. ABBOT, Junior.
Special Assistant U. S. Attorney.

1363 *Order that all further proceedings before the examiner cease until further order of court, May 22, 1912.*

PUTNAM, J: It is ordered, in view of the position taken by the United States that the power of a single judge ceases on filing a request for proceedings under the act of February 11, 1903, as amended by the act of June 25, 1910, that all further proceedings before the examiner cease until further order of court.

By the court:

CHARLES K. DARLING, *Clerk.*

1364 *Order of court designating three judges to sit in the case, May 28, 1912.*

Referring to the request of the Attorney General, filed on May 20, 1912, under the act approved June 25, 1910, chapter 428:

It appearing that Judge Schofield, circuit judge for this circuit, is, and will be, necessarily absent for an indefinite period by reason

of sickness, and the senior district judge regarding himself as disqualified, it is ordered, by the concurrence of Circuit Judges Colt and Putnam, that Honorable Arthur L. Brown, United States district judge for the District of Rhode Island, is assigned and designated to sit with said Circuit Judges Colt and Putnam in accordance with said statute and the request aforesaid.

It is further ordered that said judges, namely Circuit Judges Colt and Putnam and District Judge Brown, will hold the court, as required by the statute aforesaid and said request, at Boston at eleven o'clock on Tuesday, the eighteenth day of June next, or at such other time or times as may be hereafter designated, and at the time or times to which said sitting may be adjourned, for the purpose of hearing any matters proposed, or which may be proposed, by either of the parties in the case aforesaid.

By the court:

CHARLES K. DARLING, *Clerk.*

1365 *Docket entry of August 28, 1912.*

August 28, 1912. BROWN, J. (Colt, J., concurring; Putnam, J., sat at hearing, but did not participate in this opinion, having previously expressed an opinion on the question as a single judge): Opinion, the examiner will not, without the consent of both parties, allow the attendance of persons other than those mentioned in rule 67.

1366 District Court of the United States, District of Massachusetts.

UNITED STATES OF AMERICA, PETITIONER, *v.* UNITED SHOE MACHINERY COMPANY OF NEW JERSEY et al.	No. 301. In Equity.

Before Colt, Putnam, and Brown, JJ.

Opinion of the court, August 28, 1912.

BROWN, J: The United States, having given notice that it desires evidence to be taken orally under the 67th rule in equity, contends that the public and the press should be admitted to the proceedings wherein the depositions of witnesses are to be taken before the examiner.

It is urged that the public and press should be afforded an opportunity to attend and to hear whatever may be said upon the examination before it has been reduced to writing and signed by the witness and before the deposition is presented to the court. This contention is not supported by the citation of any authority and is so

contrary to the usual practice both at law and in equity that it might be summarily disposed of save for the statement of the United States attorney that in cases under the Sherman Act such a course has been followed. The cases cited by the United States which uphold the undisputed principle of publicity in trials and in judicial proceedings do not in the slightest degree support the contention of the
1367 United States, and afford no tssistance upon the question before us. This question is whether the public and the press should be admitted to the taking of depositions for use at a trial not then begun, but which is to take place in the future.

The question is easily solved upon a consideration of the essential difference between a trial or a judicial proceeding, held by an officer with judicial authority, and the merely preliminary step of taking depositions.

Equity rule 67 provides that the examination shall take place in the presence of the parties or their agents by their counsel or solicitors; that the depositions taken shall be reduced to writing by the examiner; that the testimony of each witness shall be read over to him and signed by him in the presence of the examiner and such of the parties or counsel as may attend, etc. The examiner may note objections, but he "shall not have the power to decide upon the competency, materiality, or relevancy of the questions." The original depositions, authenticated by the signature of the examiner, must be transmitted by him to the clerk of the court, to be there filed of record in the mode prescribed by Revised Statutes, sec. 865.

Rule 69 provides that upon the return of the commissions and depositions into the clerk's office, publication may be ordered by any judge of the court upon due notice to the parties, and further provides for publication by consent in writing of the parties.

The nature of this proceeding is well described in Wigmore on Evidence, sec. 1376 (2): "This process of securing in advance the evidential material for a trial is a part of the preliminary procedure of courts," etc.

It is also described by Wigmore in sec. 1331 as "testimony given extrajudicially before a specially authorized officer for the purpose of subsequent use at a trial. . . . In a deposition the testimony is the writing taken down by the officer and signed by the deponent. The officer's writing is not his report of the witness' oral deposition; there is only one testimonial utterance—the writing."

Mr. Wigmore refers also to the chancery practice, saying:
1368 "In this practice all testimony was taken in writing, and in the theory the testimony or deposition was the writing and nothing else."

The brief of the United States attorney asserts, "The right of the public is to hear testimony, and that is not accorded when it is

given merely the privilege to read it." It is also asserted, "There is a right of the public to hear what is being said in this case while it is being said."

It is quite apparent from what we have said that such a supposed right has never existed in the practice of the chancery courts, nor has such a right in respect to the taking of depositions ever existed at law. Both common law judges and juries are compelled to receive testimony in the form of written depositions, and upon such written testimony of witnesses whom they have never seen nor heard may make decisions as to the rights of parties.

The public has a right to such form of testimony as the law provides shall be received at trials at law or at hearings in equity or upon other judicial proceedings. If judges and juries may not object that they have not seen and heard the witness while he was testifying, the press and public may not object.

Furthermore, neither at law nor in equity does a deposition become evidence in a case until it is offered by one of the parties; until there is an opportunity for a judicial hearing as to its competency. A party in a cause has a right to the protection of the court in a judicial hearing. In the proceedings before an examiner such right is not afforded him. No question of right is submitted to the examiner, and under the provision of equity rule 67 and under the doctrine of Blease v. Garlington, 92 U. S., 1, 7, the examiner must take down all the examination in writing. The party has the right to have his exceptions noted and to file further exceptions when the deposition is filed in court. "The testimony is taken to be submitted to the court where the suit is pending, and all questions upon the evidence, its materiality and sufficiency, are to be determined by it, and after it by an appellate court. Nelson v. United States, 201 U. S., 92. The only opportunity for redress which the party has against improper or irrelevant testimony follows the filing of the deposition. If all is to be made public
1369 before it is reduced to final form in writing and before there is an opportunity for a hearing upon the propriety and competency of the testimony, all effective protection against scandal, impertinence, and irrelevancy is practically gone.

When justice is being administered by a judicial officer, the public is entitled to attend, save under exceptional conditions, with which we need not deal.

In Cowley v. Pulsifer et al., 137 Mass., 392, Mr. Justice Holmes considered the question of the policy of publicity, and marks the distinction between what takes place in open court and the filing in the clerk's office of a petition containing a written preliminary charge. Of such preliminary steps he said: "These do not con-

stitute a proceeding in open court. Knowledge of them throws no light upon the administration of justice."

Due process of law requires that the parties have an opportunity to be heard. For the court to enforce a rule that the public and the press shall have an opportunity to listen before the parties to the case have an opportunity to be heard would be a plain violation of elementary rules of fair play. The proceeding before the examiner lacks the essential element—an opportunity to be heard by a judicial officer and to submit questions of right to a judicial officer.

Furthermore, another essential difference is that upon a trial or judicial proceeding the rights of the parties are submitted for an adjudication. A party in equity ordinarily may dismiss his bill at any time before final hearing. Houghton v. Whitin Machine Co., 160 Fed. Rep., 227; Morton Trust Co. v. Keith, 150 Fed. Rep., 606. Under the view of the United States a bill may be filed, the testimony of hostile witnesses may be presented to an examiner, the public and the press may attend, and the complainant may then dismiss the bill, leaving the defendant no opportunity to reply or to procure an adjudication which will offset the injurious statements of witnesses. It is manifest from the nature of depositions, because they are not yet legal evidence and because the parties against whom they are taken have had no opportunity for a hearing, that the proper practice is that which has been uniformly observed. Equity Rule 69 expressly provides for publication either upon the order of a judge or by consent of parties, after the return of the depositions by the examiner.

1370

In Patterson v. Colorado, 205 U. S., 454, 462, it was said:

"The theory of our system is that the conclusions to be reached in a case will be induced only by evidence and argument in open court, and not by any outside influence, whether of private talk or public print. What is true with reference to a jury is true also with reference to a court."

Premature publication of proceedings before an examiner might make the author subject to proceedings for contempt. In Wigmore on Evidence, sec. 1836, the writer states that publication of proceedings may be prohibited, and "of palpably just grounds, there are at least two: First, that the proceeding is only a preliminary or ex parte one, and that a publication would therefore give an erroneous impression of the conduct of the parties; secondly, that conditions of popular emotion exist, amid which the publication before verdict rendered would tend to excite the public mind, to cause pressure upon the minds of the witnesses, the judge, and the jury, and thus to do injustice to one of the parties by preventing a fair and unbiased investigation of the facts."

If upon these grounds a court may stop the publication of proceedings which have actually taken place in open court, it would follow that the court, were it necessary, might prohibit by order the publication of preliminary proceedings before an examiner; but such order is not necessary, for the reason that by common understanding of the bar and bench the taking of depositions is a private and not a public proceeding.

Testimony at times must be taken out of court. Alexander v. United States, 201 U. S., 117. Trials are held at times and places appointed by law. Depositions may be prepared at times and places whereof no public notice is given by law or is required from the parties; at places not accessible to the public, and at places where there is no provision for the attendance of the public. The court is provided with officers for the preservation of order; the examiner, under ordinary conditions, is not so provided. Depositions are taken at death beds, in prisons, in remote and even foreign
1371 jurisdictions. They may be taken in many jurisdictions for a trial in another jurisdiction. Within a short time it has been reported in the public prints that depositions in cases under the Sherman Act have been taken at a room in the Parker House in Boston and at a room in the Narragansett Hotel in Providence. What truth there is in such reports we do not know, but they illustrate what may properly be done and is ordinarily done in the course of taking depositions, but what is entirely inconsistent with the contention that public policy requires the attendance of the press and the public.

The impropriety of the publication, pending the suit, of depositions so taken is manifest from what we have already said. It is evident that upon ordinary principles of fair play the examiner's office should not be used as a vehicle for spreading statements which have not been subjected to judicial test.

The fact that testimony orally delivered is often more satisfactory than testimony read from a document has no bearing upon the present question. The mere preference for testimony of this character yields to the considerations of convenience and necessity which justify the general law of depositions.

What is termed by Mr. Wigmore in sec. 1396 "demeanor evidence," while desirable, is not essential. If, in the course of a chancery suit, it is desirable to produce particular witnesses in open court in order that their demeanor may be observed, there is provision that the court may, in its discretion, "permit the whole, or any specific part of the evidence, to be adduced orally in open court on final hearing." See equity rules 67, 78.

The provision in these rules is an indication that oral proceedings before an examiner are regarded as essentially different from proceedings in open court. It is quite clear that the taking of deposi-

tions, either at law or in equity, is in no proper sense a trial or a part of a judicial trial, using the term to mean "that final examination and decision of matter of law as well as fact, for which every antecedent step is a preparation, which we commonly denominate the trial." Carpenter v. Winn, 221 U. S., 533, 538, 539; Hess v.
1372 Reynolds, 113 U. S., 73, 80; Carson v. Hyatt, 118 U. S., 289; Delaware County Commissioners v. Diebold Safe & Lock Co., 133 U. S., 473; Nelson v. United States, 201 U. S., 92; Cowley v. Pulsifer, 137 Mass., 392.

In Ex parte Milligan, 4 Wall., 121, it was said: "Every trial involves the exercise of judicial power."

That the public and press should be entitled to hear what is not yet evidence and what may never become evidence, before the court which is to try the case hears it, is an unprecedented and unreasonable proposition. The contention that judicial proceedings shall be held with open doors is not under dispute. The proposition that the taking of depositions by an examiner, who is merely a ministerial officer, is subject to the same rule is in our opinion manifestly erroneous.

To justify a departure from the general practice and from the requirements of the natural meaning of the equity rules of the Supreme Court, which have the force of statute, it is necessary for the United States, if unable to produce authority, to show some reasons for its position. It asserts merely the right of the public to hear testimony. The public will have that right when testimony is offered. The public interests are fully preserved from the fact that the trial in the present case must be conducted with open doors.

The defendants claim that the court is bound, as a matter of positive law, by the sixty-seventh and sixty-ninth equity rules, and that these rules mean that no one else shall be present at the taking of the testimony except the parties mentioned in the rules; that if these rules do not fully cover the question equity rule 90 applies. The contention that upon a proper construction of equity rule 67 the examination is to be private is directly supported by the decision of Jessel, master of the rolls, In re Western of Canada Oil, Lands and Works Company, L. R. 6 Chan. Div., page 109.

"The place where the examiner sits is not a public court, but a mere office. That was so before the judicature acts, and those acts, so far as I know, have made no change in his position, and his office remains a private office to this day.

"The 31st section of the act 15 & 16 Vict. c. 86, which is still in force for this purpose, provides that 'all witnesses to be examined by or before one of the examiners of the court, or by or
1373 before an examiner to be specially appointed by the court, * * * and such examination shall take place in the pres-

ence of the parties, their counsel, solicitors, or agents.' That must mean in the presence of the parties, their counsel, solicitors, or agents exclusively. It can not mean that the parties, their counsel, solicitors, or agents must be present. It can only mean that the examination shall take place in their presence if they choose to attend. Subject to this, it is a private examination.

"In my opinion, the public have no right whatever to go into the examiner's office, and the examiner has no discretion as to admitting them."

The language construed by the learned judge was substantially that of rule 67.

We may further notice that rule 13 of the Circuit Court contained the form of commission upon interrogatories at law or in equity. Among other things it is provided:

"You will not, without the consent of the parties in writing, permit any person except yourself to attend at the taking of any deposition, or to communicate with any witness, whilst giving his deposition, in relation to the subject matter thereof; except that you may permit to be present such disinterested person (if any) as you may think fit to appoint as a clerk to assist you in reducing the deposition to writing; and you will take such deposition in a place separate and apart from all other persons."

Certainly this is inconsistent with the existence of any supposed rule that the public has a right to hear what is being said, as distinguished from an opportunity to hear it read at the trial. In conclusion we may say: Is it not time enough for the public to know what the testimony is when the court knows what it is? Is it not enough for the public to receive testimony in the form in which the court must receive it?

The examiner will not, without the consent of both parties, allow the attendance of person's other than those mentioned in rule 67.

Judge Putnam sat at the hearing of this matter by this court assembled under the statute, but as he had expressed an opinion when the question involved was brought before him as a single judge, he deemed it proper to withdraw from expressing any further opinion.

1374 *Docket entry of March 18, 1913.*

March 18, 1913. PUTNAM, DODGE, and BROWN, JJ.: Dodge, J., sitting under the statute in place of Colt, J., who has resigned. Order striking out order appointing Charles K. Darling special examiner.

Motion and affidavits of United States to try the cause to be filed by Thursday, March 20, 1913. Hearing continued to Wednesday, March 26, 1913, at 10 a. m.

1375. *Motion for appointment of special master.*

[Filed March 20, 1913.]

Now comes the United States of America, by William S. Gregg, special assistant to the Attorney General, and move that an order be entered herein requiring that the testimony in the above-entitled cause be taken before a special master, for the reasons appearing in the annexed affidavit.

WM. S. GREGG,
Of Counsel for Petitioner.

Affidavit in support of motion.

William S. Gregg deposes and says that he is a special assistant to the Attorney General, and of counsel for the petitioner in the above-entitled cause;

That on December 12, 1911, the petition in the above-entitled proceeding was filed; answers and replications thereto have been duly filed, and the cause is at issue;

That on May 20, 1912, a certificate of the Attorney General was filed, in accordance with the provisions of the act of Congress approved February 11, 1903, known as the "expediting act," as amended by the act of Congress of June 25, 1910, requesting that the case be heard before not less than three judges, as required by said acts, and that on May 28, 1912, an order was entered by the court designating three judges to sit as a special tribunal;

That this proceeding will require the examination of a large number of witnesses for the petitioner alone (the exact number your affiant is unable to state at this time); it is possible that among the witnesses for the petitioner approximately eighty could be examined before the court, and that the testimony of the other witnesses, approximately thirty, would have to be taken by deposition, due to the fact that they live out of this district and more than one
1376 hundred miles from the place of holding court, namely, in the States of New York, New Jersey, Pennsylvania, Ohio, Wisconsin, Illinois, and Missouri;

That it will be necessary to cause the production and examination of a large number of voluminous contracts, books, accounts, and other documents;

That the present case is an exception in equity proceedings under the Sherman Anti-Trust Act, in that there is involved thousands of letters patent in connection with which it may become necessary to produce expert testimony, which alone may occupy many weeks;

That equity proceedings brought under the Sherman Anti-Trust Act, wherein the United States is complainant, and wherein the Attorney General has filed a certificate, as authorized by said expediting act, and wherein a court of at least three judges has been constituted, are different from other equity proceedings in that the time of three judges instead of one will be occupied in hearing testimony;

That the interests of all of the parties to this proceeding would appear to be amply protected and the time of the court saved by a reference of the cause to a special master to take all of the testimony and report to the court.

WM. S. GREGG.

1377 Personally appeared before me William S. Gregg, who makes oath that the matters recited in the foregoing affidavit are true to the best of his information and belief.

Sworn to and subscribed before me this twentieth day of March, 1913.

[SEAL.] CHARLES K. DARLING,
Clerk U. S. District Court.

1378 *Application for leave to withdraw motion for appointment of special master.*

[Filed March 26, 1913.]

Now come the United States of America, by William S. Gregg, special assistant to the Attorney General, and requests leave of the court to withdraw the motion and affidavit filed with the clerk on March 20th, 1913, for the appointment of a special master to take testimony in the above-entitled cause.

WM. S. GREGG,
Of Counsel for Petitioner.

March 26, 1913.

PUTNAM, DODGE & BROWN, JJ. Ordered, there being no objection, the application of the United States for leave to withdraw its motion for appointment of special master is allowed without prejudice.

Attest:

CHARLES K. DARLING, *Clerk.*

1379 *Docket entry of March 26, 1913.*

March 26, 1913. PUTNAM, DODGE & BROWN, JJ. Ordered, there being no objection, the application of the United States for leave to withdraw its motion for appointment of special master is allowed without prejudice.

1380 *Petitioner's motion that the cause be set down for hearing.*

[Filed May 13, 1913.]

And now comes the United States of America, petitioner, and moves that the above-entitled cause be set down for hearing by the court for some date on or about the twenty-seventh day of May, current, and thereafter proceeded with continuously, or substantially so, upon regular court days until the taking of testimony by all parties shall have been completed.

ASA P. FRENCH,
United States Attorney.
WM. S. GREGG,
Special Assistant to the Attorney General.

1381 *Petitioner's alternate motion that the cause be set down for hearing before an examiner.*

[Filed May 13, 1913.]

And now comes the United States of America, petitioner, and without waiving its prior motion, filed herewith, moves, in the event that said prior motion is not allowed, that the above-entitled cause be referred to an examiner, under equity rule 47, to take the testimony therein beginning on or about the twenty-seventh day of May, current, and that the taking of said testimony be thereafter proceeded with continuously, or substantially so, until the taking of the testimony by all parties shall have been completed.

In support of this motion, the petitioner files the affidavit hereto annexed.

ASA P. FRENCH,
United States Attorney.
WM. S. GREGG,
Special Assistant to the Attorney General.

Affidavit in support of motion.

William S. Gregg deposes and says that he is a special assistant to the Attorney General and of counsel for the petitioner in the above-entitled cause:

That on December 12, 1911, the petition in the above-entitled proceeding was filed; answers and replications thereto have been duly filed, and the cause is at issue;

That on May 20, 1912, a certificate of the Attorney General was filed, in accordance with the provisions of the act of Congress approved February 11, 1903, known as the "expediting act," as amended by the act of Congress of June 25, 1910, requesting that

the case be heard before not less than three judges, as required
1382 by said acts, and that, on May 28, 1912, an order was entered by the court designating three judges to sit as a special tribunal:

That this proceeding will require the examination of a large number of witnesses for the petitioner alone (the exact number your affiant is unable to state at this time); it is possible that among the witnesses for the petitioner, approximately eighty, could be examined before the court, and that the testimony of the other witnesses, approximately thirty, would have to be taken by deposition, due to the fact that they live out of this district, and more than one hundred miles from the place of holding court, namely, in the States of New York, New Jersey, Pennsylvania, Ohio, Wisconsin, Illinois, and Missouri;

That it will be necessary to cause the production and examination of a large number of voluminous contracts, books, accounts, and other documents:

That the present case is an exception in equity proceedings under the Sherman Anti-Trust Act, in that there is involved thousands of letters patent in connection with which it may become necessary to produce expert testimony which alone may occupy many weeks;

That equity proceedings brought under the Sherman Anti-Trust Act, wherein the United States is complainant, and wherein the Attorney General has filed a certificate, as authorized by said expediting act, and wherein a court of at least three judges has been constituted, are different from other equity proceedings, in that the time of three judges instead of one will be occupied in
1383 hearing testimony;

That the interests of all the parties to this proceeding would appear to be amply protected, and the time of the court saved, by a reference of the cause to an examiner to take all of the testimony and report to the court.

WM. S. GREGG.

Personally appeared before me William S. Gregg, who makes oath that the matters recited in the foregoing affidavit are true to the best of his information and belief.

Sworn to and subscribed before me, this thirteenth day of May, 1913.

[SEAL.] JOHN E. GILMAN, Jr.,
Deputy Clerk, U. S. District Court, Dist. of Mass.

1384 *Docket entry of May 13, 1913.*

May 13, 1913. PUTNAM, DODGE & BROWN, JJ.: On motion for hearing of case in open court, ordered that case be assigned for hearing on Tuesday, May 20, 1913, at 10 a. m.

1385 *Defendants' motion for a bill of particulars.*

[Filed May 28, 1913.]

Now comes the several defendants and severally set forth that section six of said petition, headed "Other unfair and monopolistic acts of defendants," is couched in such general language and contains such vague and insufficient statements as to afford no information to the court and to these defendants of any specific acts complained of; that under rule 20 of the new equity rules of 1912, adopted by the Supreme Court of the United States, it is provided that further and better particulars of any matter stated in any pleading may be ordered by the court upon such terms as to costs or otherwise as may be just.

Wherefore, in view of the vagueness, insufficiency, generality, and indefiniteness of said section six of said bill of complaint, set forth at page 26 thereof, these defendants severally move that the United States be required to file forthwith such further and better particulars of the matters stated in said section six shall apprise the court of the claim made by the United States, and so that these defendants may know what things they have to meet in regard thereto, and with what they are charged.

CHARLES F. CHOATE, Jr.,
For Defendants.

1386 *Petitioner's response to defendants' motion for a bill of particulars, under Section VI of the petition, in the above-entitled cause.*

[Filed June 25, 1913.]

Responding to the motion of defendants for a bill of particulars, and the order of the court thereon, under Section VI of the plaintiff's petition, the following statement is filed in amplification of said section:

I.—Misrepresentation and threats to induce customers of competitors to abandon competing machinery.

a. The defendants or their agents have threatened to and have actually removed their leased machinery from factories where the machinery of competitors was being operated, the parties against whom said threats were made, when and where made, and the kinds of machines removed, and the kinds of competing machines which had been obtained, and from whom obtained, being as follows:

(1) Peter Tessier & Company, in or about March, 1904, in Haverhill, Massachusetts; machines removed being slugging machines, Goodyear welt and turn shoe machines, Grip slugging machines, Universal slugging machines, knife grinder, Goodyear turn channelers, and a Goodyear molding machine; the independent machine operated by Tessier & Company being a Duplessis turn sewing machine.

(2) Ernest Bottomley & Company, in or about January, 1904, at Haverhill, Massachusetts; machines removed being single head taper nail tacking machine, loose nailing machine, grip slugging machine, McKay knife grinder, American lightning nailing machine, McKay heel trimming and randing machine, McKay rotary grinder, Planet sole rounder; and the independent machine operated by Bottomley & Company being a Duplessis welt and turn machine.

b. The defendants or their agents threatened to remove, under the terms of their leases, their machines which were being operated by the following parties:

1387 (1) Mark J. Worthley, of Lynn, Massachusetts; Joseph Caunt, of Lynn, Massachusetts; Thomas G. Plant Company, of Boston, Massachusetts; A. E. Little Company, of Lynn, Massachusetts, and A. Garside & Sons, of New York City, because said individuals and firms were each operating in their factories or had obtained machines from the Standard Shoe Machinery Company. The petitioner is not informed as to the exact dates said threats were made, but is advised that they occurred in 1900 or 1901.

(2) In 1902 or shortly prior thereto, C. B. Lancaster Shoe Company, of Keene, New Hampshire, installed on trial in its factory a tackless lasting machine manufactured by the Tackless Shoe Machinery Company, whereupon the defendant United Shoe Machinery Company gave notice that if such machine was not returned forthwith, it would remove all of its machinery with which the factory of said Lancaster Shoe Company was almost entirely equipped, and as a result thereof said tackless lasting machine was returned and not purchased or leased.

(3) About the same time, Nutt & Pratt, of Natick, Massachusetts, whose factory was equipped with machinery leased from the United Shoe Machinery Company, also installed on trial one of said tackless lasting machines, but returned the same in consequence of a notice given by the United Shoe Machinery Company of like character to that it gave to C. B. Lancaster Shoe Company.

c. The defendants threatened to take back their machines under the terms of their leases and thereby force manufacturers to remove competing machines which had already been installed in the following instances:

(1) They so threatened T. D. Barry Shoe Company at Brockton, Massachusetts, in or about the spring or summer of 1900, and brought a proceeding to remove from said company's factory welting, stitching, heeling, lasting, slugging, insole channeling, and other machines, and thus compelled said company to remove a system of machines of like character, except slugging and channeling machines, which Barry & Company had obtained from the Standard Shoe Machinery Company.

(2) They so threatened Curtis & Jones, of Reading, Penn-
1388 sylvania, in or about the year 1903, and thus caused them to remove from their factory a full or nearly full line of machines which had been leased or purchased from the Duplessis Shoe Machinery Company.

d. Hilliard & Tabor, of Haverhill, Massachusetts, had installed a line of shoe machinery belonging to the United Shoe Machinery Company, and were operating the same. Early in 1911 said company installed a turn sewing machine manufactured by the Haverhill Shoe Machinery Company. Shortly thereafter, defendant Winslow, acting for the United Shoe Machinery Company, pointed out to Hilliard & Tabor that this machine was being operated in violation of the Shoe Machinery Company's leases, and threatened to change the terms of said leases and make them more onerous if said machines should be purchased and permanently installed; in consequence of which Hilliard & Tabor refused to purchase said machines.

e. In or about the year 1909 Harsh-Edmonds Shoe Company, of Milwaukee, Wisconsin, desired to lease one or more clicking machines, but on account of the burdensome conditions of the leases of the United Shoe Machinery Company they made an effort to obtain them from other parties. Shortly thereafter Mr. Harsh, while in Boston, was sent for by Mr. Willson, general manager of the United Shoe Machinery Company, and was warned and threatened by him with reference to his making further effort to procure such machines elsewhere, and was caused thereby to take clicking machines from the United Shoe Machinery Company.

f. Witherell & Dobbins, of Haverhill, Massachusetts, were engaged in the manufacture of turn shoes and were contemplating entering upon the manufacture of welt shoes, and in or about the spring of 1911 they were threatened by the United Shoe Machinery Company or its agents that if they continued to operate machines of competitors in the manufacture of turn shoes, they would exact from said Witherell & Dobbins installation charges on machines used in the manufacture of welt shoes, which charges were exorbitant in comparison with those rendered to manufacturers not operating competing machines.

1389 g. About the same time George A. Learned, of Newburyport, Massachusetts, was also engaged in the manufacture of turn shoes, and was contemplating entering upon the manufacture of welt shoes, and a threat of like character was made to said company by defendant shoe machinery company or its agents.

h. About June, 1911, Harry H. Wentworth, of Haverhill, Massachusetts, who was engaged in the manufacture of shoes, determined to install a heeling machine or machines manufactured by the Haverhill Shoe Machinery Company, but he was induced not to install said machines by representations on the part of the United Shoe Machinery Company or its agents that if he should do so said United Shoe Machinery Company would increase its installation charges upon future orders for machines, but that no additional charges would be made if orders were not placed with its competitors.

i. In certain conferences held in St. Louis in February, 1911, and in Boston in May, 1911, between Sidney W. Winslow, president of the United Shoe Machinery Company, and Jackson Johnson, Milton S. Florsheim, Frank C. Rand, Emanuel F. Selz, and other shoe manufacturers located in the Central West, said Winslow threatened said manufacturers that the United Shoe Machinery Company would enter upon the shoe manufacturing business, this threat being made in connection with efforts made by said manufacturers to procure a modification of the provisions in the United Shoe Machinery leases.

II.—Threats to use financial resources and power of combination to ruin competitors.

a. In 1900 and previous thereto the Standard Shoe Machinery Company was engaged in the manufacture of shoe machinery, and was endeavoring to perfect and place upon the market, in competition with the United Shoe Machinery Company, a full line of shoe machinery. In or about the spring of said year William Barbour, a director of, and acting power of, the United Shoe Machinery Company, arranged for a conference with James N. Darrah, an officer of said Standard Shoe Machinery Company, the object of said
1390 conference being to negotiate the purchase by the United Shoe Machinery Company of the properties and stock of said Standard Company. Said conference was had at the office of John R. Dos Passos. In the conference then held said Barbour said in substance the following:

"Well, you are making a big mistake because we always try to be nice to people—we offer to buy them at first and then we crush. You cannot do anything, because we control the banking influences both in New York and Boston, and you would not be able to get any money. You won't put in your machines because we have the shoe

manufacturers in a state of terror. I own a million dollars of that stock, and we can't afford to have any competition. My investment is liable to be jeopardized and we can't afford to have any competition against the United Shoe Machinery Company. We have the field and we are going to retain that field."

Thereafter and after the Standard Shoe Machinery Company had suspended operations, said Darrah, in 1905, had a talk with said Barbour, in which he, Darrah, remarked that he had thought of going back into the shoe machinery business, to which Barbour replied in substance:

"You would make a big mistake because you would never get in. We will never let you in or anyone else. You will never have a chance to get in. You will never be able to place your machinery with shoe manufacturers. You can't find any customers."

b. In 1908, and prior thereto, Richard H. Long, of South Framingham, Massachusetts, was engaged to some extent in the manufacture and sale of shoe machinery in competition with the United Shoe Machinery Company, and was endeavoring to increase his business along that line. In or about said year, for the purpose of enabling him to prosecute said business more successfully, he endeavored to arrange for a line of credit with the Chapin National Bank, of Springfield, Massachusetts, but was prevented from doing so by and through the influence of the United Shoe Machinery Company. About the same time he was offered a credit of $50,000 by the New England National Bank, but was subsequently refused the same through the influences brought to bear by the defendants.

1391 c. About 1908 one Bayley, an officer of high rank in the United Shoe Machinery Company, stated to J. S. Holt, who was then endeavoring to manufacture and sell shoe machinery in competition with the United Shoe Machinery Company, and for the purpose of intimidating said Holt, that the said Richard H. Long would be ruined and driven from business by the United Shoe Machinery Company unless he ceased trying to compete with this company, and that the same fate would befall any other who tried to enter the shoe machinery industry, and that said company would make every effort to ruin Long by destroying his credit with the banks, pointing out that the United Shoe Machinery Company controlled the First National Bank of Boston, one of the largest and most powerful financial institutions in New England, and possessed such strong banking connections that it would be able to prevent Long from obtaining the necessary capital to continue operations.

d. In 1904 and previous thereto Harry E. Cilley, of Rindge, New Hampshire, was engaged in making shoe machinery, principally Judd

leveling machines. In 1901 negotiations were being had between said Cilley and the United Shoe Machinery Company, through E. P. Hurd. During the negotiations Cilley was asked if he would accept $30,000, which was declined. Hurd then said in substance that Cilley could not do any business except by the sufferance of the United Shoe Machinery Company and that he was slow-witted if he did not appreciate it; that the United Shoe Machinery Company controlled all the manufacture of welt shoes and intended to control the manufacture of McKay sewed shoes, and that the control of the upper stitching process might be acquired; that the United Shoe Machinery Company did not care for either the common law or the Sherman law, that they could retain attorneys of reputation, and their money practically could control any suit started against them, and further that at the formation of the United Shoe Machinery Company constituent companies had its machines in factories, the removal of which by the United Shoe Machinery Company at that time would have put a shoe manufacturer out of business, since
1392 which time the shoe manufacturers, through threats of litigation and possible attacks upon credits, have been at the mercy of the combination.

e. Tower Brothers have been engaged at Hudson, Massachusetts, in manufacturing shoe machinery and placing the same upon the market in competition with the United Shoe Machinery Company. Said company's business was greatly injured by their employees being taken away to work in the factory of the United Shoe Machinery Company, they being induced to do so by agents of said company. On or about 1900 one Timothy Bresnahan, acting as agent for the United Shoe Machinery Company, under special authority given by said company, endeavored to purchase the property and business of said Tower Brothers, and made a proposition for the same, which was refused. Thereupon Bresnahan, acting for said defendant company, threatened to drive Tower Brothers from business by quoting such ruinously low prices that they could not possibly compete, at the same time informing said Tower Brothers that the object of the Shoe Machinery Company was to secure complete control of the edge-trimming or edge-cutting machine business.

f. Charles H. Morse, of Brookline, Massachusetts, was formerly engaged in the business of shoe machinery manufacture. In 1903, while said Morse was endeavoring to market the machine known to the trade as the "Frechette" pegging machine and a slugging machine which competed with the United Shoe Machinery Company machines for doing similar work, President Winslow requested said Morse to call at his office, at which time Winslow stated in substance: "You don't suppose we are going to let you continue placing that machine upon the market."

g. George H. Clark, of Winthrop, Massachusetts, an inventor of machines used in the manufacture of shoes, had invented a method of molding or lasting a shoe and stitching the same on the last on which it was molded, the edge being trimmed at the same time at a suitable distance from the edge of the last to enable the outer sole to be attached thereto.

Clark endeavored to introduce this method of manufactur-
1393 ing a molded shoe into various shoe factories, and particularly in the factory of E. B. Richardson, Reading, Massachusetts.

Clark visited the offices of the United Shoe Machinery Company in this connection about 1910 and endeavored to procure by purchase, lease, or rental a Goodyear rapid lock-stitch machine for use in the Richardson factory. Edward P. Hurd, a director and member of the executive committee and assistant treasurer of the United Shoe Machinery Company, at that time told Clark in substance:

"Our policy is to stick the knife in deep to the hilt in the case of anyone interfering with our system, and surely your method does interfere. We will never let you have a machine or have one used in any factory where you or your method may be found, for you to experiment with."

h. Irving A. Hadley and Herbert L. Kimball, doing business under the firm name of Kimball & Hadley, were engaged at Lynn, Massachusetts, in the manufacture of needles, awls, and drivers, and placing the same among shoe manufacturers in competition with the United Shoe Machinery Company.

The United Shoe Machinery Company, through its representatives, notified the shoe manufacturers that if they purchased and used needles and awls from said Kimball & Hadley, the United Company would withdraw its machines from their factories. And in a meeting with Charles W. Martin, assistant to Manager C. H. Bailey, of the United Shoe Machinery Company needle department, about 1903, Hadley was told in substance that the United Company would have his business sooner or later, and that he had better go in and see Mr. Bailey. Hadley afterwards visited said Bailey, as a result of Martin's suggestion, and was told by the latter that if necessary the United Company could give its needles away, in order to destroy the business of Kimball. In the fear that their business would be absolutely destroyed, Kimball & Hadley sold out to the United Shoe Machinery Company.

i. About 1904 the defendants entered into negotiations with Samuel A. Krewson, of Pensauken, New Jersey, an inventor of shoe machinery, with a view to purchasing his inventions. During
1394 a conference with Mr. E. L. Hurd, of the United Company Krewson was told in substance that he owned nothing but what the United Company could make—referring particularly to

Krewson's scouring and fudge wheeler machines. Krewson pointed out to Mr. Hurd that the United Company at that time had nothing like his device, and if it did put one on the market it would be equal to a duplication of his machines, to which Mr. Hurd replied in substance that the United Company could make scouring wheels and put them out by the thousand cheaper than Krewson could possibly do so. Krewson admitted that the United Company could do this, of course, but that it would lose money in so doing, to which Mr. Hurd replied in substance: "We do it to drive little fellows like you out of business." Mr. Hurd also stated to Krewson in substance that "You had better get out of the shoe machinery business," to which Krewson replied: "Would you have me breaking stone?" To which Hurd answered: "Well, I would do something else." At the same time Mr. Hurd remarked: "If we did buy anything, you would pop up again with something else," to which Krewson replied: "Wouldn't I have a right to pop up again?" Mr. Hurd replied: "That is just the trouble; we would have to buy you out again."

III.—Threats to prevent prospective competitors from entering business.

Specifications under this head are embraced in those given under Section II.

IV.—Acquisition of letters patent for valuable inventions—Withheld for long periods—To the detriment of manufacturers and the public.

a. From time to time, as patents have been issued upon various devices used in the manufacture of shoes and various attachments to shoe machinery, the defendants have systematically, for the purpose of preventing others from making a practical use of said patents in the manufacture of machines which would be sold or leased in competition with their machines, and for the purpose of
1395 further monopolizing the shoe machinery business to themselves, acquired said patents by purchase or otherwise, and after the acquisition, with but few exceptions, have suppressed the same, or have failed to make practical use thereof.

b. The defendants have, by suits and threats of suits, for alleged infringement of patents, used and employed patents covering mere details of construction, to prevent the manufacture, use, and sale of unpatented machines.

V.—Grant of rebates to manufacturers to effect exclusive use of machinery.

a. The defendants have granted, and are now granting, to exclusive users of their leased machinery and to such other shoe manu-

facturers upon such special terms as may be considered expedient, rebates of amounts equal to the sums paid by them, respectively, as royalty on Gem flexible insole machines of defendants during the period for which such rebates are made.

b. The defendants have granted a rebate of not less than 15 per cent on account of royalties received from their lessees of Goodyear welters and stitchers in the United States, and one of not less than 10 per cent on account of royalties from the use of Goodyear turn sewing machines, such rebate in each instance being received from a fund created by the investment by defendants each year in the common stock of the United Shoe Machinery Corporation, for three years, from January 1, 1910, to January 1, 1913, at the end of which period the said stock was to have been distributed among said lessees of defendants.

c. The defendants, on the other hand, have penalized, and have threatened to penalize, shoe manufacturers operating competing machinery by withdrawing the above mentioned rebates.

VI.—Purchase of business of competitors at exorbitant prices to eliminate competition.

a. The defendants have purchased the businesses of competitors and prospective competitors to eliminate competition, paying therefor, in many instances, exorbitant prices.

1396 VII.—Other unlawful acts.

a. The defendants have been instrumental in endeavoring to organize strikes and other labor disputes in factories of shoe manufacturers wherein machinery of competitors was also operated.

(1) In or about May, 1910, disaffection arose among the employees in the shoe machinery factory of Thomas G. Plant, then in operation at Boston, Massachusetts. Through an employee of the United Shoe Machinery Company conferences with reference to said labor troubles in Plant's factory were held between one Frank Morrison, Abraham Sochat, and Charles G. Ross, representing Plant's employees, and Charles H. Willson, then general manager of the United Shoe Machinery Company. In one of such conferences in or about June, 1910, said Willson assured Morrison and others that if they would form an organization among the employees of the Plant factory for the purpose of causing a strike therein, all expenses would be paid by the United Shoe Machinery Company, and that the leaders in the movement would be paid handsomely. Relying upon said representation, Morrison and others began to form such organization in accordance with instructions from Willson, and through their efforts about

three hundred operatives were brought within the union. But Plant, becoming suspicious, employed detectives to watch the movements of Morrison and his associates, and a strike in his factory was prevented. Said Morrison and his associates expended a large sum of money promoting said organization.

b. The defendants have taken into their employ officers and employees of competitors for the purpose of injuring their business, and have attempted to induce, hire, or bribe, and have induced, hired, and bribed, individuals to spy upon or betray the secrets of competitors in the following instances, to wit:

(1) In or about 1900 Charles H. Willson, representing the United Shoe Machinery Company, induced Solomon N. Cutter, who was under contract with said company, to go into the employ of the Standard Shoe Machinery Company, a corporation whose headquarters were at Boston, Massachusetts, the object of said
1397 Willson being to thus covertly obtain information as to the financial condition of said company and the state of its business, and afterwards endeavored to obtain from said Cutter information which said Cutter had received while in the employ of said Standard Company.

(2) The Harlow Shoe Finishing Machine Company is a corporation which has been for some time engaged in manufacturing especially the Harlow heel-burnishing machine, which competes with the Xpedite heel burnisher. In or about 1911, George H. Harlow, who was the president and a minority stockholder of said Harlow Shoe Finishing Machine Company—the person principally interested therein being E. E. Bartlett—was taken into the employ of the United Shoe Machinery.

(3) On or about June, 1910, one Richards and one Raymond, agents of the United Shoe Machinery Company at Lynn, Massachusetts, through Charles G. Ross and Abraham Sochat, employees at the Plant shoe factory at Boston, Massachusetts, induced a former expert laster at the Plant shoe factory to go to the P. J. Harney Shoe Company factory at Lynn, Massachusetts, where, under their supervision and in accordance with instructions from Charles H. Willson, general manager of the United Shoe Machinery Company, the said workman demonstrated a lasting machine invention operated in the Plant factory, using the lasting machine of the United Shoe Machinery Company as a model to illustrate the essential differences in operation between the said two machines.

(4) In 1910 and 1911 the Reece Buttonhole Machine Company, whose head office was in Boston, Massachusetts, was engaged in the manufacture of buttonhole machinery, and had in its employ Bernard T. Leveque, an inventor, and Charles M. Brown, a foreman. The United Shoe Machinery Company was then contemplating

entering upon the manufacture of buttonhole machinery and was experimenting for that purpose, and in order to injure the business of said Reece Buttonhole Machine Company it induced said Leveque and Brown to enter into its employ.

(5) In 1905 Charles P. Stanbon, doing business under the name of C. P. Stanbon & Company, was engaged at Lynn, Massachusetts, in manufacturing and selling stockfitting machinery in
1398 competition with the United Shoe Machinery Company, and said company was endeavoring to force said Stanbon to sell out his entire business. For the pørpose of accomplishing this object, the said United Shoe Machinery Company offered said Stanbon's employees higher wages and thereby induced one Horace Thompson, a special stock fitter, and other important employees of Stanbon to leave him and accept employment from said company.

c. The defendants have threatened to duplicate, and in numerous instances have duplicated, the inventions, patterns, and designs, patented and unpatented, of others and have used the same to their own advantage without proper payment therefor.

(1) In 1903 and previous thereto the Tripp Giant Leveler Compaay was engaged in the manufacture of a leveling machine. Said Leveler Company was controlled and owned by Charles H. Johnson and Maurice V. Bresnahan. About January of said year said Johnson and Bresnahan received a request from the United Shoe Machinery Company to enter into negotiations looking to the asquisition by said company of the Tripp Giant Leveler Company and another concern in which Bresnahan had an interest. At the first interview S. W. Winslow, president of said company, submitted a proposition to the effect that the business would be taken over at an appraised value for the tools and stock on hand, and that in lieu of payment for the Leveler Company's patents a commission was to be paid by the United Shoe Machinery Company on all Tripp Giant Leveler Company machines thereafter manufactured and sold, and a proposition was made embracing an offer for employment with the United Shoe Machinery Company for a period of ten years. When the contract was thereafter prepared and submitted, it materially differed from his proposition, and said Johnson refused to execute the same, and Bresnahan also refused. Thereupon Mr. Winslow said to Johnson in substance: "Johnson, you had better sign that contract. We are going to have your business any way." About six months thereafter the United Shoe Machinery Company began the manufacture of machines which were practically duplicates of the machines manufactured by the Tripp Giant Leveler Company.
1399 On account of the tremendous expense of patent litigation, it was considered inadvisable to institute legal proceedings to

prohibit the Shoe Machinery Company from further manufacturing same.

(2) Frank L. Harmon, of Beverly, Massachusetts, was an inventor of patent heeling machines, tacking and nailing machines, sewing machines, skiving and fulling machines, and shoe machinery of other kinds. In 1905 S. W. Winslow, president of the United Shoe Machinery Company, was endeavoring to purchase from said Harmon his patents on skiving and fulling machines, and in an interview said Winslow told Harmon that he would see to it that Harmon did not get any more money to work with. Winslow also said that he did not have to buy Harmon's machine; that he would rather have three machines do the work than one, because they would have more machines and more parts to make. Winslow further said that he could have Harmon's machines if he cared for them, and that Harmon could not prevent it, and said that Harmon could not prevent it, and said that Harmon was a fool not to have studied the power of money.

After Harmon had obtained a patent on a die block and for several years before same was assigned to the United Shoe Machinery Company said company manufactured and leased machines infringing said patent without any right whatever to do so, and without giving Harmon any compensation therefor.

One H. O. Woodbury furnished said Harmon money for experimentation, and while so engaged said Harmon invented and constructed a skiving machine. Said Woodbury negotiated with C. H. Willson, manager of the United Shoe Machine Company, and Willson said that if the patent was assigned to the company and the machine worked as represented, the company would pay for it a substantial sum. Trusting this representation, Woodbury assigned without present consideration, said patent, relying upon the oral understanding as stated. The company bought and tested said machine, which worked perfectly, but the company thereafter refused to pay any consideration for the patent.

(3) One Euclid I. LaChapelle in 1906 invented an appliance for holding uppers to soles during the sewing operation. Some
1400 time thereafter LaChapelle invented an improvement on the pulling-over machine, and also invented a machine for leveling the bottom of shoes, a welt guide, and many other improvements on other machines used in the manufacture of shoes. The United Shoe Machinery Company took said LaChapelle into its employ, upon representation that it would pay to him a reasonable consideration for said inventions when they should be developed by experimentation but said LaChapelle was subsequently purposely discharged from its employ, and many of said improvements have been perfected and

placed in operation, without any adequate consideration from the United Shoe Machinery Company.

(4) In or about November, 1903, one Nathaniel Sparks invented a heel compressing machine and assigned his invention to one William J. Young, but the patent was applied for in the name of said Sparks. Thereafter the United Shoe Machinery Company induced said Sparks to make an affidavit and file same at the Patent Office, denying that he had ever invented such machine. Subsequently the United Shoe Machinery Company began making machines under said invention, and said Young has never been able to realize any value therefrom.

(5) T. J. Edwards was engaged in the business of cutting stamps to be used in stamping shoes. In 1910 he was requested by the United Shoe Machinery Company to compile a catalogue of his stamp cuts, so that orders might be taken from said company by those desiring stamps. Understanding that the orders would be placed with himself, he compiled the catalogue, but received practically no orders through said company. Early in 1911 Edwards ascertained that the United Shoe Machinery Company had issued a catalogue of designs and distributed the same to all shoe manufacturers, in which it had included those which had been furnished by Edwards previously. The issuance of this catalogue practically ruined Edwards's business.

(6) The Fortuna Machine Company manufactures a skiving machine known as the Fortuna skiving machine. The United Shoe Machinery Company has for some years past been manufacturing a skiving machine which closely resembles the one manufactured
1401 by the Fortuna Company, and which it represents to the shoe manufacturers to be a Fortuna machine, and while it expresses willingness to said manufacturers to instal the same if they so desire, it discourages them from doing so, pretending that the machine is an inferior one. This is done in order to discredit the machine manufactured by the Fortuna Machine Company.

(7) About 1904 or 1905 one George E. Rollins invented a welt-grooving and champing machine and sold out two-thirds interest therein to Charles C. Merritt, of Brockton, and some machines manufactured thereafter were placed upon the market. After it was demonstrated that said machine was a success, the United Shoe Machinery Company, without any legal right whatever, began putting out a similar machine, which clearly infringed Rollins's patent, and placed same upon the market in competition with Rollins's machine, and destroyed the value thereof. Said Rollins has been deterred from litigation on account of the expense of same.

(8) In the spring of 1900 one A. McDowell invented a spring heel shaver, and looking to a purchase of this invention the United

Shoe Machinery Company carried on for a time negotiations with said McDowell. Thereafter said company informed McDowell that it had a machine for a like purpose of its own, which machine was in fact an infringement of McDowell's invention. Said McDowell also invented a heel seat cutter for trimming the heel seats of shoes on heel-shaving machines, upon which he obtained a patent in 1897, and he thereafter also procured a patent upon an adjustable independent background for heel seat cutters on shaving machines. The United Shoe Machinery Company has purposely produced machines embodying the patented features of each of the aforesaid patents, and thereby destroyed the value of the same, well knowing that said McDowell could not afford the expense of litigation against it.

d. The defendants have exacted royalties from various lessees among shoe manufacturers for work performed on machinery owned by such shoe manufacturers or furnished by competitors of defendants.

(1) On November 1, 1911, the defendants rendered a bill to
1402 Mr. Charles L. Clifford, who was engaged in the manufacture of children's turn shoes at Newton, New Hampshire, for 9,839 pairs of children's turns, sewed on a Fox (Haverhill) turn-sewing machine, at one cent per pair—or a total of $98.39, with a discount of fifty per cent (50%) if paid before November 15, 1911.

(2) About 1903 or 1904 Fred J. Thompson, of Haverhill, Massachusetts, shoe manufacturer, was using two stitching machines of the Duplessis Machinery Company. Later a line of machinery of the United Shoe Machinery Company was installed and Thompson was obliged to pay royalties to the United Company for all shoes manufactured by the Duplessis machinery.

e. The defendants have wrongfully exacted return charges from shoe manufacturers on leased machinery in instances where such charges did not properly apply.

f. The defendants have arbitrarily increased the installation, return, and other charges on machinery operated by shoe manufacture's who also operate machinery of competitors.

(1) N. D. Dodge Shoe Company, of Newburyport, Massachusetts, had greatly improved their work by the aid of the machines of the Haverhill Shoe Machinery Company, but were forced to discontinue their use when they went to the United Company for a welt line. The company would not put in the line unless they paid what would be a fair price for the machines when installed, and yet which gave them no equity in the machines, and they must then pay the same royalties as others who made no initial payment.

The United Company required them not only to discontinue the use of the sewing machines, but the channeling machines also.

g. The defendants have offered or granted special terms and prices to shoe manufacturers on machinery, parts, and supplies, at times below cost, to induce them to withdraw their business from competitors.

(1) About 1900, E. P. Reed Company, of Rochester, New York, were using machines of the Standard Shoe Machinery Company. The defendants offered to install their machines free of charge if the Reed Company would discontinue the use of Standard machines.

1403 h. The defendants have refused or delayed unnecessarily in furnishing machinery, parts, or supplies to shoe manufacturers also operating machinery furnished by competitors or owned by said shoe manufacturers.

i. The defendants have threatened to remove their leased machinery from factories wherein supplies purchased from competitors have been used.

j. The defendants have refused to furnish individual machines to shoe manufacturers operating machinery of competitors, such refusals being either absolute or modified by demands for prohibitive installation charges.

(1) About December, 1911, Carleton & Hunt, shoe manufacturers, Haverhill, Massachusetts, then manufacturers of turn and McKay shoes, were then using one sewing machine and channeling machine of the Haverhill Shoe Machinery Company. About that time they desired to engage in the manufacture of welt shoes and ordered a line of welt machinery from the defendants, and were informed by the defendants that they would have to discontinue the use of the Haverhill sewing machine before welt machinery could be installed. An alternative proposition, however, was made to Carleton & Hunt by the defendants to install welt machinery upon a payment of an installation charge, which was practically prohibitive, in addition to the regular royalty charges.

(2) About June, 1912, Ira J. Webster, shoe manufacturer, Haverhill, Massachusetts, who had been operating two Pettengill nailing machines which he owned outright, endeavored to obtain from the defendants a pulling-over machine and a toe-capping machine. In view of the fact that he was operating independent machinery, the defendants demanded an excessive installation charge on the pulling-over and toe-capping machines, in addition to the royalty charges, which Webster could not afford to pay. Webster then suggested his willingness to pay the regular royalty charges on the defendants' rapid heelers, in order to obtain the pulling-over and toe-capping machines from the defendants, provided he be allowed to continue operations on the Pettengill machines. He was unable to

1404 make any satisfactory arrangement with the defendants, and the Pettengill machines have been removed from his factory.

k. The defendants have threatened to take further steps to increase and perfect their control of the shoe machinery business, not only of the United States, but of the world.

J. A. FOWLER,
Assistant to the Attorney General.
WILLIAM S. GREGG,
Special Assistant to the Attorney General,
of Counsel for Petitioner.

STIPULATION.

[Filed July 23, 1913.]

It is hereby agreed and stipulated between counsel for all the parties that the demurrers of the following defendants:

Thomas G. Plant Company,
Rimmon Eyelet Company,
S. O. & C. Corporation,
Campbell, Bosworth Machinery Company,
United Fast Color Eyelet Company,
United Awl & Needle Company,
J. C. Rhodes & Company, Inc.,
Boston Blacking Company,

and the demurrer and answer of S. A. Felton & Son Company, need not be printed in the record, as the petition has been dismissed as to said defendants, by order of court, entered April 16, 1912.

W. S. GREGG,
Special Assistant to the Attorney General,
for Complainant.
CHARLES F. CHOATE, Jr.,
for Defendants.

1405 *Order of court directing the taking of testimony, with respect to patents, before an examiner, June 27, 1913.*

PUTNAM, BROWN, and DODGE, JJ. It is ordered that the taking of testimony, both for the peitioner and defendants, with respect to the allegations of the peition set forth in the paragraph beginning at the bottom of page 15 and ending at the beginning of Section IV on page 16, of the printed petition in the above-entitled cause, be, and is hereby, referred to Charles K. Darling, as special examiner; and that for the purpose of taking such testimony the petitioner

is allowed until August 12th, inclusive, to present its evidence in chief, and the defendants are allowed from that date until September 27th, inclusive, to present testimony in defence of the proofs presented by the petitioner before the examiner, and the petitioner is allowed from the last named date to October 11th, inclusive, 1913, to present evidence in rebuttal. The court reserves control of the proceedings before the examiner, so far as either party finds it necessary to protect their rights; and on any question as to the admission of proofs, either party may apply to the court.

By the court:

CHARLES K. DARLING, *Clerk.*

1406 *Order extending time for taking testimony before examiner under order dated June 27, 1913.*

[August 8, 1913.]

PUTNAM & DODGE, JJ. It is ordered (both parties consenting hereto) that the times for taking testimony under the order dated June 27, 1913, entitled "Order directing the taking of testimony with respect to patents before an examiner," be extended two (2) weeks, the petitioner to be allowed until August 26, 1913, inclusive, for evidence in chief, the defendants to have until October 11, 1913, inclusive, for testimony in defence, and the petitioner to have to October 25, 1913, inclusive, for rebuttal.

By the court:

CHARLES K. DARLING, *Clerk.*

The above-named parties hereby consent to the entry of the foregoing order.

ALLEN WEBSTER,
Special Assistant to the Atty. General
for Petitioner.
CHAS F. CHOATE, JR.,
for Defendants.

JULY 31, 1913.

1407 *Order extending time for taking testimony before examiner under order dated June 27, 1913.*

[September 12, 1913.]

PUTNAM, DODGE, & BROWN, JJ. It is ordered (both parties consenting hereto) that the times for taking testimony under the order dated June 27, 1913, as modified by the order of August 8, 1913, be further extended so that the petitioner be allowed until September

1, 1913, inclusive, for evidence in chief; the respondents be allowed until November 1, 1913, inclusive, for evidence in defense, and the petitioner be allowed to November 14, 1913, inclusive, for rebuttal.

By the court:

CHARLES K. DARLING, *Clerk.*

The above-named parties hereby consent to the entry of the foregoing order.

CHAS. F. CHOATE, Jr.,
for Defendants.
WM. S. GREGG,
Spl. Asst. to the Attorney General.

1408 *Stipulation.*

[Filed September 20, 1913.]

It is hereby agreed between counsel for the petitioner and for the defendants that petitioner's Exhibit No. 162, to wit, a certified copy of the record in the case of United Shoe Machinery Company vs. Thomas G. Plant Company et al., in the Supreme Judicial Court for Suffolk County, Massachusetts, may be used upon the final hearing and upon appeal in the cause at bar without printing the same as a part of the record.

W. S. GREGG,
of Counsel for Petitioner.
CHAS. F. CHOATE, Jr.,
Counsel for Defendants.

1409 *Petitioner's motion to strike out.*

[Filed December 2, 1913.]

Now comes the petitioner and shows that under the order of reference to a special examiner the defendants were only authorized to introduce testimony before the examiner in defence of the proofs presented by the petitioner before the examiner.

That the petitioner introduced proofs before the examiner relating to patents on—

Welt and turn machines, out-sole stitchers, lasting machines, heel-nailing and attaching machines, channeling machines, rough rounders and channelers, sole laying, leveling, or beating machines, skiving machines, pegging machines.

That the defendant the United Shoe Machinery Company offered patents and evidence in reply to the proofs presented by the petitioner, and further,

That in the proceedings before the examiner said defendant, against the objections of counsel for the petitioner seasonably inter-

posed, offered in evidence, and caused to be marked as exhibits hundreds of additional patents which did not relate to the patents offered in evidence by the petitioner and were not in defence of the petitioner's proofs, and offered and caused to be inserted in the records testimony in reference to said additional patents, none of which testimony was in defence of the proofs presented by the petitioner.

1410 That the machines in reference to which the defendant offered evidence, by way of patents and testimony in reference to such patents and in reference to pending applications, which evidence was not in defence of any of the proofs presented by the petitioner, comprise those noted in the list hereto attached and made a part hereof.

And the petitioner moves that all patents offered in evidence by the defendant relating to the machines noted in the schedule hereto annexed and all testimony in reference thereto and in referece to pending applications for patents and all other evidence offered by the defendant not in defence of the proofs presented by the petitioner before the examiner be stricken from the record.

The testimony, patents, and matters herein objected to are too numerous and extended to be herein specifically pointed out, but, if this honorable court so directs, will be specified hereafter by reference to pages, etc., of the printed record, when copies of the printed record are procured.

ALLEN WEBSTER,
Special Assistant to the Attorney General
in above-named case.

1411 *Petitioner's motion to strike out.*

[Filed December 2, 1913.]

Now comes the petitioner in the above-entitled cause, and shows that the petition was filed December 12, 1911.

That in the proceedings before the special examiner the defendant the United Shoe Machinery Company offered in evidence 157 patents bearing date and issued after the date of the filing of said petition, and caused said patents to be marked as exhibits in this cause, and caused to be inserted in the record testimony with reference to said patents and with reference to the structures shown therein and with reference to various transactions occurring after the date of the filing of the petition herein, all being against the objection of counsel for the petitioner seasonably taken. All of which matters and things tioner before the examiner be stricken from the record.

The petitioner prays that all said patents and all testimony with reference to the same, and with reference to all matters and things

occurring after the filing of the petition herein, be stricken from the record.

The matters herein referred to will be particularly pointed out by reference to page and number, if so directed by this honorable court.

ALLEN WEBSTER,
Special Assistant to the Attorney General
in the above named case.

1413 *List of parts of exhibits to be specifically relied upon by petitioner, etc.*

[Filed December 9, 1913.]

WASHINGTON, D. C., *November 12, 1913.*

To United Shoe Machinery Company and other defendants—In re United States, petitioner, v. United Shoe Machinery Company, of New Jersey, et al., in Equity No. 301—District Court of the United States for the District of Massachusetts.

There is hereby submitted the following information, indicating certain parts of exhibits introduced on the taking of testimony in open court, that will be specifically relied upon by petitioner, and also some of the purposes for which said documentary evidence was introduced, to wit:

1. Exhibit 1, certificate of incorporation of United Shoe Machinery Company, will be relied upon as a whole to show said company's incorporation, date of its organization, and the powers and objects thereof.

2. Exhibit 2, certificate of incorporation of United Shoe Machinery Corporation, will be relied upon as a whole to show said company's incorporation, date of its organization, and the powers and objects thereof.

3. Exhibits 3 to 13, inclusive, and Exhibit 59; forms of leases used by the companies which combined and promoted the organization of United Shoe Machinery Company. Said leases will be relied upon as a whole to show the status of the shoe machinery business before the organization of the United Company; the manner in which the several branches of said business had been conducted when said consolidation into United Shoe Machinery Company was made; and that there was competition between said several companies, and especially between the Eppler and Goodyear companies in respect to welting machines and out-sole stitching, and between the Goodyear Company and the Consolidated & McKay Lasting Machine
1414 Company with respect to lasting machines; and further, that there were unlawful restrictions in some of the leases in use by said companies, especially in Exhibits 3, 4, and 5, leases by the

Goodyear Company which contained clauses prohibiting the use of the elased machinery with other than Goodyear machines, and Exhibits 6, 7, 9, and 10, leases of the Consolidated & McKay Company, which contained clauses requiring the use of the leased machines to the full capacity, and also clauses requiring the lessee to take all additional machines which it might need from the lessor; and of Exhibit No. 13, by the Davey Pegging Machine Company, which contained clauses requiring the exclusive use of said pegging machine for pegging purposes, and requiring all additional machines that might be needed for said purposes to be taken from the lessor.

4. Exhibits 14 to 58, inclusive, 149 and 168 to 174, inclusive, and 176, forms of leases executed by the United Shoe Machinery Company and companies under its control. These leases will be relied upon as a whole to show the general system by which the United Comapny carries on its business, and the object and intent of said system. Furthermore, special clauses contained therein will be specifically relied upon, as follows:

(a) A provision which may be designated as the "full capacity" clause; an example of which, taken from Exhibit No. 21, reads as follows:

"The lessee shall use the leased machinery to its full capacity upon all boots, shoes, or other footwear, or portions thereof, made by or for the lessee in the manufacture or preparation of which such machinery is capable of being used." (Exhibit No. 21, lease for No. 5 lasting machine, B. of E., p. 185.)

This clause, or its equivalent, appears in Exhibits Nos. 14, 15, 16, 17, 18, 19, 20, 21, 22, 24, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 42, 43, 44, 45, 46, 52, 168, 172, 173, 174, and 176.

(b) A provision which may be designated as the "additional machines" clause, an example of which, taken from Exhibit No. 31, is as follows:

"In case the lessee has more work of the kind which can be
1415 performed by any of the machines belonging to the metallic department of the lessor than the capacity of the metallic department machinery which he has under lease from the lessor will permit, then the lessee shall take from the lessor under a like lease and license sufficient additional metallic department machinery to perform the work." (Exhibit No. 31, metallic department lease, B. of E., p. 291.)

This clause, or its equivalent, appears in Exhibits Nos. 27, 29, 30, 31, 32. 33, 34, 35, 36, 39, and 176.

(c) A provision which may be designated as the "exclusive-use" clause, an example of which, taken from Exhibit No. 21, is as follows:

"If at any time the lessee shall fail or cease to use exclusively lasting machinery held by him under lease from the lessor for lasting

all boots, shoes, and other footwear made by or for him, which are lasted by the aid of machinery, or shall fail or cease to use exclusively tacking mechanisms and appliances held by him under lease from the lessor, for doing all work in the manufacture of all boots, shoes, and other footwear made by or for him which is done by the aid of tacking mechanisms and appliances, the lessor, although it may have waived or ignored prior instances of such failure or cessation, may at its option terminate forthwith by notice in writing any or all leases or licenses of lasting machines, lasting machinery, lasting mechanisms, or lasting devices then existing between the lessor and the lessee, whether as a result of assignment to the lessor or otherwise; and the possession of and full right to and control of all lasting machines, lasting machinery, lasting mechanisms, and lasting devices, the lease or license of which is so terminated, shall thereupon revest in the lessor free from all claims and demands whatsoever." (Exhibit No. 21, lease for No. 5 lasting machine, B. of E., pp. 187–8.)

This clause, or its equivalent, appears in Exhibits 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 28, 37, 38, 39, 44, 45, 46, 52, 149, 168, and 171.

(d) A provision which may be designated as the "prohibitive" clause, an example of which, taken from Exhibit No. 21, is as follows:

"The leased machinery shall not nor shall any part thereof be used in the manufacture or preparation of any welted boots, shoes, or other
footwear, or portions thereof, which have been or shall be
1416 welted in whole or in part or the soles in whole or in part stitched by the aid of any welt-sewing or sole-stitching machinery not held by the lessee under lease from the lessor, or in the manufacture or preparation of any turned boots, shoes, or other footwear, or portions thereof, the soles of which have been or shall be in whole or in part attached to their uppers by the aid of any turn sewing machinery not held by the lessee under lease from the lessor or in the manufacture of any boots, shoes, or other footwear which have been or shall be in whole or in part pulled over, slugged, heel-seat nailed, or otherwise partly made by the aid of any pulling over or 'metallic' machinery not held by the lessee under lease from the lessor." (Exhibit No. 21, lease for No. 5 lasting machine, B. of E., page 185.)

This clause, or its equivalent, appears in the following lease forms: Exhibits Nos. 15, 16, 18, 19, 20, 21, 23, 24, 25, 26, 27, 28, 30, 34, 35, 36, 37, 38, 39, 40, 41, 43, 45, 51, 52, 56, 149, 168, 169, 170, 171, and 172.

(e) A provision which may be designated as the "forfeiture of every lease" clause an example of which, taken from Exhibit 21, is as follows:

"But if any breach or default shall be made in the observance of any one or more of the conditions in this agreement contained or

contained in any other lease or license agreement subsisting between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise and expressed to be obligatory upon the lessee, the lessor shall have the right by notice in writing to the lessee to terminate forthwith any or all leases of or licenses to use machinery then in force between the lessor and the lessee, whether as the result of assignment to the lessor or otherwise, and this notwithstanding that previous breaches or defaults may have been unnoticed, waived, or condoned by or on behalf of the lessor. . . . Upon the expiration or termination of this agreement or any extension thereof or of the lease and license herein contained by notice or by reason of any default on the part of the lessee as to the terms of this agreement or of any other lease or license agreement from the lessor or otherwise, in any manner whatsoever, the lessee shall forthwith deliver the leased machinery to the lessor at Beverly, Massachusetts, complete and in good order, reasonable wear and tear alone excepted." (Exhibit No. 21, lease for No. 5 lasting machine, B. of E., page 185.)

This clause, or its equivalent, appears in every lease form of
1417 United Shoe Machinery Company and its subsidiary companies and introduced as exhibits.

(f) Petitioner will also rely on the clause which requires the lessee to purchase all repair parts from the lessor, and which appears in all of said lease forms, and also upon the clauses which specify the amount of royalty charged and the amount of initial payment, where such is required, and the amount of return charge, where such charge is required, for the purpose of showing the additional burdens assumed by the lessees under those leases which do not contain the "prohibitive clause."

5. Exhibits 59 to 131, inclusive, and 143 to 145, inclusive, some of which are contracts for the purchase of stocks and properties of other concerns engaged in different branches of the shoe machinery business, and some of which are contracts of employment by United Shoe Machinery Company.

Petitioner will rely upon said exhibits.

(a) Each as a whole, and also collectively, to show the general policy of defendants to acquire the business of shoe-machinery concerns and to eliminate all competitors and all possible competitors from such business, and to monopolize the shoe-machinery industry.

(b) It will rely particularly upon certain clauses which require the vendors to assign all rights and interests in and to all inventions and improvements in the machinery mentioned which might for an indefinite or for a definite period after the execution of the contract be possessed by the vendors, and which bind the vendors not to engage in certain lines of business for an indefinite or definite length of time and not to engage in any business in competition with the

United Shoe Machinery Company or the subsidiaries of said company. Clauses of this kind appear in Exhibits Nos. 60, 67, 68, 70, 74, 78, 81, 82, 83, 84, 85, 87, 91, 92, 93 94, 95, 98, 99, 100, 101, 104, 105, 106, 108, 109, 111, 112, 113, 114, 115, 120, 121, 122, 123, 124, 125, 127, 128, 129, 130, 143, 144.

(c) It will also rely upon certain clauses in the contracts of employment which bind the party employed to convey to the employer all improvements or inventions relating to the machinery
1418 described which the employee might acquire within an indefinite period or a period specifically fixed, and which binds the employee not to enter business in competition with United Shoe Machinery Company or with any of its subsidiaries. Clauses of the kind mentioned appear in Exhibits Nos. 64, 65, 69, 72, 73, 107, and 126.

6. Exhibits 133 to 142, inclusive, contracts between Thomas G. Plant and United Shoe Machinery Company. All parts of these exhibits will be relied upon to show the kind of properties acquired by said purchases and extent and value of same, and that said Plant and the United Company were at the time said purchase was made in active competition, and consequently the object of the United Company in acquiring said properties.

The record in the case of United Shoe Machinery v. Thomas G. Plant, which was introduced, but by agreement not printed, will be relied upon for the same purpose, and also to show the conduct of the United Company towards Plant prior to said purchase and the inducements which caused Plant to sell his property to the United Company.

7. Exhibit 146, an address to the lessees of the United Shoe Machinery Company, dated June 10, 1910, will be relied upon as a whole to show the policy and growth of the United Shoe Machinery Company, and the first paragraph on page 1071 of the printed record will be specially relied upon to show one of the methods of inducing manufacturers to patronize the United Shoe Machinery Company instead of its competitors.

8. Exhibit 147, statement of Charles H. Jones, published May 24, 1906, was introduced to show what was actually said by Mr. Jones and to make clear his explanation of parts thereof.

9. Exhibit 149, lease of Goodyear machines to Selz-Schwab & Company, dated April 4, 1905, will be relied upon as a whole to show terms of lease, and paragraphs 1, 7, and 8 will be especially relied upon to show that Selz-Schwab & Company was prohibited from using Haverhill machines, as testified to by Mr. Selz, and also such other machines as indicated in said clauses.

1419. 10. Exhibits Nos. 151, 152, 153, and 175, which are addresses of officers and directors to stockholders:

(1) Of McKay Shoe Machinery Company, dated February 15, 1899;

(2) Goodyear Shoe Machinery Company, dated February 8, 1899;

(3) International Goodyear Shoe Machinery Company, dated February 18, 1899; and

(4) Consolidated & McKay Lasting Machine Company, dated February 11, 1899.

All parts of said addresses will be relied upon to show method of organization of the United Company, the amounts paid the constituent companies, and the inducements that led up to and the purposes of its formation.

11. Exhibit No. 154, proposition submitted to Mr. Winslow by Jackson Johnson, representing certain shoe manufacturers, will be relied on to show efforts made by manufacturers to secure modification of leases and terms desired by them, and the continued and persistent denial of any relief by the United Company and its officers.

12. Exhibits Nos. 155 and 156, correspondence between F. C. Rand and Mr. Winslow, will be relied upon for the purpose stated under No. 11.

13. Exhibit No. 157, agreement between Drew, Selby & Company and United Company, dated March 13, 1900, will be relied upon to show that the United Company obtained control of the machines mentioned therein, in the manner mentioned, and also the company's method of restraining the use of independent machines.

14. Exhibits Nos. 180, 181, 182, 183, 184, 185, and 186, statements of financial condition of the United Shoe Machinery Company on March 1st of 1901, 1902, 1903, 1904, 1905, 1906, and 1907, and Exhibits 164, 165, 166, and 167, copies of reports of the United Shoe Machinery Corporation to the annual meetings of the stock-
1420 holders of said company for the years 1908, 1909, 1910 and 1911, will be relied upon to show the growth of the company's resources and power.

15. Exhibit No. 187, statement showing amount of capital stock and amount thereof owned by United Shoe Machinery Company, and nature of business of each corporation in which the United Shoe Machinery Company has a financial interest, and Exhibit No. 188, list showing officers and directors of such companies, will be relied upon as a whole to show relation between United Company and its subsidiaries, and that they are engaged in a naturally competitive business with that of the United Company, and also to show the

extent of control by the United Company over said subsidiaries and the entire shoe-machinery business.

16. Exhibit 189, agreement dated September 11, 1899, between United Shoe Machinery Company and Henry W. Peabody and others, doing business under the name of Henry W. Peabody & Company. The first paragraph of the preamble of this agreement is particularly relied upon to show that the United Company had already secured control of certain lines of the shoe-machinery business and was intending to secure control of other parts thereof.

The foregoing information is given in compliance with the suggestion of the presiding judge, made during the introduction of the Government's testimony in open court, and the defendant may be informed as to the principal reasons for introducing the said documents, and of many of the particular parts thereof, which will be relied upon; but some exhibits and some parts of other exhibits may by oversight or for other reasons be omitted herefrom, and petitioner expressly reserves the right to rely upon any and all exhibits, and any and all parts of exhibits, for any purpose which it may deem material to any question involved in the case, regardless of whether the parts and purposes are herein expressly stated or not.

J. A. FOWLER,
W. S. GREGG,
Special Assistants to the Attorney General.

1421 *Stipulation as to objections to testimony and further examination before special examiner.*

[Filed Jan. 19, 1914.]

With reference to the motions of the United States relating to the admission of testimony before the special examiner, which motions are shown by and printed in the record on pages 2841 and 2846, the United States withdraws its motions and waives its objections founded on the claim that the evidence was improperly taken before the special examiner, reserving all other objections for irrelevancy and incompetency heretofore or hereafter made with the understanding, to which the court assents and agrees, that the United States may make further cross-examination or introduce evidence in rebuttal with reference to the matters to which the objections and motions relate, the further examination and cross-examination to proceed before the special examiner or proceed at the resumption of the hearings on the third of February in open court, as the parties may hereafter agree or the court may order.

C. F. C., JR.
M. S. G.

1422 *Request for leave to amend petition.*

[Filed January 14, 1914.]

Petitioner in the above-entitled cause asks leave to amend its petition, upon its face, as follows:

I.

(1) That the first and second sentences in Section IV be amended so as to read as follows:

Defendants Sidney W. Winslow, William Barbour, Elmer P. Howe, John H. Hanan, George E. Keith, Edward P. Hurd, George W. Brown, Wallace F. Robinson, Rudolph Matz, and others, owners, officers, directors, and agents of said Goodyear Shoe Machinery Company, International Shoe Machinery Company, Goodyear Shoe Machinery Company of Canada, Consolidated & McKay Lasting Machine Company, McKay Shoe Machinery Company, Eppler Welt Machine Company, International Eppler Welt Machine Company, and Davey Pegging Machine Company, not being satisfied with the benefit of the lawful monopolies and rights belonging to them under letters patent of the United States and of other countries, which they had enjoyed for many years, pertaining to shoe machinery, and parts thereof, and designing and intending unduly, unreasonably, and unlawfully to extend, expand, and perpetuate said monopolies and rights, and to enhance the value thereof at the expense of the boot and shoe manufacturers and of the public generally, and to use the same as a means for unlawfully controlling interstate and foreign trade and commerce in shoe machinery to a greater extent than was warranted by said letters patent, determined to acquire a complete monopoly of the manufacture, sale, and lease of all shoe machinery used in adjusting and attaching the upper to the last, in preparing the bottom and heel and fastening them to the upper, and in finishing the bottom and heel of the shoe after said operations had been performed; and to destroy existing competition among the manufacturers and dealers in such machinery, and through unlawful combinations and agreements to exclude all others from said trade
1423 and commerce. For the accomplishment of this purpose they conceived the idea of acquiring the ownership or control of all concerns engaged in manufacturing and dealing in any and all kinds of shoe machinery of the kinds above described, and then to refuse to sell or lease any of the essential machines to the manufacturer of shoes except on condition that he buy or lease of them practically all other machinery of whatever kind necessary or useful to such manufacturer of shoes, and thereby to exclude all competition by other manufacturers of such shoe machinery and to monopolize

the trade and commerce therein among the States and with foreign countries.

(2) That the first paragraph of Section VIII down to and including the phrase "and foreign countries" be amended so as to read as follows:

In addition to the foregoing, defendants, through United Shoe Machinery Company of New Jersey, by the purchase of all or a controlling interest in the business of a number of individuals and corporations engaged in the shoe machinery business in foreign countries, by the organization of other corporations and the ownership of their capital stock, and by contracts, agreements, and combinations with such corporations, have restrained and monopolized, and now restrain and monopolize, trade and commerce, between this and foreign countries, of all the principal and auxiliary machines used for adjusting and attaching the upper to the last, preparatory to attaching the bottom to the upper, machines for preparing the bottom and heel and attaching them to the upper, and machines for finishing the bottom and heel, and clicking and eyeletting machines.

(3) That Section XI be amended so as to read as follows:

By virtue of the unlawful contracts and combinations above described, defendants control all the large and important establishments in the United States which were formerly engaged in the manufacture, sale, and lease of machines designed and used for adjusting and attaching the bottoms to the uppers of boots and shoes, and kindred and auxiliary machines; they have obligated scores of successful shoe machinery men to refrain from trade and
1424 commerce therein and have acquired a monopoly of interstate and foreign trade and commerce in machines used for adjusting and attaching the upper to the last preparatory to attaching the bottom to the upper, machines for preparing the bottom and heel and attaching them to the upper, and machines for finishing the bottom and heel, and clicking and eyeletting machines.

II.

That the second paragraph of Section XII, entitled "Conclusion," be amended so as to read as follows:

(1st) The lease and license agreements heretofore described when taken as a system, and the several restricted provisions therein when taken singly or in connection with the other provisions of the same lease, or with the same and other provisions of other lease and license agreements held by the same lessee, have been ever since their adoption, and still continue to be, unlawful in this:

(a) It was and is unlawful for defendants, or either of them, to exact from or to execute to any of its lessees an instrument of lease

or license containing any or all of the following covenants or agreements, or any agreement or covenant of a similar character, to wit, (i) a covenant or agreement that the lessee should use the leased machinery to its full capacity; (ii) an agreement that in case the lessee should have more work of the same kind as that performed by the leased machine than the capacity of such machine would permit, the lessee should take from the lessor sufficient additional machinery to perform such work regardless of whether such agreement was in the form of a covenant or of a condition authorizing the forfeiture of the leased machinery in case it should be violated; (iii) an agreement or stipulation that if the lessee should fail or cease to use exclusively designated machinery for performing the kind of work described in the lease, the lessor might at its option terminate that lease and all other leases held by the lessee from the lessor for machinery of the class or classes described; (iv) a covenant or agreement prohibiting the use of the leased machinery upon shoes or
1425 other footwear than such as had been or should be operated upon by certain designated machinery belonging to the lessor; (v) a covenant or agreement that if any breach or default should be made in the observance of any one or more of the conditions in that or any other lease or license agreement existing between the lessor and lessee, the lessor should have the right to terminate any and all leases of or licenses to use machinery then in force between the lessor and lessee; (vi) a covenant or agreement admitting the validity of the patents owned by the lessor, and under which lessee was licensed, any of the inventions of which might be embodied in the leased machinery, and also, in the Goodyear leases, admitting the validity of the title of the lessor to, and its right to the exclusive use of, the trade names of "Goodyear Welt" and "Goodyear Turn," and stipulating that the lessee should not infringe or contest at any time, either before or after their expiration, the letters patent specified in a schedule attached to the lease, or (in said Goodyear leases) the lessor's right to the use of said trade names; (vii) an agreement upon the part of the lessee extending the lease for a period of seventeen years.

(b) Said covenants and agreements have been and are especially unlawful when taken in connection with other covenants and agreements in the same lease, and with the same and other covenants and agreements in other leases held by the same lessee from the United Shoe Machinery Company, of New Jersey, or from the companies controlled by it.

(c) Each and all of the leases executed by defendants are especially unlawful when considered with reference to the existing conditions of the production of and commerce in the shoe machinery

described in this petition as amended, to wit, the fact that said defendants possess a practical monopoly of said production and commerce.

(d) The so-called alternative system of leases whereby for a certain initial payment or increased price of material the lessee might obtain a lease from which one or more of the restrictive clauses enumerated might be omitted is not free of illegality, because the state of production of and interstate and foreign commerce in shoe machinery is such that the omission of such clause
1426 or clauses has been and is of no practical benefit to the lessee, and because the amount of said initial payment, or increased price of material, is such as to induce and constrain the lessee to take the restricted leases in preference to the so-called unrestricted lease, and, further, because said so-called unrestricted leases are in and of themselves unlawful on account of the restrictive provisions, above described, contained therein.

(e) The system of leases as devised by said defendants and used by them is unlawful because it was and is designed to place the shoe machinery business, including the interstate and foreign commerce therein, under the domination and control of defendants, which object has been fully accomplished thereby.

(f) All of the covenants, conditions, and agreements, and the lease and license agreements wherein said covenants, conditions, and agreements are contained, are unlawful regardless of the claim of defendants that they have valid patents on the leased machinery or on parts thereof or on devices attached thereto, because (i) in many instances the machine was not, when the lease and license therefor was executed, protected by valid, basic patents; (ii) in other instances the patent on the leased machinery or appliances attached thereto expired, or will expire, after the execution, but before the termination, of the lease; (iii) the existence of a valid patent upon an entire machine, or any part thereof or attachment thereto, does not authorize in and of itself the execution of a lease for such machine containing any one or more of the restrictive clauses above described; and (iv) the covenants, conditions, and stipulations appearing in the various lease and license agreements heretofore described were and are required in pursuance of the general intent and purpose of defendant to restrain interstate and foreign trade and commerce in shoe machinery and monopolize the same, have been and are one of the most effective parts of the scheme initiated by the contracts and conspiracies to organize the defendant United Shoe Machinery Company, of New Jersey, and continued to the present time by the acquisition of the properties of competing companies and by the other acts heretofore described.

1427 III.

That Section XII of the petition be amended, by inserting a sixth reason why defendants' system of leasing machinery is unlawful, as follows:

(6th) The system of defendants in putting out their machinery by leases containing the covenants and agreements heretofore described is unlawful because it prevents full and free competition among shoe manufacturers in the production and sale in interstate commerce of shoes and other footwear.

J. A. FOWLER,
W. S. GREGG,
Special Assistants to the Attorney General.

Objections of defendants to motion of the United States to amend its bill, made January 14, 1914.

[Filed February 3, 1914.]

And now comes the defendants severally, and severally object to said motion of the United States to amend its bill, and severally set forth upon the record their objections thereto, as follows:

1. Because the defendants would be prejudiced by the allowance of the amendment.

2. Because the proposed change is one of substance and not one merely of form.

3. Because to allow the proposed amendment would be inequitable and unfair to and would greatly prejudice the defendants in that the issue which has been tried and as to which the defendants have cross-examined the witnesses of the United States and introduced their own testimony is materially different from the issue presented by the proposed amendment.

4. Because the cause has not been heard upon any assumption that the issues presented by the proposed amendment were the real issues in dispute.

1428 5. Because the proposed amendment would not conform the pleadings to the proof.

6. Because to allow the proposed amendment would be inequitable in that the defendants would suffer more hardship from the allowance of the amendment than the United States would suffer from its denial.

7. Because to allow the proposed amendment would be inequitable and unfair to the defendants in that it would be a real impossibility to separate from the record as it now stands the evidence relevant

to the issue as presented by the amendment from the evidence irrelevant to such issues.

8. Because the United States has not sustained the burden which rests upon it of showing that special circumstances exist to warrant the allowance of a material amendment of the bill at the present stage in the proceedings.

9. Because all the facts having any bearing upon the amendment were known to the United States at the date when the original bill was brought and the proposed amendment could, therefore, have been made a part of the original bill, or they were in any event known to the United States when it had presented its testimony and rested, and, therefore, it is now too late for the United States to present this amendment.

10. Because the proposed amendment is too vague, indefinite, and uncertain.

11. Because if any amendment is proper at this stage of the proceedings it should be clear and specific and should conform to the evidence, which is not true of the proposed amendment.

12. Because no evidence has been introduced pertaining to certain charges made in the proposed amendment.

13. Because if any decree were entered against the defendants upon the bill as amended, it would deprive the defendants of their right to have a decree or finding entered against them only after full hearing and the right to cross-examine all witnesses upon the charges made against them.

14. Because the defendants at this stage of the proceedings are entitled to a decree on the charges and issues presented by the
1429 original bill without such material change therein as would be effected if the proposed amendments were allowed.

15. Because any decree against the defendants which might follow an allowance of the proposed amendment would deprive the defendants of their property and rights without due process of law inasmuch as the defendants have had no opportunity to defend against the issues presented by the proposed amendment and no opportunity to cross-examine the witnesses presented by the Government as to the issues presented by such amendment.

16. Because the proposed amendment abandons the case alleged in their bill by the United States and makes a new and different case by way of amenement.

17. Because the original bill charges an intent to monopolize shoe machinery generally, and an actual monopoly in shoe machinery generally, while the bill, if amended, charges an intent to monopolize and an actual monopoly in only specific kinds of shoe machinery.

18. Because the intent charged in the original bill, with which all the acts charged therein were alleged to be done, was an intent to

monopolize shoe machinery generally, while the intent charged in the bill, if amended, is an intent to monopolize only specific kinds of shoe machinery.

19. Because the proposed amendment comes too late.

20. Because the attention of the United States was called to the necessity of either proving their allegations or amending, as early as May 20, 1913, before the taking of testimony herein, and the United States neglected and refused either to prove their allegations or to amend the same until January 13, 1914, after the close of defendants' testimony in the case, and then attempted to amend the same without any proof of the original allegations.

21. Because if the amendment be allowed at this stage, after the practical close of the case, it will require the reopening of the case, new pleadings, and new evidence.

22. Because if the propesed amendments are allowed, the bill as amended becomes inconsistent and repugnant in that the allegation in regard to the leases, at page 21 of the bill, alleging an
1430 intent to acquire complete ~~control~~ of shoe machinery, is inconsistent with the proposed amendment at page 17, alleging an intent to monopolize only specific kinds of shoe machinery.

23. Because if the proposed amendments are allowed, the bill becomes inconsistent and repugnant in that the allegation at page 27 in regard to acquisitions (described from pages 27 to 73 of this bill), and that they were acquired in pursuance of their purpose to monopolize the shoe machinery industry, is inconsistent with and repugnant to the allegation at page 17, as amended, in regard to an intent to monopolize only specific kinds of shoe machinery.

24. If the amendment on page 17, immediately heretofore described, is made, the allegation on page 69 of the bill, that defendants to monopolize trade and commerce in shoe machinery entered into agreements with Plant, becomes inconsistent with and repugnant to said amendment.

25. If the amendment on page 17 heretofore referred to is made, the allegation on page 26 as to the resulting concentration in defendants' hands of the almost entire shoe machinery business becomes inconsistent with and repugnant to said amendment.

26. If the amendment on page 17 heretofore referred to is made, the allegation in regard to the organization of the United Shoe Machinery Corporation, on page 75, relating to trade and commerce in shoe machinery generally, becomes inconsistent with and repugnant to said amendment.

27. Because the second section of the proposed amendment, relating to leases, sets up many new charges of invalidity as to lease provisions not heretofore set forth by the bill.

28. Because the second section of said proposed amendment complains of the invalidity of an alleged system of leases, whereas there is no evidence in the case as to the existence of any such system, and the same is not complained of in the bill.

29. Because the second section of said proposed amendment complains of the invalidity of an alleged system of leases, whereas the existence of any such system of leases has been heretofore expressly disclaimed by the counsel for the United States.

30. Because in the second section of said proposed amend-
1431 ment, under the heading "(1st) (a) (ii)," the clause therein referred to, which may be called the additional machinery clause, is new and not heretofore contained or set forth in the pleadings of the United States.

31. Because in the second section of said proposed amendment, under the heading "(1st) (a) (iv)," the clause therein referred to, which may be called the prohibitory use clause, is new and not heretofore contained or set forth in the pleadings of the United States.

32. Because in the second section of said proposed amendment, under the heading "(1st) (a) (v)," the clause therein referred to, which may be called the right-to-terminate clause, is new and not heretofore contained or set forth in the pleadings of the United States.

33. Because in the second section of said proposed amendment, under the heading "(1st) (a) (vi)," the covenant and agreement therein contained, in regard to the admission of the validity of patents, is new and not heretofore contained or set forth in the pleadings of the United States.

34. Because in the second section of said proposed amendment, subdivision "(b)," setting up that other covenants and agreements are especially unlawful, is new and not heretofore contained or set forth in the pleadings of the United States.

35. Because in the second section of said proposed amendment, subdivision "(c)," setting up that each lease is especially unlawful when considered in reference to existing conditions, is new and not heretofore contained or set forth in the pleadings of the United States, and differs materially and in substance from any charge therein contained.

36. Because in the second section of said proposed amendment, subdivision "(d)," relating to a so-called alternating system of leases, is new and not heretofore contained or set forth in the pleadings of the United States, and differs materially and in substance from any charge therein contained.

37. Because in the second section of said proposed amendment, subdivision "(e)," relating to the system of leases being unlawful,

is new and not heretofore contained or set forth in the plead-
1432 ings of the United States, and differs materially and in substance from any charge therein contained.

38. Because in the second section of said proposed amendment, subdivision "(f)," is objected to because it expands paragraph B at page 81 of the bill, so as to make the charge therein contained differ materially and in substance from the charge now contained therein.

39. Because the third section of complainant's proposed amendment, in relation to the system of defendants in putting out leases preventing competition in the manufacture of shoes, is absolutely new and novel and not set forth or referred to in any way in the pleadings of the United States.

40. Because upon the whole case this court should, in the exercise of its discretion, refuse to allow the amendment prayed.

By their attorneys:

FREDERICK P. FISH,
CHARLES F. CHOATE, Jr.,
WILLIAM A. SARGENT,
MALCOLM DONALD,
HAROLD G. DONHAM,
WALTER B. FARR,
LAFAYETTE R. CHAMBERLIN.

Order of court, February 4, 1914.

PUTNAM, DODGE, and BROWN, JJ.: As the request of the United States filed January 14, 1914, for leave to make sundry amendments to the petition with reference to Sections IV, VIII, and XI, with substitutions, is not urged as though the United States deemed the same necessary, and as it is objected to by the defendants, we do not feel justified at this late stage in allowing it, and the same is disallowed. This, however, is with the express statement on the part of the court that it reserves all questions with reference to the construction of the pleadings as urged by the defendants, whether as original or as modified by the progress of the case, is so modified.

1433 The request of the United States to be allowed to amend Section XII is denied.

It is ordered that the amendments offered by the United States and this ruling with reference thereto be made a part of the record of the proceedings.

By the court:

CHARLES K. DARLING, *Clerk.*

Order, February 10, 1914.

PUTNAM, DODGE, and BROWN, JJ.: With the consent of the parties, it is ordered that the United States shall have from February 24 to March 10, 1914, inclusive, for further cross-examination of Nelson W. Howard, and the introduction of evidence in rebuttal before the special examiner, Charles K. Darling, with reference to the matters provided for in the order entered in this cause on January 14, 1914; and also to introduce evidence before the special examiner in rebuttal to evidence submitted by the defendants in open court with respect to patents and machines obtained by the defendants from Thomas G. Plant.

And the defendants shall have from March 11 to March 24, 1914, inclusive, to introduce evidence in surrebuttal with respect to the evidence of the United States relating to matters provided for in the order of January 14, 1914, and evidence introduced by the United States before the special examiner with respect to patents and machines obtained by the defendants from Thomas G. Plant.

The court reserves control of the proceedings before the special examiner.

By the court:

CHARLES K. DARLING, *Clerk*,
By JOHN E. GILMAN, Jr., *Deputy Clerk*.

1434 District Court of the United States, District of Massachusetts.

UNITED STATES OF AMERICA, PETITIONERS, v. UNITED SHOE MACHINERY COMPANY, OF NEW JERSEY, and others, respondents.	In Equity. No. 301.

Before Putnam and Dodge, Circuit Judges, and Brown, District Judge.

[March 18, 1915.]

PUTNAM, J.: Of course, a proceeding on the criminal side of the court can not operate as an estoppel in a civil proceeding; but it may be referred to safely in an introductory way, and in explanation of questions of law to be relied on.

The general features of this case are largely stated in United States v. Winslow, 227 U. S., 202, and 195 Fed. Rep., 578; but there are differences, so that we will quote extensively from the bill in the present suit.

In so much of the bill as relates to the organization, we have no occasion to make any distinction between the United Shoe Machinery

Company and the United Shoe Machinery Corporation, two New Jersey organizations who are made respondents; and we do not know that we will have occasion to refer to the subordinate organizations made respondents and known as the United Shoe Machinery Company, of Maine, etc.

1435 The bill alleges the organization of the United Shoe Machinery Company, of New Jersey, as follows:

"Defendants Sidney W. Winslow, William Barbour, Elmer P. Howe, John H. Hanan, George E. Keith, Edward P. Hurd, George W. Brown, Wallace F. Robinson, Rudolph Matz, and others, owners, officers, directors, and agents of said Goodyear Shoe Machinery Company, International Goodyear Shoe Machinery Company, Goodyear Shoe Machinery Company of Canada, Consolidated and McKay Lasting Machine Company, McKay Shoe Machinery Company, Eppler Welt Machine Company, International Eppler Welt Machine Company, and Davey Pegging Machine Company, not being satisfied with the benefit of the lawful monopolies and rights belonging to them under letters patent of the United States and of other countries which they had enjoyed for many years, pertaining to shoe machinery, and parts thereof, and designing and intending unduly, unreasonably, and unlawfully to extend, expand, and perpetuate said monopolies and rights and to enhance the value thereof at the expense of the boot and shoe manufacturers and of the public generally, and to use the same as a means for unlawfully controlling interstate and foreign trade and commerce in shoe machinery to a greater extent than was warranted by said letters patent, determined to acquire a complete monopoly of the manufacture, sale, and lease of shoe machinery, destroy existing competition among the manufacturers and dealers in such machinery, and through unlawful combinations and agreements to exclude all others from said trade and commerce. For the accomplishment of this purpose they conceived the idea of acquiring the ownership or control of all concerns engaged in manufacturing and dealing in any and all kinds of shoe machinery, and then to refuse to sell or lease any of the essential machines to the manufacturer of shoes except on condition that he buy or lease of them practically all other machinery of whatever kind necessary or useful to such manufacturer of shoes, and thereby to exclude all competition by other manufacturers of such shoe machinery and to monopolize the trade and commerce therein among the States and foreign countries. The various contracts, combinations, conspiracies, and acts, hereinafter described, were steps in carrying out the above mentioned unlawful project. A preliminary agreement was made, and in February, 1899, they incorporated United Shoe Ma-

1436 chinery Company, under the laws of New Jersey, with an

authorized capital of $25,000,000 ($12,500,000 preferred, $12,500,000 common), with broad powers under its charter to manufacture, buy, sell, lease, operate, and deal in and with all kinds of machinery, tools, and implements, and especially in everything in any way connected with or used in the manufacture of boots and shoes. For the stock allotted to each, and for cash, at values far in excess of real worth, four of the old concerns, to wit, Goodyear Shoe Machinery Company, International Goodyear Shoe Machinery Company, Consolidated & McKay Lasting Machine Company, and McKay Shoe Machinery Company, conveyed to the new corporation, as going concerns, their business of manufacturing, selling, leasing, and dealing in shoe machinery, including their letters patent of the United States and of other countries, and all property and rights used in connection therewith, wherever situated; and their principal owners, managers, directors, and officers became managers, directors, and officers in the new company. Stock of the new company was allotted and received as follows."

At this point the bill shows the distribution of the shares of capital stock of the new corporation among the prior corporations combined in it, or their shareholders. It alleges that the prior corporations conveyed to the new corporation their business, patents, and property rights "for the stock allotted to each and for cash, at values far in excess of real worth." No proof was offered in support of this final allegation, and it has not been insisted upon by the United States.

The bill proceeds: "Prior to the organization of United Shoe Machinery Company, of New Jersey, boot and shoe manufacturers, purchasing or leasing machines from one of the aforesaid companies, were not compelled to use exclusively machines mentioned in the aforesaid groups manufactured by either of the other companies. For example, the shoe manufacturer who held lasting machines under lease from the Consolidated & McKay Lasting Machine Company was not required to use, in connection with that company's lasting machines, welt-sewing machines or outsole-stitching machines of the Goodyear Shoe Machinery Company, or those of any other company, and he was free to obtain such machines wherever he could procure them to the best advantage.
1437 The same was true of the trade in welt-sewing machines and outsole-stitching machines, heeling machines, and metallic fastening machines. Defendants, however, not being satisfied or contented with said portion of the trade and commerce in shoe machinery which they acquired through the organization of United Shoe Machinery Company, of New Jersey, and with the intent to acquire complete control of the business of manufacturing and selling or leasing of shoe machinery among the States and with foreign

countries; to exclude all others therefrom, to enhance the cost of said machines to users thereof, and to wrong and to oppress the public, discontinued the sale to boot and shoe manufacturers of each and all of the machines included in said groups of machines, and unlawfully devised, adopted, and put into effect arbitrary, oppressive, and unreasonable lease and license agreements, which boot and shoe manufacturers have been and are required to agree and conform to in order to obtain from said defendants any of the machines included in said groups."

On the whole, as the case developed, no objection was persisted in by the United States to the fact that the policy of the Shoe Machinery Company was to lease its machines instead of selling them. It was plain that this policy was not injurious in a large sense. It enabled manufacturers of small and moderate means to embark in manufacturing to an extent which would have been impossible for them if they had been obliged to purchase machinery, because many machines are so expensive as to lock up capital and render it dead for practical purposes of financing shoe manufacturing. It is also apparent that a portion of the conditions and provisions of leases were in use without complaint before the United Shoe Company was organized; but it is not necessary that we should detail these facts, because we must take the result of the development as to this topic, at least, as it was found at the time the bill was filed in 1911; and, while the prior condition might mitigate any complaint on that point, it cannot answer it.

The bill further proceeds as follows:

"These agreements contain provisions, not found in their former lease and license agreements, which compel boot and shoe manufacturers leasing any of such machines from defendants to agree
1438 to use exclusively one or more of the classes of machines included in said groups of machines owned and controlled by them upon penalty of having all the machines included in said groups so leased to them by defendants immediately reclaimed and taken away and the lease and license agreements canceled. These contracts further require boot and shoe manufacturers to take each of said machines for a period of not less than seventeeen years, regardless of the terms of the patents relating thereto. Lessees thereunder are compelled to obtain all duplicate parts, extras, mechanisms, and devices of every kind needed or used in operating, repairing, or renewing the leased machinery from defendants, at exorbitant prices fixed by them from time to time. Many of these agreements further provide that the lessee shall, at the expiration of seventeen years, and after he has paid large royalties throughout that period, if he shall then have no further use for the machines, return the same to defendants

at their factory at Beverly, Mass., and shall pay to them a return charge, which in some cases amounts approximately to the original cost of building the machines. Defendants have continually, persistently, and arbitrarily enforced the provisions of said lease and license agreements by all the means in their power as against the boot and shoe manufacturers, and have made it their general policy and practice to refuse to furnish such machines to any and all boot and shoe manufacturers who fail to comply with the terms or spirit of the provisions of said lease and license agreements and to otherwise injure them.

"Defendants, in pursuance of their general purpose, inserted in, and made a part of, each lease and license agreement, provisions reserving to themselves the right to forthwith terminate and cancel all existing lease and license agreements between them and the boot and shoe manufacturers if the latter should fail or cease to use exclusively and to their full capacity machines leased or controlled by defendants, thereby prohibiting said manufacturers not only from using competing shoe machinery manufactured in the United States, but also from using any such machinery manufactured in foreign countries and imported here for sale or lease."

There is no proof that the United Shoe Company has enforced its leases in any arbitrary or unreasonable manner. On the whole, it seems to have been moderate with reference to such enforce-
1439 ments, and the number of cases in which anything in the way of a forfeiture has been demanded has been so small that, on looking over the great mass of the operations of the United Shoe Company, such enforcements have been so few as to be practically negligible; and there is no evidence that the duplicate parts, extras, and other incidentals furnished by the United Shoe Company have been sold at exorbitant prices fixed by it, or that the cost involved in the return of machinery has, in any way, approximated its original cost, unless, possibly, in some exceptional instances which have not caught the eye of the court. We do not think the case as developed has turned on these particular allegations.

It might have been expected in a proceeding of this importance, involving so many aspects, that the parties would not, at all times, have been in accord as to the pleadings of the United States. Referring to the allegation that the respondents "conceived the idea of acquiring the ownership or control of all concerns engaged in manufacturing and dealing in any and all kinds of shoe machinery," the utmost that the case can in any event be said to show is a purpose to acquire control of certain machinery connected with bottoming shoes, or later of certain clicking or eyeletting machines; and of this the United States became during the trial so far satisfied that it asked permission to amend the above allegation accordingly. On

the rules of equity pleading, however, which also are applied to some extent to pleadings at common law, an allegation of the whole field covers any part of it, and may be accepted as such without involving any variance.

Allegations such as the following, which run through these pleadings, color them all, and are to be accepted as controlling the entire bill, namely, "not being satisfied with the benefit of the lawful monopolies and rights belonging to them under letters patent of the United States"; "and intending unduly, unreasonably, and unlawfully to extend, expand, and perpetuate said monopolies and rights." The bill in the same line claims that the alleged confederates had, from the outset of the confederation, taken certain action described in the bill for the purpose of perpetuating the rights they had
1440 under existing patents after those patents should expire.

We are dealing now with allegations which seem to assert that the machines acquired by the corporation on its organization were covered by patents, and that its then purpose was to maintain this position, even after the then existing patents expired. This supports the proposition of the respondents that the machinery offered by the respondents was at all times protected by patents succeeding each other. At any rate, it must be accepted that from the beginning the machinery offered by the respondent corporation was, in all its essential elements, protected by patents, and that there has been no proof to the contrary. So that, for the purposes of this case, the machinery has been mainly, if not entirely, of that character.

To prevent possible misunderstanding of the position of the respondents in reference to the fact that the Shoe Machinery Company's machines are protected by patents, we repeat and accept what the respondents say, as follows:

"The extent and character of the rule of property established by the patent laws of the United States, under which this entire shoe machinery work from the very beginning has been carried on, is perfectly clear and definite. The industry has grown up under and has been based upon and made possible by the rights established by those patent laws."

The propositions thus quoted from the respondents are substantially supported by the record. It also may well be gathered from United States v. Winslow, 227 U. S., 202, that the United States, which were then free to put their case as they saw fit, thus put it with reference to the date of the organization of the Shoe Machinery Company, and thus gave it color which we are free to accept as abiding with the organization so long as effectual proof of change to the contrary was not furnished, as it was not. Under the circumstances of the case, this special observation is justifiable; notwithstanding, United States v. Winslow was a criminal proceeding,

because, no doubt, the natural presumption is that the United States made their case as they had reason to believe it to be. Indeed, it affirmatively and emphatically appears at various places in the bill, and it runs all through it, that all the essential interests
1441 which entered in 1899 into the combination forming the United Shoe Machinery Company were, at the time of the formation of that corporation, covered and protected by patents; and there has been no evidence that at any time in the history of the corporation there was any change from its original purposes.

It was at one time largely understood that the Supreme Court substantially held that all combinations of patents were outside the Sherman Anti-Trust Act. Bement v. National Harrow Company, 186 U. S., 70, decided on May 19, 1902, was thought to declare this view. In this case, at page 90 and sequence, some peculiar limited exceptions are referred to, as, for example, a statute requiring an inspection of burning oils and providing a penalty for its violation. The opinion then proceeds, at page 91:

"Notwithstanding these exceptions, the general rule is absolute freedom in the use or sale of rights under the patent laws of the United States. The very object of these laws is monopoly, and the rule is, with few exceptions, that any conditions which are not in their very nature illegal with regard to this kind of property, imposed by the patentee and agreed to by the licensee for the right to manufacture or use or sell the article, will be upheld by the courts. The fact that the conditions in the contract keep up the monopoly or fix prices does not render them illegal."

This impression was apparently strengthened by expressions in United States v. Winslow, 227 U. S., 202, 217. It is true this case also gave effect to the fact that, on the face of the combination of patents then under review, there was an effort for greater efficiency; but the opinion continues that the machines involved were patented, and it assumes that making them was a monopoly in any case and that the exclusion of competitors from the use of them was the very essence of the right conferred by the patents. Then the opinion refers back to the Paper Bag Patent case, 210 U. S., 405, 429. There it appeared that the patent in suit had been locked up by the complainant, its owner, and that the complainant had neither used it nor allowed anyone else to use it. There was neither lack of means nor any other excuse for locking up the invention, except the desire to protect other machines which the complainant was
1442 manufacturing. After some incidental explanations, the court there said: "As to the suggestions that competitors were excluded from the use of the new patent, we answer that such exclusion may be said to have been of the very essence of the right conferred by

the patent, as it is the privilege of any other owner of property to use or not use, without question of motive." What was said there was directly in issue.

But other late decisions of the Supreme Court seem to demonstrate that the cases we have cited do not state the whole law, but only lead up to the general rule, without showing how this general rule yields to exceptional circumstances. Moreover, this position does not give full effect to the second section of the Sherman antitrust statute, which covers "every person who shall monopolize or attempt to monopolize," as well as those who combine or conspire with any other person, or persons, to monopolize. Certainly in United States v. Reading Company, 226 U. S., 325, reliance was placed at page 358 on Swift & Company v. United States, 196 U. S., 375, 396, where a plan said to consist of many parts or elements was held to constitute a monopoly forbidden by the act. There the court observed that whatever we may think of the elements separately, when taken up as distinct charges, they are alleged effectively as elements of a scheme. It is true that in the Reading Company case there was an underlying combination among the principal promoters of what resulted; but we find there this recognition of what may happen where there is no such combination, given in the language we have cited from Swift & Company v. United States.

The case, however, that controls the present proceeding in this important aspect is Standard Sanitary Company v. United States, 226 U. S., 20, decided on November 18, 1912. There the opinion was drawn by the same learned justice who drew the opinion in the Paper Bag Patent case, so that we may assume that the two cases go along hand in hand. The opinion in the Standard Sanitary Company case refers twice to the opinion in the Bement case, once at page 40 and again at page 48. At page 48 it is said as follows:

1443 "There was a contention in that case that the contract of the National Harrow Company with Bement & Sons was part of a contract and combination with many other companies and constituted a violation of the Sherman law, but the fact was not established and the case was treated as one between the particular parties, the one granting and the other receiving a right to use a patented article with conditions suitable to protect such use and secure its benefits. And there is nothing in Henry v. A. B. Dick Co., 224 U. S., 1, which contravenes the views herein expressed."

Thus the Standard Sanitary Company case and consequently the present proceeding were, and are, by express language distinguished from the Bement case, and the distinction thus made is that relied upon by the United States here, namely: Instead of dealing with one or more contracts between one or more parties, incidentally made

and having no relation to each other, we are dealing with a vast scheme which unavoidably affects the public interests. We need not elaborate other late decisions which indicate and enforce the proposition that a monopoly may be established in violation of the second section of the Sherman Antitrust act, conforming to the explanation of the Bement case which we have given, and without a formal combination; as, for example, United States v. Patten, 226 U. S., 525, 541 and sequence; United States v. Union Pacific R. R. Co., 226 U. S., 61, 85, 86; and Strauss v. Publishers' Association, 231 U. S., 222, at various points in that opinion. Therefore, in view of what we have said, it is necessary for us to go a step further and point out that we have here an organization, supported merely by a diversity of patents or machines patented in whole or in part, and inquire whether the alleged resulting monopoly is arrived at by injurious provisions contained in the licenses and leases referred to, which go beyond what the respondents might justly require.

We should now state generally that the United States claim that, while there are no contracts in form as between the different customers of the United Shoe Machinery Company, the matters are so tied together by the provisions of these licenses and leases, and ~~the~~ the scheme created thereby is so complete, as to have the same
1444 practical effect of producing the alleged monopoly which the statute prohibits, as though there had been agreements in a multiple form executed by the United Shoe Machinery Company and its various customers. They also claim that this results in a scheme such as we have already referred to. The allegations in this particular are for a large part of a very general character, and it may well be doubted whether the larger portion of them are not so general as to fail to require our attention according to the proper rules of pleading. Perhaps, however, on that score the variety and number of the leases, and of the various provisions thereof, are so great and the parties with whom the United Shoe Company have been dealing were and are so numerous, that it would be unreasonable to require the complainant to set out the facts in detail. We have, however, given the language of this part of the bill verbatim, and we can approach it with the general statement substantially in effect that there is nothing in the terms of the leases justifying any allegation indicating a purpose to enhance the cost of the machines to the users thereof, to wrong or oppress the public, or to impose any arbitrary, oppressive, or unreasonable terms.

The bill also alleges that these provisions are not found in the earlier leases and agreements existing prior to the organization of the United Shoe Company. Whether they were or not we regard as immaterial, except as excusing the respondents from any wrongful intention, because we agree with the United States in the propo-

sition that whether or not the conduct of the respondents is in fact in restraint of trade does not depend on the effect of any element considered singly, so that every element considered singly may be wholly innocent; but the question of an existing monopoly, or an intended monopoly, is to be determined by the effect of all the elements which are in fact combined.

The bill gives us no particular rule by which we can determine whether the provisions of the leases and licenses referred to are abnormal, or unjust, or unreasonable, nor where, nor how far, they are within the allowances which the law makes for the protection of legitimate trade and manufacture. We have nothing bearing directly on this topic except the apparent admission that the
1445 common provision contained in the leases and licenses, understood and called the "full capacity clause," standing alone, would be valid, and except also expressions like those found in Eastern States Lumber Association v. United States, 234 U. S., 600, 609, decided on June 22, 1914, summing up the previous decisions of the Supreme Court, that the Sherman Anti-Trust Act "in its proper construction" "was not intended to reach normal and usual contracts incident to lawful purposes and intended to further legitimate trade."

Nevertheless, we fail to find in the development of the United Shoe Machinery Company, and its operations, any support for the alleged charges in the bill of intended oppression, arbitrary conduct, or anything of that nature, especially so far as any allegations cover any attempts to destroy or cripple competitors. Looking at the great mass of facts proven in the case, and the immense number of transactions of the United Shoe Machinery Company, the evidence offered in that direction is so ineffectual that its weakness furnishes of itself satisfactory proof against what was intended to be established thereby. We find no evidence of what was shown especially in the Tobacco Company cases, namely, a purpose to destroy what could not be acquired by straightforward methods. The fact that the United Shoe Company has acquired so large a percentage of the business of the country to which it devoted itself comes so largely from the use of extraordinarily competent methods as to shut out from the eyes of the impartial investigator suggestions of other methods. So we lay aside that part of the case, and deal only with the proven facts, and the legitimate results of those facts, with little consideration, however, for any charges in this connection, or elsewhere, of intended oppression or unreasonable course of procedure, or of results which can be attributed to any unworthy motive. This, however, according to the well-known rules of law, does not necessarily relieve the respondents from what actually resulted from what-

ever they did, or from being responsible for these results so far as they might be expected to be foreseen.

The result of our consideration of what appears in the bill
1446 on this topic, and of the very general expressions found in it, and found in the authorities applicable hereto, have rendered necessary that we set out, as we will do with very considerable fullness, the claims of the respondents as to the nature and amount of the operations of the United Shoe Company, for the purpose of making clear the just amount of flexibility of the provisions of the leases and licenses as complained of by the United States, which should be regarded as applicable to what is admitted, or must be admitted, to be legitimate for the business of the United Shoe Company.

We may well call attention to some particular provisions in the leases and licenses, although they do not carry us very far towards solving the whole case before us. Among other provisions is one requiring lessees to use exclusively one or more classes of machines included in groups of machines, under penalty of having all the machines included in those of other groups reclaimed. The licenses also cover periods of not less than seventeen years, thus regardless of the unexpired terms of the patents relating thereto. Also they cover a requirement that the lessees obtain from the United Shoe Company all duplicate parts, extras, mechanisms, and devices used in operating, repairing, or renewing. With this there is an allegation that the parts can be obtained only at enormous prices. The record, as we repeat, gives us no definite rules for determining how far each of these provisions is legitimate or otherwise. It nevertheless appears that the prices for duplicate parts, and so forth, were never exorbitant, but that the contrary is true. Also it appears that, to a large extent, the requirement that duplicate parts, and so forth, should be obtained from the Shoe Machinery Company is for a large part reasonable. This and some other provisions may relate to the standardizing, and to continuous harmonious use of a long line of successive machines, for which standardization and harmonizing lie at the foundation, as they are the very life of some modern systems of production. Other allegations with reference to this topic are either frivolous or too general to support of themselves any practical results. Consequently, it becomes necessary for us to state the case more fully as claimed by the respondents, in order to attempt
1447 to furnish some tests as to how far provisions of the kind complained of are legitimate with reference to some portions of the business of the Shoe Machinery Company which everyone must admit it is entitled to pursue. The positions and peculiarities of the case are so extensive and novel that it is impossible to apply with any satisfaction any ordinary tests of what are reasonable and normal and what are unreasonable or abnormal requirements of the

leases or licenses, without a particular view thereof. The case in these respects, as stated by the respondents, has so many phases that the determination of what portions of the provisions of the leases and licenses are normal, legitimate, or reasonable as applied thereto is a complex topic, requiring much investigation, supported with great patience and care. What we now extract from the positions of the respondents in reference thereto is substantially supported by the record.

These extracts commence with the fact that the circumstances appearing in the well-known Standard Oil and the American Tobacco Company cases are so far unlike the circumstances appearing here that no particular assistance can be derived therefrom with reference to what conditions or requirements should be normal, legitimate, or reasonable here. The respondents say:

"This particular business of shoe machinery started about 1860 with the McKay sewing machine. There are men now alive who saw the first McKay machine, introduced about 1860. At the time the machine was invented by Lyman Blake there was not in a shoe factory a single machine outside of the sewing machine for stitching the uppers except a machine for making strips of outsoles and a knife organized into a frame which roughly shaped the outsole. There were a few crude pegging machines in use. There was not another machine, and shoes were made absolutely by hand. The business was insignificant as a whole even, and the individual units were most insignificant. McKay had $140,000 when he bought it. He thought that it was a perfect machine, but his $140,000 was gone before he was able to sew a shoe on it commercially. And that is the history of all these machines. They have been most expensive in their development. One unexpected failure after another has broken the hearts of the inventors and promoters before success was attained."

1448 "Then came the Civil War, and the demand for shoes for the soldiers was such that the McKay machine was able to get a start which otherwise it might not have gotten."

"At the moment when McKay started to put this machine out Elias Merwin and McKay together invented for this business the royalty system, and that system has prevailed throughout the shoe-machinery business from the beginning. It was a system of leasing machines, adopted in order that the shoe manufacturers might be induced readily to take the machines. Because in the case of each new machine it was all an experiment, the shoe manufacturers did not dare to take such machines and invest their capital in them. They did not have the capital to invest. This policy was satisfactory to the last degree, and from McKay's time to the present day the royalty and lease system has been the prevailing and characteristic

method of the shoe-machinery business so far as the great variety of elaborate and refined machines which have followed the first McKay machine are concerned. One thing which the Government asks in the case is that the leasing system which has prevailed from the start in this industry should be destroyed. If the court should declare illegal, as the United States ask it to do, the protective clauses in our leases which we have put there to make the system safe and practicable, the leasing system would have to go."

"There are two important aspects, at least, in which this shoe-machinery business is unique. One is that in every single step in this business up to the point where to-day we are building 350 machines, the machines have been patented machines, always patented and likely to be patented for an indefinite time in the future—because this art is not yet exhausted. Thirty-five millions of dollars of the property of the Shoe Machinery Company is in the hands of these shoe manufacturers. It finances them to that extent. It keeps those machines in repair, so that the shoe manufacturers have no question of maintenance; no cost of maintenance to deal with. It sees that information calculated to make the operation of the machinery more effective is collected and disseminated throughout the factories. The shoe manufacturers who deal with our company do not have to be on the watch to get the best possible machines. They know that the defendant will supply them with the best. They know that their machinery is the best in the world, and that, if
1449 better is devised, they will surely have it. There is nothing for them to look after except the question of labor, the purchase of material, the design of their goods and selling them. It is with this business, not with any other, that the court has to determine whether what these respondents have done, what contracts they have made, have been in the normal, orderly, natural line of development."

"McKay had his lasting machine; Thompson had his lasting machine; soon Copeland came along with his lasting machine; all patented; and the impression right straight through of those working in this art who were most intelligible was this, that you might do many things with machinery in shoe manufacturing, but you never could last by machinery, because you are dealing with leather, which is a most difficult thing to deal with. It is so expensive that every scrap should be saved and none injured. No two adjacent centimeters of leather are the same in character and condition. In flexibility and capacity for stretching no two spots are alike; the surface character constantly varies; and yet you must make a finished shoe without waste or loss and as perfect as possible, and the two shoes of every pair must be perfectly matched. It was the general belief that the lasting machine was an idle dream."

"But the lasting machine has come; and so has every other machine that was required in this industry. The 150 processes that are employed in making shoes are all done to-day by machinery. It is only a short time ago that there was some talk about cutting out the uppers; men said that you never could do that. Human intelligence seemed absolutely essential for the work. Now we have a machine that doubles the efficiency of the human operator in cutting or dieing out the uppers, and does it much better. This is the clicking machine."

"Moreover, the No. 5 laster of to-day is of such a character that the Ideal and the Chase of 1899 are practically obsolete machines. The welter and stitcher of to-day are enormously more useful, efficient, and economical than those of 1899, as the record shows. The rough rounder has been perfected. And so it goes right straight through with every machine in use in 1899, as to all of which there have been a long line of patented improvements, one succeeding another at frequent intervals, everyone of which does something that previously was done by hand, or was not done at all. So that to-day you have a completely developed organization of machinery
1450 adapted to the manufacture, under the most favorable conditions, of the shoes that the public require. If the requirements change, the machinery is at once changed to meet those new requirements, and there has been a continuous and large gain in economy and efficiency.

"We talk chiefly about the welt shoe, because that is the most important shoe of all and the one to which our business most largely relates. There were only 17,000,000 of them made in 1898, or less than 10 per cent of all shoes made. In 1910 there were made over 86,000,000 pairs, and the proportion of welt shoes to all shoes made has been steadily increasing. And why this increase? Because we have given to the shoe manufacturers, between 1899 and the present time, better machines and radically new machines, which enabled them to make those shoes successfully and at a low cost. We are solely responsible for this entire development. The whole credit of it belongs to us.

"Now, it is not unreasonable to look at this complex and complete shoe machinery system in this way. Take a screw machine. There there is an organization on one frame which feeds the bar, cuts off the right length, puts in the screw thread, makes the point, makes the head, and cuts the slot in the head, thus making a complete screw. The manufacture of a shoe in a modern factory is practically a unitary operation, like the making of a screw; every one of the many steps being coordinated to the others, as if all were taken in a single machine. Everything is aimed at one product, and every single machine is definitely related to the machines that follow it and to the

machines that are back of it. These machines that we have talked about as being classified into 'departments' cover sometimes machines of one department 'tied' to those of another; yet, there is no consecutive relation of one department to another in the order of use of the machines in making a shoe, but you start in with one machine from department 'A,' and take the next from department 'D,' and then one from 'C,' and then one from 'E,' the result being that, when you get through, they have all been interwoven, and the sequence worked out, not department by department, but one machine after another, in any order as far as the departments are concerned. That is, the whole is a continuous process, aimed at one unitary result; and each of the machines, whatever the distribution among the different departments, is organized to succeed the prior ma-
1451 chine efficiently, and to prepare the shoe for the next machine. Any one of the machines may spoil a shoe; and the result is that one of the great problems of this art has been to organize each machine so that not only will it do its work without injury to the shoe, but that there will be no difficulty when you come to the subsequent machines. The work of each machine must be done so that the next machine will work with the required accuracy."

That the whole system thus described, past and present, is, and has been, supported and covered by patented machinery, is shown by the extracts we have already made in that connection.

What we have submitted about the leasing system, and the propositions of the respondents which we have cited, and which cover so large a field, constitute an organization so successful in its operations, continuing so long a time, and so harmonious in its major parts, that anything which would bar out provisions in the leases and licenses necessary to the maintenance thereof must be admitted to be injurious to the manufacturers of shoes, as well as to the manufacturers of machinery, with regard to what each justly desires to accomplish. However, the numerous provisions prevailing in a very considerable variety of leases and licenses, in a very considerable variety of forms, involve so much investigation and so much study that that investigation and that study should not be claimed or expected from any court of justice as primary work, and it should first be taken in hand by a master. This proposition, moreover, is enormously enforced by the systems of standardization, and of other special peculiarities, involved in the enormous work of repairs, and incidentally of supplying parts, which the Shoe Machinery Company is now accomplishing at important but distant parts of the United States, at an annual expense said to be in the employment of over 600 men, giving their services exclusively thereto; and all to the unqualified satisfaction and the very great saving of time and

expense of the shoe manufacturers' industry. The better practice is to refer all such matters to special masters.

In this connection we make no special reference, and have come to no conclusions, in regard to the effect on the pending case of
1452 the legislation of Congress enacted since this case was submitted to us, nor with reference to the question whether or not the rights of the parties affected by this legislation would require supplemental pleadings. All such matters would primarily be a part of the special master's finding, if appointed.

We are brought next to a series of independent transactions on which the United States rely, relating to the acquisition of, and control by, the United Shoe Machinery Company of certain businesses, alleged to have been acquired for the purposes of destroying competition, and thus extending the monopoly alleged in the bill, and covering various periods from March, 1899, to the time of trial, amounting, by the schedule given us, to something more than fifty instances. Some of these on their faces are only "efforts after greater efficiency," as suggested in United States v. Winslow, 227 U. S., 202, 217, already referred to. Those that remain which are of any consequence are connected with the acquisition of patents, either directly or indirectly, and are covered by what we have already explained. Of this latter class, so far as we can understand it, is the acquisition of the capital stock of the Goddu Sons Metal Fastening Company. This case is worthy of being treated as a typical one. The transaction occurred in March, 1899, the month after the United Shoe Machinery Company was formed, and more than eleven years before this bill was filed. It related to patentable inventions for metallic fastenings. This transaction seems to be disposed of by the general propositions we have already laid down about patent rights. It also involves a complaint several times made that the United Shoe Machinery Company has taken agreements from inventors barring them from competing with it; but such agreements are legitimate in connection with sales so far as they run parallel to the sales, or wherever they avoid unnecessary competition. The law on this point, within this generation, has been extensively altered and broadened, so that now covenants of this kind may be taken coextensively with the breadth of the trade bargained for in connection with them. So far as we have been able to discover, the various agreements of the character spoken of, and included in the prosecution, have been
1453 no broader than the law now allows. There may be some minor exceptions, but they have not been brought specifically to our notice.

We come now to the transactions with Thomas G. Plant as alleged in the bill. The real life of this transaction is in what we have said about the patent rights involved here, and about the provisions of the

leases and licenses. Without those it would be impossible to construct any case of restraint of trade under the Sherman Anti-Trust Act mapped out by the bill we have before us. Without them there can be no illegal structure whatever. All the property, including that acquired from Plant personally, covered by these matters has been broken up and lost sight of as an entity, except only the shoe manufacturing business, the control of which was acquired by the control of Plant's shares of stock in the T. G. Plant Company, while the shoe manufacturing business is not within the purview of this prosecution because there is no claim of a monopoly acquired in that occupation. Whatever else was acquired from Plant was either patented machinery, or patents, or inventions which stood for incipient patents. So much, therefore, of the propery acquired from Plant, except the shoe manufacturing business property, is subject to what we have already said about patents, and the provisions contained in the leases and licenses we have referred to, incidental thereto. Moreover, as to all of these incidental matters, the learned counsel for the complainants said as follows:

"The leasing system in and of itself is not a violation of law, the acquisition of competitors was not a violation of law—the threats and intimidation of competitors did not constitute, in and themselves, a violation of law—but when all of these things are taken together they form an unlawful plan—therefore the plan will make the parts unlawful; so that if we started in 1899 with a lawful combination and that combination is used to build up a monopoly, we see no reason why the court can not go back to the original combination, and separate it for the purpose of restoring competitive conditions, because that combination has been used as an instrument for monopolizing the business."

This can justly be construed as a proper admission that the
1454 subject matters submitted by the bill are to be taken substantially as a whole; so that, if the fundamental matters which lay at the foundation on which the structure was intended to be built, go out, the whole goes out. The court is not called on to reconstruct what was intended to be built by the United States if the most essential parts of that structure have disappeared. It is well to observe that, to a stranger, the transaction with Thomas G. Plant seems a very large one; but, as compared with the manufactured product of some of the witnesses who testified in the case, it was a minor thing; and particularly so when compared with the product of 86,000,000 pairs of welt shoes in 1910, and as compared with the great transactions to which this prosecution relates.

There have been many unthinking criticisms of the respondents in this case, both Federal and State, some semiofficial, and some personal, and therefore irresponsible; but the conduct of this long and

laborious trial before this court has been a model for those who witnessed it. It has been conducted with extraordinary persistency and ability, but with fair and open hand, and constantly with that courtesy due the counsel and this tribunal.

The court having carefully considered the pleadings of the parties and their evidence, and heard the counsel, it is ordered, adjudged, and decreed that the bill of the United States herein be dismissed.

1455 District Court of the United States, District of Massachusetts.

THE UNITED STATES OF AMERICA
v.
UNITED SHOE MACHINERY COMPANY, OF NEW JERSEY, and others. } In Equity, No. 301.

[March 18, 1915.]

DODGE, J.: 1. United Shoe Machinery Company, of New Jersey, organized early in 1899 by consolidation of the properties and business of several constituent companies, is charged to have been formed in violation of the antitrust act.

This claim is based on two alleged grounds—(1) that it destroyed competition between the component companies, (2) that it was brought about with an unlawful intent on the organizers' part to destroy such competition and to use the consolidation as a step in carrying out an unlawful project formed by them to acquire a monopoly. (Petition, pp. 18, 80 of record.)

Has the United States proved that such destruction of competition resulted from the consolidation as made it a combination in restraint of trade? Taking the facts to which the evidence relates in order of time, this is the first question presented.

The restraint or monopoly alleged in the petition is restraint or monopoly of interstate commerce in "any and all kinds of shoe machinery," i. e., in shoe machinery generally.

But it appeared early in the trial that no such charge could be proved, because neither the business of the component com-
1456 panies in 1899 nor that of the United Shoe Company from its beginning until the bill was filed related to "all kinds of shoe machinery." Both were always limited to certain kinds only. This was finally conceded, and the field of trade in shoe machinery with which this case is concerned limited by concession of the complainant's counsel to machines of the following kinds: (1) Lasting or "pulling-over" machines, used for adjusting and attaching the upper of a shoe in process to a last; (2) machines for preparing bottoms and heels and fastening them to uppers; (3) machines for finishing bottoms and heels after they have been so fastened; (4) eyeletting

machines for inserting eyelets in uppers; (5) "clicking machines" for cutting out uppers. The "shoe machinery" as to which restraint or monopoly is charged, therefore, includes machines of the above kinds only, for the purposes of all questions hereinafter considered. It is to be noted that such machines are insufficient for the making of a complete shoe, and that no attempt to control machines for stitching uppers is charged.

We are concerned only with the first three of the above classes, so far as regards the above consolidation in 1899. None of the constituent companies then made or dealt in eyeletting or clicking machines. These originated with the United Company. It introduced and developed them later on, at different times during the development of its own business after 1899. Its eyeletting machines wer first produced about 1902; its clicking machines in 1908 or 1909.

The United Company was formed February 7, 1899, taking over, in exchange for its own stock, or for cash, or both, the business and property of each of the following concerns: Goodyear Shoe Machinery Company and International Goodyear Shoe Machinery Company (both in the same line of business and hereinafter together called Goodyear Company), Consolidated & McKay Lasting Machine Company (hereinafter called Consolidated Company), McKay Shoe Machinery Company (owning and controlling Davey Pegging Company and hereinafter called McKay Company). From money obtained by issue and sale of other shares of its own stock it bought in March, 1899, the stock, business, and property of the Eppler
1457 and International Eppler Welt Machine Companies. These, though strictly acquisitions of the newly formed United Company, after its formation, may, for the purposes of the present question, be regarded as constituent companies.

To allegations found in the petition (p. 18) that the business and property of the Goodyear Company, the Consolidated Company, and the McKay Company were taken over by the United Company "at values far in excess of real worth," reference is made at this point only in order to state that no proof of any kind was offered in support of them, it was not argued on the petitioners' behalf that they were true, and they therefore require no further notice for any purpose in the case. There can be no doubt that each concern had an established business already of great value and possessing great possibilities of development, or that each also owned patents and property of very great value in connection with its business.

Up to the time of their union each constituent concern had been dealing, generally speaking, in a line of shoe machinery for the most part distinct from that dealt in by the others. Thus the Goodyear concern's business had been that of making and dealing in welt-sewing and outsole-stitching machines and auxiliary machines for

use therewith, all designed for the manufacture of Goodyear welt shoes; also one kind of lasting machine, called the "Ideal," designed for lasting women's welt shoes. The machines of the Consolidated concern were lasting machines of three kinds, designed, respectively, for lasting men's welt shoes (this was called the "Chase"), heavy metallic fastened or pegged shoes, and McKay sewed shoes. The machines of the McKay concern were heeling machines, metallic fastening machines, and Davey pegging machines. The Eppler machines were welt-sewing machines and certain auxiliaries therewith used in making welt shoes (not Goodyear welts). After the union the United Company proceeded to make and deal in all the above machines.

It is here to be noted that the Goodyear welt method is only one of several methods of uniting the upper and sole of a sewed shoe.

This method was from the outset in direct competition with
1458 the McKay method, and it has so continued until the present time. The Eppler welt machine was for doing the same thing by still another method. As the McKay method is and has been open to all the world, shoe manufacturers are and have been always able to obtain machines for sewing uppers and machines (i. e., McKay sewing machines) for attaching bottoms to uppers independently of the United Company or any of its constituent companies.

The various machines produced as above by each constituent concern were, as the petition alleges (p. 15), all made "under letters patent of the United States and of other countries." The patents belonged to the respective concerns and covered improvements from time to time embodied in each machine during the course of its development by the concern producing it. Each concern had so far developed and improved its own machines that they were in 1899 the machines principally in use by shoe manufacturers throughout the United States in doing the respective kinds of work for which each was adapted as above. All the patents referred to passed by the consolidation to the United Company. Each concern had further improvements upon its machines under trial, and all the rights in these inventions also passed to the company.

The combination was not unlawful so far as it did no more than put the different groups of noncompeting patented machines into one control. U. S. v. Winslow, 227 U. S., 202. It was not unlawful unless, to an extent injurious to the public interest, it destroyed competition. In support of the charge that there was such destruction of competition, the United States contends that before the combination (1) the Goodyear Company and the Consolidated Company were competing in lasting machines, and (2) the Goodyear Company and the Eppler Company were competing in welt-sewing machines.

Unless the termination of such competition as existed between these concerns in respect of these machines made the combination unlawful, it was not unlawful because of any destruction of competition involved in it.

(1) As to the alleged competition in lasting machines, it is not claimed that there was any, so far as two of the three kinds
1459 made by the Consolidated Company are concerned. These are the "McKay-Copeland" laster for lasting heavy metallic fastened or pegged shoes or brogans and the "hand method McKay" laster for McKay sewed shoes; and neither of them could be used to last welt shoes, for which purpose alone the Goodyear Company's "Ideal" laster was adapted. The only question here is whether the latter machine can be regarded as competing with the remaining laster of the Consolidated Company (the "Chase"). With still another laster with which the Consolidated Company was experimenting in 1899 for use on welt shoes, we are not here concerned, because, though this laster was afterward further improved, developed, and finally furnished to users by the United Company, it had not been made an article of commerce in any practical sense when that company was formed.

There is no proof of any actual use of the "Chase" laster otherwise than for its intended purpose of lasting men's welt shoes. It could not work well for use with the lighter leather whereof women's shoes are made. The "Ideal" laster, used almost exclusively for its intended purpose of lasting women's welt shoes, could not be relied on to work well with the heavier leather whereof men's shoes are made. The proof relied on to show that it competed with the "Chase" went no further than to show that a number of "Ideal" machines, small in proportion to the total number then in use, were being used in a few factories on men's shoes, notwithstanding their want of adaptation to such use. That there was any attempt to put either machine into the market as against the other does not appear. No competition between the two in the usual sense of the term is shown. After the consolidation, by the addition of a patented "hold down attachment" added by the United Company to the "Ideal" in 1901 or 1902, some of the defects referred to were removed, but not until then can it be said to have been commercially successful for work on men's shoes. Before this improvement, it possessed at most a limited possibility of such use. I am unable to consider it established that competition in any practical sense was destroyed when the United Company became owner of both machines.

1460 (2) As to the alleged competition in welt-sewing machines, the question is to what extent the Eppler welting machinery can be regarded as competing with the Goodyear welting machinery.

Outside of that produced by these two concerns, no other welting machinery appears to have been on the market at the time.

The Eppler machines were adapted to produce men's thick-soled welt shoes only. They could not produce women's welt shoes (except perhaps those having the thickest soles), nor turn shoes of any kind, nor Goodyear welt shoes, either men's or women's, because of the difference between the respective machines in the character and position of the seam left in the inner sole of the shoe. The Goodyear machines could produce shoes of all the above kinds. The differences referred to resulted from differences in the character and operation of the machinery belonging to the different systems. These differences in character and in possible field of use had resulted when the United Company was formed in 1899 in the fact that over 2,500 Goodyear welting machines were in use, as against thirty or forty Eppler machines, one-third of these being used in the factory of the president of the Eppler Company. The evidence leaves me unable to believe that the possible field of competition between the two machines was large enough, or any actual existing competition significant enough in amount to warrant the conclusion that the acquisition by the United Company of both machines involved such destruction of competition as rendered it unlawful. The Eppler machines were not suppressed by the United Company. It continued to supply them until the progress of improvement in such machinery superseded them. The patents covering them have long since expired, and it is open to anyone to make and use such machines if he desires. There is no present monopoly in them, and no action taken by the court could restore them to the field of competition, or encourage or create competition by them.

Nor, if such competition as is shown to have existed between the "Chase" and the "Ideal" laster be taken together with that shown to have existed between the Eppler welting machinery and the Goodyear welting machinery, do I find it credible that the avoid-
1461 ance of both amounted to a consideration of any substantial importance, so far as the formation of the United Company was concerned. No reason appears for supposing that the real purpose for which the constituent companies were brought together, as disclosed not only by the evidence regarding all the circumstances as they existed in 1899, but by the evidence as to the course of development thereafter pursued by the United Company, was other than that stated in a circular letter to the Goodyear stockholders issued February 8, 1899, the day following the organization of the United Company. (Petitioner's Exhibit 152.) This dwelt upon the advantages to be secured by putting into one control "the most efficient types" of shoe machinery. In U. S. v. Winslow, above cited, which was decided more than a year after the present bill was filed, it was

said that the combination here in question was, on its face, "simply an effort after greater efficiency," and the legality of combination for such a purpose is fully recognized.

Under their respective patents upon the "Chase" and the "Ideal" lasters there was litigation pending in 1899 between the Consolidated Company and the Goodyear Company, each claiming that the other's machine infringed its patents. Also, under the patents covering their welt-sewing machines there was similar litigation pending between the Eppler Company and the Goodyear Company. A result sought to be attained by both parties to these controversies, and accomplished by them through the acquisition of all the patents by the United Company, was the termination of all this litigation. Reference is made below to other later acquisitions by the United Company, an important feature of which was that litigation, troublesome and expensive on both sides, was avoided or terminated. In so far as any of the defendants' transactions were in order to accomplish results of this kind, it can not be said that their purpose was unlawful.

For the reasons stated, I am unable to find the charge that the United Company was unlawfully formed because of competition which it destroyed sufficiently supported by the evidence. It would, in any case, be difficult to regard this as sufficient ground for a decree dissolving the company into its component parts
1462 under a bill not filed until more than twelve years had passed since the combination complained of was accomplished. During this period, as the evidence shows, investments of a very large amount had been made, not merely by the defendants but also by the outside public, in the extension and development of the company's united business, the component companies passed out of existence, and the machines as made by them in 1899 were so far developed, improved upon, or added to by the United Company as now all to have become obsolete. To put the parties or the public back into that state of the prior art which existed in 1899 is, of course, an impossibility.

2. Coming next to the question whether or not it has been proved that the United Company was formed with an unlawful intent on the part of its organizers to destroy competition in the future and use the consolidation they then effected as a step in carrying out an unlawful project to establish a monopoly, we are brought to the consideration of the acts and doings of the United Company, or of the other defendants through its means, from the time it was formed until the filing of this petition in December, 1911. It appears that the United Company itself and what has been done in connection with it during that period has been under the control, speaking generally, of the same defendants who brought about its formation in

1899. Of their actual intent in forming it and in taking the various steps which they have taken as above in connection with it, there is no direct proof overcoming their denial that it was such as the petition charges, and no way of judging except from the necessary results of all the steps proved to have been taken by them, as a whole.

But it is important at this point first to determine how far certain allegations of the petition, which characterize the defendants' alleged project and their motives for forming it, have been sustained by the evidence. These are found on pages 15 to 17 of the record, and they are, in substance, that the component companies were in 1899 manufacturing their respective machines and parts thereof under patents: that "many of the basic patents on the principal machines were about to expire": that their manufacture
1463 and use was thus about to become open to the public "in the near future," and that the defendants, not being satisfied with the rights they had enjoyed under the patents and intending to expand and perpetuate them to the public detriment, devised the alleged project of acquiring a monopoly which the petition thereafter describes.

This trial began on May 20, 1913. On June 27, 1913, the petitioner, having introduced substantially all its other direct evidence, stated that it desired to offer proof in support of the allegations just referred to, but was not then prepared to go into the matter.

By consent, an order of reference to a special examiner was thereupon entered (pp. 262 T. 1996) for the purpose of taking such evidence as either party should offer regarding those allegations, out of court. Such evidence was required to be completed by October 11, 1913, but successive extensions of the time were afterward found necessary and allowed by consent. Before the examiner the petitioner did not complete its direct evidence until October 6, 1913, and the evidence on both sides was not completed until November 19, 1913.

At the final arguments, however, on June 2, 1914, the statement was made by petitioner's counsel that so many machines and patents were involved that examination of more than a very few had been impossible. It seems obvious, therefore, that the allegations in question could not have been founded, when they were made, upon any adequate or complete investigation of the facts.

Nor can it be said that they have been sustained by the evidence before the examiner. It seems unnecessary to spend time in considering what patents could and what could not properly be regarded as "basic," in view of the fact that, of the patents principally relied on as such by the petitioner, those protecting the welter and stitcher of the Goodyear Company, there were two, one upon its welter, the other upon its stitcher, which ran until 1908 and 1909, respectively.

The petitioner's final position, indeed, as to what was proved by the evidence before the examiner, was by no means that taken in the allegations referred to, but was only that the two machines above mentioned, and others protected in 1899 by patents not insisted on
1464 as "basic" patents, became free to anyone to make or use—without any of the patented improvements added to them by the United Company since 1899, but nevertheless capable of successful commercial use—before the filing of this petition in 1911. In view of all the above, I must regard the allegations here in question as not sufficiently supported by proof; and hold that no such motive is shown to have prompted either the organization of the United Company, or any of its subsequent doings. The effect of the evidence and of the petitioner's argument is to show that Goodyear machines of the old type are capable of commercial use and could have been made by anyone who chose to make them. That after the expiration of the two so-called basic patents machines constructed according to them were not used is sufficiently accounted for by the superiority of the newer machines which the defendants had introduced. For that reason the older machines did not enter into competition with them, and the defendants can not be charged with suppressing such competition.

3. The combined business of the component companies as conducted and developed since 1899 by the United Company, related most largely to the machines used in producing welt shoes. The use of such machines (and thereby the production of and demand for such shoes) is shown to have been very greatly promoted by patented improvements made upon the machines of 1899 by that company, greatly increasing their efficiency and capacity, and by improvements effected by that company since 1899 in the methods of manufacturing them. It appears that the total number of welt shoes produced in his country in 1899 was about 17 million pairs; in 1910 about 86 million; the total production of all kinds of shoes increasing during the same period from about 175 to about 280 million; the Goodyear welt shoes being all this time in direct competition with the McKay sewed shoe.

It is further shown that the above improvements in the machines and their manufacture were accomplished by means of constant investigation, experiment, testing, and invention by competent experts employed by this company, involving a very large expenditure on its part. These efforts were directed not only toward
1465 making each machine as efficient as possible by itself, but also toward increasing its efficiency for so performing its own operation upon a shoe as best to combine it with the work upon the same shoe by the numerous other machines required for performing the remaining necessary operations, in order that all the many suc-

cessive operations performed should cooperate toward the most economical and efficient accomplishment of the best final result in product. And besides thus developing and improving the machines of 1899, the company kept pace with the requirements of manufacturers by the invention and production of many other machines or improvements, unknown in 1899, as the need for them became apparent.

There is no question that the above-described development of the United Company's business has resulted in a very great commercial success. Its machines, as was the case with those produced by the component companies in 1899, have ever since been those which shoe manufaturers in general can use to the best advantage and therefore prefer. The increase in the number of its machines in the hands of users has been very large. Nor is there any question that of all the machines, of the kinds to which this case relates, in use when the petition was filed, those of the United Company constituted all but a very small proportion.

It is nevertheless true that, considering the whole field of machinery for stitching together the bottoms and uppers of shoes, there has all the time been free competition. The use of other machinery to accomplish the purpose has always been open to shoe manufacturers. In that part of the field of trade in shoe machinery to which the case is now limited as above, the defendants have been not monopolists but competitors. Their only means for holding the field have been legitimate means—better machines. Their specialization in machines for bottoming shoes, and not a monopoly of such machines, has been the cause of their success.

No support is found in the evidence, for the charge in the petition (Par. X) that "enormous and unreasonable profits" have been made.

This allegation is made in connection with and apparently
1466 depends upon the allegation of which, as above stated, there is no proof, that the properties combined in 1899 were taken over at excessive valuations. Nothing shown by the evidence warrants the conclusion that profits unreasonably out of proportion to the extremely large cost at which the business has been developed and is maintained, the great investment of capital it has required, and the enterprise, inventive skill, and business ability devoted to it, have been realized. Nor has it been made to appear that the charges made for the privilege of using the machines are exorbitant or unreasonable; especially in view of the great benefit to manufacturers using them, in lessening their cost of production.

If there is any sense in which the result attained as above can be called a "monopoly," it does not follow, in view of the circumstances shown, that the defendants have either restrained trade or been guilty of monopolizing or attempting to monopolize within

the meaning of the act. Nor can I regard the case as one in which any presumption arises, from the fact that so large a proportion of the users of these machines use the defendants'—that the defendants have committed any of the above forbidden acts in accomplishing the above result. The proof is too complete that it has been in fact reached by the use of methods entirely lawful, the leading features whereof are below indicated. As has been said, the field they have occupied is a special field, and the product for which their machinery is adapted is of higher price and quality than the product of the machinery of others.

The business which the defendants have developed and established is not, and has never been, one in which everybody might freely engage. No one else could lawfully make or use machines containing improvements covered by the defendants' patents. Nor can it be said that the demand for such machines which they have supplied existed independently of the defendants; on the contrary, they have created it by the new methods of shoe manufacture which their improvements have educated and enabled manufacturers to follow. It cannot justly be said that the case is one in which a field of commerce normally belonging to all has been captured by a single concern. The principles applying in such cases can not justly be applied here. In so far as the defendants' occupation of
1467 the field has been due to the greater desirability of their patented machines and to the superiority of their methods of making and supplying users with such machines, no reason appears for holding it unlawful, whatever its extent.

Supplementing the production and development of its various patented machines, methods introduced by the United Company for keeping them in efficient operating condition while in the hands of their various users throughout the country have most effectively aided the development of its business. It has undertaken not only to train operatives in the proper use of the machines and to secure the prompt repair of any machine disabled in use, but also to supply each user from time to time with the latest improvements, either by adding them to the machines or by substituting improved for superseded machines, without extra cost to the user. This service it has furnished by maintaining at central points bodies of competent employees who attend to the above matters whenever and wherever they are notified by users that such attention is desired.

A system of standardization, introduced since 1899, whereby corresponding parts of the various machines have been so constructed as to be interchangeable whenever possible, has, in connection with the service furnished as above, effected a great reduction in the time lost by machines in waiting for repair. The introduction of such a system could not have been effected by the component com-

panies because each carried on the manufacture of its machines at a different place. While each of them rendered to its users some service of the character described, this was done to a limited extent only, and the maintenance of any such system of rendering it as the United Company has pursued would have been impossible to them because of the heavy outlay involved.

The service secured to users of the machines by the system just described has been furnished to users without charge in addition to the royalties paid by them under the leases of their machines. For duplicate parts, extras, etc., required in operation, repair, or renewal, the terms of the leases required payment. Allegations in the petition that exorbitant prices were charged for such duplicate
1468 parts, etc., were not sustained by the evidence, and have not been insisted on in argument.

That the degree of success attained and the preponderance in number of users supplied which the United Company has secured are fully accounted for by the superior efficiency it has developed in its patented machines for work in combination with each other, together with the superior facilities it affords as above for their most efficient use, must be regarded as shown beyond question. It is not disputed that, when the petition was filed, its machines represented, in number and amount, the highest development ever reached in the art to which they belong; or that they are most in demand by manufacturers of the higher grades of shoes for that reason.

So little room for doubt does the evidence leave that the success and preponderance referred to are the natural and legitimate result of the intrinsic merit of the patented machinery and service furnished as to require clear and convincing proof of any assertion that they are due to causes other than these. It can not be said that of themselves they justify any such presumption that unlawful means have been resorted to in attaining them, as has been held to exist when, in a business whereof no lawful monopoly is possible, because it is normally open to all, the success of one competitor has been attended by the disappearance of such competition as previously existed.

4. The petition charges the United Company with acquiring and absorbing the business of sixty different concerns or persons, described as "competitors," in pursuance of their alleged unlawful scheme, and as one method whereby what is called its "monopoly" has been built up. The nature and circumstances of these transactions are next to be considered.

As to one of these concerns (Boston Blacking Company), also made a defendant in the case, the charge was withdrawn early in the trial and the petition dismissed by consent so far as it is concerned. (Record, p. 261A.)

The petition has also been dismissed as against two other concerns also made defendants (J. C. Rhodes & Company and
1469 Thomas G. Plant Company)—though the charge regarding the acquisition of their business is still urged against the remaining defendants. The transaction involving the concern last mentioned requires consideration by itself. The fifty-eight remaining charges of unlawful acquisition may be more generally dealt with.

The fifty-eight concerns or individuals referred to made transfers to or agreements with the United Company at one time or another during the years 1899 to 1910, inclusive; and the transactions related more or less immediately to shoe machinery in general if the term be taken in its most inclusive sense. So far there is no dispute.

Eleven of the transactions were at various times in 1899; eight in 1900; six each in 1901 and 1902; three each in 1903, 1906, and 1908; nine in 1904; one each in 1905, 1906, and 1909; five in 1910. Though thus extended through a period of years, and though widely varying each from the others in character, both in respect to the nature of the transaction itself and also regarding the circumstances attending it, the petition sets them forth as if all had been in pursuance of one and the same scheme; there described as a scheme to control shoe machinery in general, though now called a scheme only to control the particular classes of shoe machinery before mentioned.

The nature of some of these acquisitions may be regarded as enough of itself to prevent them from being called indications of a purpose to control any of the particular classes of machinery now important, however it might have been were the scheme now asserted the one originally alleged for controlling all shoe machinery in general.

This seems clear in the cases where the business of concerns engaged in selling sandpaper, or in making patent brushes, or in making peg wood, was taken over; and hardly less clear, without further evidence, in the cases where the business acquired was making wire and spare parts for use in an obsolete metallic-fastening machine, or making treeing machines and parts thereof, or making needles, awls, and rawhide mallets, or making nails and tacks, or dealing in
1470 cement, blacking, and second-hand sewing machines, or making metallic heels and counters to go outside the shoe whereon they were used.

The business of four of the concerns acquired is described in the petition as that of making eyelets, enameled or not. Neither is alleged to have been making any eyeletting machine. The eyeletting machinery wherewith we are concerned, however, has been repeatedly described by the petitioner as machinery for inserting eyelets in

uppers; i. e., such as the machine first leased by the United Company in 1902.

To the cases wherein inventions or machines for pasting outer leather to linings or for cementing fabric to uppers were acquired little significance can be given, in view of the petitioner's abandonment of the claim of any scheme to monopolize machinery for producing uppers.

In several others of the transactions specified there was no acquisition of any tangible property whatever. These consisted of contracts only, either contracts for employment by the United Company or contracts in which undertakings by it were accepted in substitution for obligations previously assumed by one of the component companies. In none of these cases is it made to appear that the party contracted with was a "competitor" in any kind of shoe machinery, or that the business of any such "competitor" was "absorbed."

There remain a number of instances involving the acquisition of patent rights, patents, or machines relating to or capable of being included within some of those kinds of shoe machinery whereto the case is restricted as above. In the larger portion of these the device or machine acquired is shown to have been of a kind not then being produced by the United Company. There being nothing unlawful, as above stated, in the acquisition of different groups of noncompeting patented machines, it is clear that by such enlargements of the United Company's field of operation no "competitor" can be said to have been absorbed or driven out of business, and that no reason appears for holding the acquisitions thus made unlawful either in themselves or because made in furtherance of an unlawful purpose.

1471 The instances then remaining in which the United Company was at the time producing or trying to develop for production a patented machine for doing work more or less similar to that for which the invention of the machine acquired was intended, are the only ones capable of being regarded as of any possible significance for the purposes of the petitioner's case. In all such cases it appears that the acquisitions made were of patented improvements, whether or not embodied in an actual machine, enabling the United Company to increase the efficiency of its own machines, or to complete the development of others with which it was then experimenting or had not yet succeeding in rendering commercially successful.

No case, however, is found among the acquisitions of the character last described wherein it has fairly been made to appear that actual competition existed between the device or machine acquired and any machine then being produced or experimented with by the United Company, of such consequence as justifies either the con-

clusion that the acquisition was for the purpose of suppressing such competition, or the conclusion that a material restraint of trade was thereby accomplished. In most of the cases of this sort the machine or device acquired was claimed to infringe patents belonging to the United Company, or the patent acquired was one which some machine belonging to it was claimed to infringe, or the application acquired was in interference with applications of its own; and the object of the acquisition is shown to have been the avoidance or compromise of pending or threatened litigation. In such cases it is still less possible to say that any wrongful absorption of a "competitor's" business has been proved.

The acquisitions above regarded as the only ones of any possible significance in the case were made at various separated times during the period of eleven years or thereabouts above referred to. It can not be said that the later ones were in contemplation when the earlier acquisitions were made, because there is nothing to show that the circumstances attending any of them were such as could have been anticipated as likely to occur at the time of the preceding acquisitions. The most that can be said is, that as, in the progress of events, the needs of the United Company became
1472 manifest and these opportunities presented themselves, they were availed of.

Taken together, the acquisitions of this class are, in importance and amount, only of a consequence relatively small in proportion to the entire field then lawfully belonging to the United Company. It does not appear that they contributed anything essentially important to that degree of commercial success obtained by the company as above. If they assisted in obtaining it, it was by assisting the development of the machines to whose ultimate efficiency it was due. It can hardly be said as to any of them that they afforded anything more than a basis whereon to build. Speaking of them generally, it may be said that the invention or machine obtained required further development in the company's hands before it could be properly used. Thus in the case of the Goddu Company, the first instance of alleged unlawful acquisition specified (p. 28), the metallic fastening machines acquired by purchase of a controlling interest in the company were none of them in the hands of users; their then state of development does not appear to have been such as made them capable of commercial use, whatever the merit of the inventive ideas they sought to embody; nor is the evidence sufficient for a belief that without reconstruction, radical in character, anyone could have used them as competing machines. In not a few of the cases specified the patent or machine, being wholly experimental when obtained, proved an ultimate failure so far as commercial success went, not-

withstanding much time and money expended in the attempt to develop it.

It further appears that, during the same period of time the cases wherein the business of a concern producing shoe machinery was offered to the United Company and refused by it were far more numerous than the cases of acquisition specified by the petitioner. As to several, at least, of these instances of refusal, the evidence warrants the belief that the business offered and refused much exceeded in importance to any such scheme of monopoly as now charged, any of the specified acquisitions. The cases in which inventions were offered and refused during the same period were many times
1473 more numerous than the patents or inventions acquired. If a monopoly of all machinery for attaching bottoms to uppers was really undertaken, it is hard to believe that opportunities would have been neglected, as they were, such as those for acquiring the Union lock-stitch machines or the welters and stitchers of the R. H. Long Company, all of the unpatented machines for use on welt shoes; or for acquiring a considerable business in producing McKay sewing machines, though these were unpatented and not capable of use on shoes of that kind.

The petition charges generally that covenants in writing were taken from substantially all those whose business was acquired as specified, (1) not to engage for long terms of years in competition with the defendants in commerce in shoe machinery, (2) to convey all inventions or patents in shoe machinery which they might make or acquire during such terms to the defendants.

These charges are not justified by the documents themselves, which have been produced. They are by no means uniform in their terms, there was no generally prescribed form for them, nor were they all the work of the same hands. Each was framed according to the circumstances of the particular transaction. In many cases, at least, the agreements required only that there should be no competition in the line of business involved in the particular transaction, or that all patents or inventions thereafter made in the particular line to which the acquired invention belonged should be transferred. There are enough of the agreements in these cases which are without covenants of the kind described, to leave the allegation unjustified that such covenants were required in substantially all. And of the instances wherein covenants are found in any degree answering the alleged description, it may be said generally that none are clearly shown to have exceeded what the law permits. Still less reasonable would it be to regard what is found in them as indicating a consistent purpose on the defendants' part to exclude all those with whom the agreements were made from all possible future competition with the United Company.

An allegation in the petition that the business of many competitors was bought at exorbitant prices, fails of support in the evidence relating to any specified instance of acquisition among those
1474 thus far considered. As to them, indeed, no claim of the kind seems to be seriously urged.

5. The acquisition in September, 1910, from Thomas G. Plant, consisting principally of a large number of patents, or applications therefor, relating to shoe machinery—machines embodying those inventions and Plant's controlling interest in the stock of the Thomas G. Plant Company, a shoe manufacturing concern, is the most important in amount of the acquisitions specified, and the one most relied on by the petitioner.

According to the petition, Plant was a competitor of the defendants, and they acquired his business in pursuance of their unlawful purpose.

The evidence does not show Plant to have been a competitor in the ordinary sense. He was not carrying on any going business in shoe machinery. He was neither producing his machines nor supplying them to users upon any commercial scale, nor was he prepared so to supply them, though he had issued an illustrated catalogue of them. The petition alleges that he had been inventing and patenting his improvements for at least two years before 1910. In one factory only were machines embodying them being operated; this belonged to the Thomas G. Plant Company, whereof he owned a majority of the stock. He installed them there in May, 1910, displacing the United Company's machines previously used there in order to do so. Before he installed them there, he had offered to equip two other factories with them without requiring royalties for their use, but these offers had been declined.

There is uncontradicted evidence of declarations by Plant in 1909 that his intention was to equip these two other factories and his own with his new machines and then sell out to the United Company. That the effecting of such a sale, and not any actual competition in the market with machines then in use, was his real purpose, is hardly left doubtful by the history of his subsequent negotiations with the defendants. These, set on foot by him and at first stopped by the defendants' unqualified rejection of his proposals, he persisted in renewing, through various intermediaries, until they resulted in the purchase above described. It appears
1475 without contradiction that Plant was for a time under agreement to pay an influential shoe manufacturer, whose assistance he procured, $250,000 if he succeeded in bringing about the desired sale; also that he later offered and ultimately had to pay a commission of five per cent on the price obtained to another intermediary who undertook to put the transaction through for him.

The evidence regarding Plant's negotiations with the defendants sufficiently proves that they were never sought by the defendants and that there was never any attempt on their part to get Plant to sell them his inventions or machines or anything else: but that, on the contrary, all the efforts toward such a purchase were made by him. The first overtures toward it came from him: he began them soon after he had put his machines into the Plant factory: they led to interviews, all of which he sought and at which his proposals were declined without encouragement to renew them. Nowhere in the evidence is any indication found that before Plant's overtures were thus made any purchase whatever from him had been suggested to or considered by the defendants.

Whatever the merit of Plant's inventions, these machines in which he had first embodied them are not shown by the evidence to have been commercially successful in September, 1910, or to have been capable of such success in their then stage of development. They are shown to have been lightly built, not adapted to produce men's shoes, and by no means satisfactory in making women's shoes, the kind of work to which the Plant factory was devoted. The evidence is uncontradicted that, while operated there, they fell behind the United Company's machines, which they had supplanted, in efficiency—that breaking down and defective work was more frequent with them—and the cost per pair of making shoes with them distinctly greater. Though some of them, as later developed and improved by the United Company, proved to have merit, the most that can be fairly said of them in 1910, on the evidence, is that they were more or less promising experimental machines. There was no complete set of them for combined operation: for that purpose several important machines were yet to be developed. In the state in which the
1476 United Company took them over, they were not found capable of profitable use. Nothing is found in the evidence which affords reasonable support for the petitioner's contention that they were "right at the threshold of extensive competition with the United Company."

The petition alleges that a group of shoe manufacturers were in conference with Plant, in Boston, in September, 1910, "with a view to purchasing an interest in his inventions and machines, or to make some arrangement which would enable them to obtain machines for use in their factories and thereby be relieved from the domination and control of defendants." It further alleges that the defendants were "advised of the purpose and intent of said manufacturers," knew that if they succeeded in making arrangements with Plant there would be further removal of their own machines and competition thus created, and agreed with Plant upon the purchase made from him, in order to prevent such competition.

But the evidence fails to support these allegations. It does not charge the defendants with any knowledge, at the time they came to terms with Plant, of any negotiations between him and the manufacturers referred to. No reference appears to have been made to them or their doings during the defendants' negotiations with Plant, and no reason is found to believe that apprehension lest he might conclude some arrangement with them induced in any degree the defendants' final agreement with him. Were it important, it might be added that so far as the evidence can be said to show anything regarding Plant's intentions toward them, it shows that he never really meant to enter into any arrangement with others if he could get the defendants to take off his hands everything which he desired to sell; and no purchase so extensive as this appears to have been at any time contemplated by the manufacturers mentioned in the petition.

The terms finally agreed on with Plant were so much more favorable to the United Company than any he offered when he first approached them, and so inconsistent with his previous attitude toward them, as to leave no reasonable ground for believing that the defendants had ever sought, expected, or planned for the transaction
1477 as carried out. And in what they were thus unexpectedly enabled to acquire from him, there was included so much that was plainly of far greater consequence to them than could have been the avoidance of such competition as they can reasonably be supposed to have apprehended from his incomplete and undeveloped line of inventions—patents and machines also included—as to leave no sufficient ground for believing that avoidance of competition was their principal motive in accepting the opportunity offered. The normal, natural, and obvious business reasons, of wholly different kinds, why they should accept instead of refusing it, appear to have been so complete and sufficient as to render the conclusion unreasonable that it was accepted in order to escape competition.

Six million dollars, half in cash and half in United Company common stock at twice its par value of $25, was the price finally accepted by and paid to Plant for everything acquired from him. In the transaction no separate valuation was set by the parties upon the inventions, patents, and machines transferred distinct from that of the controlling interest in the shoe manufacturing establishment. That part of the acquisition is, of course, beyond criticism so far as the antitrust act is concerned. That it was of great value is shown beyond question by the dividends then and afterwards paid on the stock acquired by the United Company. These and the ultimate disposition of the stock itself afford every reason to believe its actual value when acquired sufficiently great to reduce the actual cost of the patented improvements also acquired to a comparatively small

proportion of the total payment made to Plant. Taking the transaction as a whole, if the total amount paid by the United Company was large, the total value of all that was received in exchange also appears, not as matter of opinion merely, but by actual results shown, quite sufficient to negative any claim that the defendants paid an exorbitant price for what they got.

The evidence that among these patented improvements obtained from Plant there were enough of sufficient value, in the defendants' hands and used as they only could have used them in further developing and perfecting the machines they were then producing or trying to produce, to make this part of the total acquisition
1478 extremely profitable to the United Company was not met by any sufficient proof to the contrary. The agreement to take the patents and inventions was not made until after a careful examination and report as to their merits. The belief thereon founded that, used as above, they would be worth acquiring upon the terms proposed, is shown to have been justified by the result, and the acquisition can not be criticised so far as it was occasioned by that belief. As developed and added to its own machines by the United Company, some of the inventions acquired have proved to be of a value such as fairly justifies their claim that the patents acquired were the controlling feature of the purchase.

The evidence shows also, without serious contradiction, that one result of the bargain made with Plant was to relieve the United Company from an amount of litigation, then pending or in prospect, which would otherwise have burdened and hindered it to an extent far greater than it had ever had reason to apprehend from any litigation with which it had before been concerned.

A suit by it to restrain the Plant Company from breaking the leases of its machines, displaced in order to instal the Plant machines as above, had been pending since May, 1910. And between Plant or concerns wherewith he was identified and the United Company there were pending interferences, claims of infringement on both sides, and pending infringement suits, raising questions relating to his or its patents, so numerous, complicated, and important as to threaten interminable controversy.

It was part of the bargain with Plant, or followed from it as a result, that the above controversies were settled or avoided. That the prospect of accomplishing this result was a further normal, natural, and powerful inducement to the agreement made with him can not be reasonably doubted. In so far as the agreement was thus intended, no criticism of it can be valid.

The above reasons, none of them open to any charge of illegality, seem to me to have been the really operative reasons which must

have induced the defendants to enter into the Plant bargain upon the terms which he finally offered them. They appear so adequate as legitimate business reasons for doing this as in my opinion
1479 to leave no reasonable ground for holding, against the defendants' denial, that it was really a purchase to suppress competition. No such competition or prospect of competition at the time is proved as would justify such a conclusion. The competition threatened by Plant and his efforts to induce the defendants, in order to avoid it, to buy his machines and patents by themselves were wholly ineffectual. They met with nothing but refusal on the defendants' part to consider his proposals. It was not until he offered, through the intermediary he last employed (Smith), the shoe manufacturing business of the Plant Company as well that the defendants consented to deal with him.

While it may have been his plan to realize a profit by threatening competition, it was not until this proposition, based upon tangible property of substantial value and of patent rights, was made, that any sale was effected. The property acquired being proved to have been worth the amount paid, the argument that the defendants were so anxious to hold a monopoly as to be willing to pay $6,000,000, or any other large sum, in order to get rid of a competitor, or that this was done in pursuance of a general plan conceived in 1899, fails completely.

6. In paragraph VI of the petition a variety of acts described as "unfair and monopolistic" or "oppressive" are charged to have been committed by the defendants since the formation of the United Company by means of the predominance it has acquired. Of these, as set forth, "threats" of various kinds form a considerable proportion. It is charged that by "misrepresentations and threats" the defendants have induced competitors' customers to leave them, and have deterred others from attempting competition; also that they have threatened to use their financial or other power to secure to themselves the patronage of competitors. Under the above paragraph heading it is also charged that the defendants have bought up many patents for valuable inventions and held them long in disuse; that they have offered and granted rebates to such users of their machines as use them exclusively; and that they have bought out many
1480 competitors at exorbitant prices. There is a general charge of "many other unlawful acts too numerous to specify," and accordingly not specified in the petition.

A long bill of particulars, containing alleged specifications of these charges, was filed upon the defendants' motion during the trial (June 25, 1913). But there are very many of the charges so specified in support of which no proof whatever has been offered. Of those to support which some evidence was introduced, compara-

tively few have been insisted on in argument. The charge that competitors have been bought out at "exorbitant prices" is found not established in the case of the Plant acquisition, as has just been stated. Nor is evidence found sufficient to establish it in the case of any one of the numerous minor acquisitions specified in the petition. It has not been insisted on in argument that this charge is proved as to any one of them.

Nor has there been any evidence sufficient to show a practice followed by the defendants of buying up patented inventions to hold in disuse. This charge also is one not insisted upon in argument.

The charge that rebates have been given to exclusive users of the United Company's machines rests upon (1) the vote of the executive committee January 29, 1900, (2) a circular letter addressed on the company's behalf to its lessees ten years later, June 10, 1910. There is nothing sufficient to show that there was anything "unfair or monopolistic" about either the vote or the letter, or about anything done in pursuance of either.

The vote of 1900 was that royalties on the Gem insole machines be rebated to exclusive users of the company's machines. It appears that having acquired the Gem Company, which had machines in use under lease at the time at a royalty of one-half cent per pair, the United Company added the machine to its Goodyear auxiliary set, and to users of such sets paid back the one-half cent per pair in order to leave the rate upon the entire auxiliary set the same as before it included the Gem machine.

As to the circular letter of June, 1910, it announces the company's intention of investing fifteen per cent of the royalties paid by lessees of the Goodyear welting, stitching, and turn-sewing
1481 machines for three years in the company's common stock, and of distributing this stock proportionately at the end of the term among those lessees who should have faithfully observed the covenants of their leases during that period.

Neither of these acts on the company's part can be said to answer to the terms in which the charge of offering and granting rebates is made. That either act was inspired by the purpose of giving exclusive users of the company's machines an unfair advantage over those who did not, or that either had that effect, can not be said to have been proved, and the charge is not believed to require further notice. It would seem to have been suggested by those cases relating to railroads wherein "rebate" has acquired an obnoxious signification.

It remains to consider how far the evidence proves the defendants to have used "threats and intimidations" of the various kinds described in the petition. As to far the greater part of the specified instances set forth in the bill of particulars, the charges of this kind

have been allowed to go wholly without attempt at proof. Of those regarding which any such attempt was made, six only have been insisted upon in the petitioner's briefs or argument. No reason whatever to believe that any greater significance could be claimed for any others of the specified instances than for these appears from the evidence regarding them to be found in the record.

Mr. Winslow, president of the United Company, Mr. Barbour and Mr. Hurd, vice presidents, all of them directors, are the only defendants charged in these instances with using any threats or intimidations. The other persons charged with making them are Mr. Bayley and Mr. Willson (since deceased), managers for the company at various times, but never made parties to this suit.

The only "threats" which Barbour is charged with making are testified to by James N. Darrah, vice president in 1900 of the Standard Shoe Machinery Company. According to Darrah, Barbour, at a talk in New York in April of 1900, tried to get him to sell out stock in his company by telling him, in substance, that if competitors of the United Company could not be bought out they would be
1482 forced out. Barbour has denied that any such conversation took place. Darrah's evidence was not corroborated; and there is no proof that his concern, though it went out of business in 1901, was ever forced out or crushed by the defendants.

Mr. Winslow is charged, in testimony by Charles H. Morse, with having said to him at some time in 1901 or 1902: "You don't suppose we are going to allow you to put them on the market"—referring to certain pegging machines then being made by the Fifield Company, with which Morse was connected. Morse, on his own testimony, was then negotiating with Winslow about a sale of the Fifield Company business to the United Company, but they failed to agree as to price. Its business was sold in 1906, but not to the United Company. There is nothing to prove that the United Company ever interfered with the marketing of this machine.

Mr. Winslow is also charged, in testimony given by Charles S. Johnson, with having said to him during negotiations in 1902 or 1903, regarding a sale of the Tripp Giant leveler, in which he was interested, to the United Company: "You had better sign that contract, because we are going to have your business anyway." But the negotiations did not result in a sale, and the Tripp Company's business, though sold out in 1905, was not acquired by the United Company. Not long after, according to Johnson's testimony, the United Company put on the market machines considered by him to be substantially the same as the Tripp Giant leveler, but there is no other indication of any interference with the Tripp Company or its business by the defendants.

Mr. Winslow is also charged, in testimony given by Merrick and Luitweiler, president and treasurer of the Union Lock Stitch Company, then developing machines not yet put on the market, with having told them in 1905, while attempting to persuade them to sell out to the defendants, that they would not be allowed to make any money; that the United Company would build their machines; that their business would come round to it and be taken by it, and that it was cheaper to kill competitors than to acquire them. The alleged statements are denied by Winslow. The business referred to
1483 is one never acquired by the defendants, nor is any interference whatever with this business shown. This was admitted, and the testimony of the two witnesses named is that they have put out 350 to 400 of the machines in question.

Bayley, a department manager for the United Company, is charged, in testimony given by Irving A. Hadley, then representing Kimball & Hadley, manufacturers of awls and needles, with having said to him in January, 1904, in answer to a claim by him that Kimball & Hadley could sell needles as cheap as the United Company, that the United Company could give them away if necessary.

It does not seem possible to attach any serious importance, for any purpose, to the remark, if made, even if anything said at the interview can be supposed to have had reference to a possible purchase by the defendants of the Kimball & Hadley business. Bayley was in a sanitarium, unable to testify, at the trial. Further testimony from Hadley, however, that certain factories had refused needles offered them by him for fear of controversy with the United Company was contradicted by the managers he mentioned. The business of Kimball & Hadley was one of those acquired by the United Company, but it was not acquired until the following June. It consisted in making Goodyear needles, which at the time of the acquisition the United Company was not making at all. An attempt by Kimball & Hadley, in litigation with the United Company some time afterward, to prove that threats and intimidation had been used in acquiring their business wholly failed. (See United Co. v. Kimball, 193 Mass., 351.)

Mr. Hurd is charged, in the testimony of Harry E. Cilley, with having said to him in 1901, during a conference with respect to a possible sale of his business to the United Company: "You can't do any business except on our sufferance, and you can't get a new dollar for an old one." It appears that Cilley's business at the time consisted in building a sole-leveling machine; that he was not satisfied with an amount suggested by Mr. Hurd as a proper price for it, told Mr. Hurd he considered it "outrageous," and never renewed
1484 the negotiations. Neither the business of this witness nor the

remarks testified to, if made, can fairly be regarded as of any serious importance, in view of all the circumstances shown.

It thus seems clear that nothing proved as to the above instances of so-called "threats and intimidations" is sufficient to justify such allegations as are made in paragraph VI of the petition about them. Even if anything said by a representative of the United Company on these occasions can properly be called a "threat," in view of all the surrounding circumstances shown, there is certainly no adequate reason established for believing that any competitor's customers have been induced to abandon them, or that anybody has been prevented from attempting competition by what was said. The instances relied on are widely separate in time and distinct as to circumstances and persons. They can not reasonably be regarded as showing a concerted purpose to suppress competition through intimidation, such as paragraph VI purports to charge. In every instance the expressions said to have been used by a representative of the United Company were in interviews with persons interested in some concern or machine which the United Company was asked or might be asked to buy. As has appeared, propositions of this kind were constantly being made to its representatives, and many more of them were refused than were accepted.

Not in paragraph VI, but in the preceding paragraph V of the petition, the charge is made that certain provisions of the leases, under which the United Company's machines have been operated by users, have been arbitrarily enforced, in pursuance of a general policy and practice to refuse machines for failure to comply with the terms and spirit of the leases "and to otherwise injure" users so failing to comply.

In the above bill of particulars filed, as has been said, on June 25, 1913, "in amplification of Section VI of the petition," the defendants are charged, in a number of specified instances, with threatening to remove or removing machines from the factories of users because competing machines or machines obtained from other concerns were also being there used or because such use of other machines was in contemplation. No proof whatever has been offered as to a considerable proportion of the instances thus specified.

1485 In the instances specified regarding which there is some proof nothing more is shown than that the United Company insisted, to a greater or less extent, upon observance by the lessee of provisions in his lease to which he had expressly agreed when he took the machine, and which he was purposely violating or proposing to violate to the detriment of the lessor, because such violation would tend to decrease the number of pairs of shoes operated on by the machine and thus the royalty to be paid for its use by the lessee.

If the provisions referred to in the leases are contrary to law, it was unlawful to insist upon them. The question here involved is later considered. But unless the provisions were unlawful, the evidence regarding these specified instances in which their observance was insisted upon wholly fails to show that in any instance the defendants did or attempted anything whereof either the lessee of the machine or anyone else had any right to complain.

It may be said generally that the instances in which machines were in fact removed from the factories of lessees under the provisions referred to have been so few in proportion to the total number of leases as to leave the general charge that such provisions have been arbitrarily or oppressively enforced destitute of any sufficient foundation. Only five such cases appear in the evidence. In each the lessee's conduct was in wilful disregard of the lease agreements and afforded a complete justification for the lessor's action, unless none is possible.

The bill of particulars filed June 25, 1913, brought into the case for the first time allegations that the defendants have endeavored to organize strikes in factories of shoe manufacturers wherein shoe machinery competing with their own was operated.

The only specifications under this charge are, in substance, that in June, 1910, Willson, then general manager of the United Company, assured certain employees of the Thomas G. Plant Company that if they would organize a strike in that factory the United Company would pay all expenses and reward the leaders "handsomely"; that in reliance upon said assurance about 300 of the operatives were brought into such an organization and a large sum
1486 of money expended by the organizers; that Plant thereupon had the organizers watched, and no strike resulted.

The only evidence to show that Willson ever gave any such directions or assurances came from three witnesses, employees at the Plant factory in June and July, 1910, who gave their testimony in person before the court. No one else was present, according to their statements, at the various interviews they described between Willson and themselves during the two months just referred to. Willson having died in 1911, and before these charges were made, no direct contradiction was possible of their statements as to what was said by him to them.

He told them, according to their testimony, that if they would organize a strike at the factory and give him all the information they could about the Plant machines he would pay their expenses, get them jobs, and pay them also $2,000 in cash (according to two of them)—$1,000 (according to the other).

Willson never did pay them any money, as they all agreed. But their testimony was that they got about 300 men into an organization

and spent about $1,500 of their own money in doing so, mainly in entertaining the men who joined. According to their further statements, $600 was contributed by one of them, $500 by another, and $400 by a third; their wages at the time were $15 per week; these sums were the savings of eleven or twelve years; accounts, lists, and vouchers containing details of their doings and expenditures were kept, but all of these were either surrendered to Willson or destroyed by them. No written evidence of any kind was offered in support of their story.

It appeared that there was some prospect of trouble between Plant and the employees at the factory at the beginning of June, 1910, but after meeting a committee with regard to an increase of pay asked for, Plant granted it, and no strike or other trouble ever occurred. There was no proof whatever that he ever employed detectives to watch the three witnesses in question, or that any attempt by them at organizing a strike ever came to his knowledge.

The testimony of these three men was not corroborated by any others of the then employees at the factory. On the contrary,
1487 several of them, shown to have had ample opportunity for knowing the facts had there been any such organization attempted as testified to, denied any knowledge of such organization or of any such preparation for a strike.

Winslow, president of the United Company, testified that Willson had told him, in June, 1910, that three Armenians had been to him asking that he furnish them with money to start a strike in the Plant factory, and that his instructions to Willson thereupon were to have nothing to do with them. No money of the United Company was ever paid out for any such purpose.

Not only does the evidence of these three witnesses appear unworthy of belief in view of its improbability, its lack of corroboration, and the evidence tending to discredit it, but it is difficult to understand how the petitioner could seriously have expected the court to accept such testimony, or have considered itself justified in offering it.

The history of the proceedings in this case indicates that efforts which may fairly be described as extraordinary have been made to bring before the court, so far as possible, all sayings or doings of any of the numerous defendants or their representatives, during the period beginning with 1899 and ending with 1911, which might afford ground for charging them with oppressive, coercive, or like unfair conduct toward competitors of the United Company or the public. In view of the long period and wide fields thus searched, the numerous abandoned attempts to prove something of the kind above indicated, and the insignificant result of the evidence actually offered and finally relied on, the conclusion seems fully justified that

the policy and methods pursued by the defendants and by the United Company have been, in general, above reproach in any of these respects.

7. It remains to consider the charges made in the petition as to certain provisions in the leases and license agreements, under which the United Company permits the use of its patented machines, that they are either unlawful in themselves or have been devised,
1488 adopted, and used by the defendants for the purpose of destroying competition. (Paragraph V.) Upon these charges the petitioner may be said to have finally put its main reliance.

With regard to the provisions in question, as with regard to many of the matters heretofore considered, the position finally taken by the petitioner has differed widely from that originally taken in the petition as filed.

None of the constituent companies were in 1899 selling outright the patented machines they manufactured. The bill alleges the contrary, and charges that one of the steps taken after 1899, in pursuance of the alleged scheme to restrain or monopolize, was to discontinue sales and compel leases. An attempt to support this charge by evidence wholly failed. Nothing of the kind was done, nor is it easy to see what grounds for making the charge could ever have been supposed to exist.

It appeared, on the contrary, that the method of marketing their patented machines followed by the constituent companies in and before 1899 was exclusively that of leasing, for a royalty upon each pair of shoes whereon the lessee should use the machine. Some of the leases also required an initial payment; others did not. The evidence also shows that the general system of leasing in this manner was, and had long been, the usual and accepted method of dealing between the makers of patented shoe machinery and those desiring to use their machines, and that, in its main features, it had thus become so widely and firmly established as to render the substitution of a different system practically impossible.

The defendants continued the policy which they found in use by the constitutent companies as to the kinds of machines to which this case now relates. Its machines of these kinds have never been sold outright; all users have taken them from the United Company upon leases granting the right to use the patented improvements embodied in them during the term of the lease.

It should be stated here, however, that as its business has progressed the United Company has developed a very large number of machines of other kinds useful in shoe manufacturing, as to which the policy of leasing only has not been followed. Such machines, included in what is known as the company's "General

1489 Department," have been and are sold outright to anybody willing to buy them, without restriction of any kind—a course of business more liberal than that pursued by either component company. The number of different machines wherein the United Company deals in the manner stated has come to be very considerable.

There was finally no contention that any law has been violated merely by the company's continuance of the policy of leasing only instead of selling.

That there was any violation of law in continuing, as the United Company did for a time after 1899, to maintain the leasing system and use the forms of leases which they found in use by the constituent companies, the petitioner is not in a position to contend.

There were suggestions in argument on its behalf that the system referred to was unlawful in some of its features, but the petition contains no such allegations. The claims therein made relate wholly to the leases put into use by the United Company after 1899 and rest on the proposition that these contain provisions "not found in (the) former lease and license agreements," the new provisions complained of being immediately thereafter specifically described. The petition characterizes them as "arbitrary, oppressive, and unreasonable." (Paragraph V.)

The United Company, of course, became after its formation the sole lessor of all the patented machines formerly leased by the different component companies. During the twelve years which then followed before this petition was filed there were, as is not denied, changes from time to time in the lease forms used for leases under which the use of certain of its machines were permitted. Generally speaking, one form was used with all leases of the same machine. There were some machines which might be taken under either of two alternative forms.

According to other allegations in the petition, it was part of the defendants' unlawful project, at the time of their combination in 1899, to refuse to sell or lease any essential machine except on condition that the lessee buy or lease of them practically all other machinery necessary or useful to him as a manufacturer of shoes.

No proof was offered at any stage of the case that the defend-
1490 ants had in mind in 1899 the system of leases they later developed or any of the modifications therein involved of the system which they found established in 1899.

At the argument the admission was made on behalf of the United States that there was no proof that at the time they formed the United Company the defendants "had in mind the adoption of the system of leasing which they later developed." And the position then taken by the petitioner in argument was that the leasing system referred to has resulted in illegal restraint or monopoly and that

the intent which prompted its development is therefore "absolutely immaterial."

As to the allegation that the defendants contemplated a policy of refusal to lease except on condition that the lessee buy or lease of them "practically all other machinery of whatever kind necessary or useful" to him as a manufacturer of shoes, it requires no further notice, now that the charge of restraint or monopoly in "any and all kinds of shoe machinery" has been abandoned. The evidence abundantly shows that nothing of this kind was ever contemplated, attempted, or done, and that there was never any justification for the charge as made.

With regard to the modifications introduced by the defendants upon the leases in use by the constituent companies in 1899, the petition alleges, in substance, (1) that under the former system lessees from one company were not held to the exclusive use of machines manufactured by any of the others; (2) that since 1899 the defendants have required their lessees, by provisions not found in the leases previously used—

"to agree to use exclusively one or more of the classes of machines included in said group of machines owned and controlled by them, upon penalty of having all the machines included in said group so leased to them by defendants immediately reclaimed and taken away and the lease and license agreement cancelled";

(3) that lessees are now obliged to hire each machine for a period of not less than seventeen years; (4) that lessees are now compelled to obtain all duplicate or repairs, parts, extras, etc., from the
1491 defendants at exorbitant prices; (5) also to pay return charges at the expiration of the lease, sometimes amounting to the original cost of building; (6) that the defendants now reserve to themselves in each lease the right to terminate all existing leases between themselves and the lessee upon his failure to use exclusively and to full capacity any machine leased to him by defendants. (Paragraph V.)

The evidence failed to show that lessees from the United Company had ever been compelled to pay exorbitant charges for repair parts, etc., or to pay any unreasonable return charges on leased machines. (4) and (5) of the above alleged modifications may therefore be now disregarded. In the subsequent sections of the petition no further reference to them is found.

In the "conclusion" section of the petition the following only, among the provisions thus alleged to have been added to the leases by the defendants after 1899, are charged to have been unlawful: Agreements by the lessee (1) that he would use exclusively machines of the lessor to perform the same kind of work as that performed by the machines leased, (2) that he would use in work

other than that for which the leased machine was designed only machines of the lessor, (3) that if the lessee should violate either of said agreements, he would forfeit the use not only of the leased machine, but others, whether accomplishing the same or different work, (4) that he should use the machine leased for seventeen years.

The objections made by the petitioner, at the argument, to agreements contained in the United Company's leases were not confined to those specified in the petition as above, but included others nowhere therein referred to.

At the argument, certain clauses extracted from the leases shown to have been used by the United Company, were said to embody the agreements objected to as unlawful.

But what was referred to as the "full capacity" clause, lessees agreed to use the machine to its full capacity on all shoes, etc., made by them in the manufacture whereof such machinery was capable of use.

By what was referred to as the "additional machinery"
1492 clause, lessees agreed that for any more work than their then leased machines could do, of the kind which machines belonging to the same department could perform, they would lease enough others to perform it from the lessor.

To neither of these two clauses was any reference made in the petition itself, as appears from the above summary of provisions in the leases therein complained of. The other clauses referred to at the argument were the following:

By what was referred to as the "exclusive use" clause, lessees agreed that if they should cease to use exclusively machines leased from the United Company, for doing work of the same kind upon shoes, etc., made by them, the lessor might, at its option, terminate all their leases of its machinery for doing work of that kind.

By what was referred to as the "prohibitive" or "tying" clause, lessees agreed that the leased machine should not be used upon shoes, etc., whereon certain other specified operations had been performed by machines not leased from the United Company.

By what was referred to as the "right to terminate all leases" clause, lessees agreed that failure on their part to observe any condition either of the lease of the particular machine or of any other lease from the United Company then in force, should give the lessor the right to terminate all leases of its machinery then held by them.

The above three clauses, and the alleged agreements requiring lessees to use the leased machine for seventeen years, appear to be the only provisions among those commented on in argument to which objection was made in the petition itself.

As to the use of such agreements as are expressed in the "full capacity" clause or the "additional machinery" clause, whereof, as has been stated, no complaint is found in the petition, the evidence shows that they were not new introductions by the United Company, but were contained in certain of the leases used by the component companies before 1899.

By neither was any agreement made which the evidence has shown to have been abnormal or unusual, or to have exceeded
1493 what was reasonably necessary to protect the lessor's interests in the contemplated use of its machine.

The lessor might well accept for the use of its machine a smaller royalty per pair, based upon the understanding that the machine would turn out as many pairs as its capacity permitted, than it could afford to accept without any such assurance.

Similar considerations apply to the "Additional machinery" clause. Without it, the lessee would be at liberty to do his slowest and most difficult work on the leased machine and the easiest on others or by hand.

The petitioner indeed conceded that both the above clauses might be unobjectionable had they not been used together with the others; but it relied upon their use with the others as tending to show the existence of an unlawful scheme. That this is an afterthought only, is shown by the failure to set forth either clause, in that aspect, in the petition. Moreover, as to the "Additional machinery" clause, the defendant had discontinued its use altogether two years before the petition was filed, a fact inconsistent with any claim either that it assisted monopoly or was intended to do so.

The consideration of the remaining clauses raises, in the first place, the question as to the truth of the allegations in the petition that such provisions were not found in the leases used before the consolidation of 1899, but were modifications thereafter introduced by the defendants, in pursuance of their alleged intent to monopolize the business.

The following facts appear regarding the leases in use by the component companies before 1899:

In the case of the more important machines an initial payment, of greater or less amount, was required of the lessee in addition to the royalty per pair stipulated in the lease. Such initial payments were required by all the leases from the Goodyear Company. The Consolidated & McKay Lasting Company required such an initial payment in leases of two out of the five patented lasting machines wherein it dealt; in its leases of two others no initial payment was required; and its remaining machine was leased either with or without initial payment at the lessee's option, the royalty being
1494 higher in the latter case than in the former. The McKay Com-

pany was the only one of the component companies whose leases did not require initial payments, whether those of the patented heeling or metallic fastening machines, which it made—or those of the Davey pegging machines, which it controlled.

It may be further stated with regard to the leases made by the constituent companies that two or more machines of the same company, intended for use in substantially the same operation, were generally leased as a group. Thus, Goodyear Company leases required its welter and out-sole stitcher to be used together, and permitted the auxiliary machines intended for use therewith to be used only on shoes welted and stitched thereon. As to its Ideal laster, the use thereof on welt shoes was restricted to use with its welter and stitcher. The leases of this company did not provide that the lessee should use its machines exclusively, and that unless so used the lease should terminate; but there were such provisions in the leases of the other companies. The Lasting Company's leases required use to the full capacity and the taking of additional machines for any additional work.

All the above leases were for terms for the most part either indefinite, or until cancellation by the lessor, or for the life of the patents embodied in the machines, or for seventeen years and thereafter during the life of any patent embodied.

In the forms of leases or license agreements which they found in use as above, the defendants made no change whatever until about a year had elapsed since the formation of the United Company. This the evidence shows without contradiction, and it further shows that when there were substitutions of new forms of leases in place of any of those in use as above, there was no change made all at once or in pursuance of any general plan, still less of any arbitrary plan; but, on the contrary, the change in each case was because special circumstances affecting the particular group of machines had come to render such change desirable.

The history of the successive changes adopted and of the reasons for each, was fully brought out in the evidence. Beginning with the first new lease form, adopted in March, 1900, the adoption of
1495 others followed at various times during the subsequent years. Some of the provisions most objected to by the petitioner were not adopted until 1904 or 1905.

Regarding the various modifications so introduced, it may be said in general that they tended to relax previous restrictions upon the use of leased machines, and to reduce the cost to the lessee of installing them. The most important changes made were, in substance, as below.

For agreements whereby the lessee expressly promised exclusive use of the lessor's machines belonging to the same group with that

leased, there were substituted options to cancel, reserved to the lessor, in case the lessee should discontinue such exclusive use.

The requirements found in leases used by some of the component companies that the leased machine should be used to its full capacity were extended to apply, in general, to all such machines, of the classes involved in this case, as were used in factories to measure the amount of work done, and thereby fix the amount of royalties to be paid upon the machines used in doing it.

As to certain groups of machines, provisions were introduced restricting the lessee's use of all machines belonging to the group to use only on shoes operated on by one or more of the other groups of United Company machinery. But in all such cases, without substantial exception, there was also offered an alternative lease form not containing such restrictions. An initial payment was required from all lessees preferring the latter form; no such initial payment was required from lessees under the form first mentioned.

A uniform term of seventeen years was adopted for all the leases.

Considering the clauses objected to in the light of what preceded them, and of the circumstances attending their adoption by the defendants, the petitioner has not, in my opinion, proved that the defendants' object in adopting them was the prevention of competition by others. Such prevention might, indeed, follow from the more favorable terms offered lessees, but modifications made in the existing system for the direct purpose of otherwise better
1496 adapting it to exclude competitors, would have been different in character from the modifications represented by these clauses.

Not only would it have been unreasonable, as has been said, to expect the defendants to substitute a wholly different system from the leasing system which they found in use, but the evidence affords no reason to believe that anything of the kind was desired by manufacturers in general. The advantages to them of not having to tie up capital in patented machines, and of paying for the privilege of their use only according to the amount of use, were advantages which they can not be supposed desirous of surrendering.

Modifications in the contracts offered them tending, as these are shown to have done, to enable the company, through provisions adapted to increase the number of shoes worked on by each machine, to lessen the royalty charged per pair, and to diminish or dispense with the initial payment before required, were so obviously prompted by the purpose of developing the company's business through the perfectly legitimate method of offering them on terms more advantageous to users, that it would be unjust to treat them, on evidence no stronger than that here presented, as really intended to accomplish an arbitrary exclusion of users from any dealings with others.

If it were made to appear that the leases containing these clauses accomplished in and of themselves an unlawful restraint of trade, or necessarily secured to the defendants an unlawful monopoly, the intent to accomplish these results would, of course, be imputed to the defendants without regard to their actual purpose in adopting and using them. But the evidence seems to me insufficient for the conclusion that such results are so accomplished. The contention that they are fails, in my opinion, to take into account the defendants' rights in the field lawfully secured to them in the various patented improvements they had lawfully controlled and combined; and fails also to concede them proper scope for the rights properly incidental to their control of said improvements, to make such agreements with their lessees as would best promote the efficiency in
1497 combined operation of the machines leased, and thereby best enhance and safeguard their just return therefrom in the form of royalties.

The complaints made regarding leases embodying the clauses referred to are not directed against those pertaining to any particular kind or kinds of machines, as more objectionable than others. It is their entire combined effect which is attacked.

Concurring as I do in the views expressed regarding them by Judge Brown, I am obliged to regard the petitioners' allegations of their illegality as not sustained by the evidence.

In my opinion the bill should be dismissed.

1499 District Court of the United States, District of Massachusetts.

THE UNITED STATES OF AMERICA
v.
UNITED SHOE MACHINERY COMPANY, OF New Jersey, and Others. | In Equity, No. 301.

[March 18, 1915.]

BROWN, J.: The United States charges that certain provisions in the lease and license agreements of the United Shoe Machinery Company with shoe manufacturers restrain interstate commerce and tend to create or perpetuate a monopoly of interstate commerce in shoe machinery.

We may examine this topic, which comprehends a large number of very long and elaborate documents and a very large portion of the briefs and arguments on each side, most conveniently by considering the effects which the United States claims result from such provisions, rather than by attempting to set forth in full the provisions themselves.

Complaint is made of the effect of such provisions:

I. Upon the shoe manufacturers.

II. Upon other manufacturers of shoe machinery.

The rights of these two classes and the effect of the leases upon each present quite distinct questions. The only competitors or possible competitors are other manufacturers of shoe machinery. The shoe manufacturers as such are not competitors. As the com-
plaints of the United States on behalf of the shoe manufac-
1500 turers and on behalf of other machinery manufacturers relate
to distinct matters, they should not be taken cumulatively, and should not be confused.

The effect of the leases upon the shoe manufacturers.

This may be considered in three aspects:

As bearing upon the question of the legality of the original combination or organization of the United Shoe Machinery Company;

As an alleged illegal and oppressive outgrowth of power obtained by combination;

As restricting the shoe manufacturer's freedom of choice in taking the machines of other manufacturers; as preventing him from using the machines of others; and as compelling him to use the machinery of the defendants.

The petition of the United States charges that the defendants—"conceived the idea of acquiring the ownership or control of all concerns engaged in manufacturing and dealing in any and all kinds of shoe machinery, and then to refuse to sell or lease any of the essential machines to the manufacturer of shoes except on condition that he buy or lease of them practically all other machinery of whatever kind necessary or useful to such manufacturer of shoes, and thereby to exclude all competition by other manufacturers of such shoe machinery and to monopolize the trade and commerce therein among the States and with foreign countries."

It is also alleged that certain lease and license agreements constitute steps in carrying out such project.

It is urged in effect that such plan comprehends a denial to shoe manufacturers of such opportunities to obtain machinery as existed before the consolidation, and a compulsion upon them, if they desire a special kind of machinery, to take also other machines of different kinds from the defendants.

There seems to be in the case no other basis for such allegations than the leases themselves.

This bill was filed December 12, 1911, before the decision in
United States v. Winslow, 227 U. S., 202. In that case the
1501 argument of the United States as to the so-called "tying

clause lease" shows a conception of the character and effect of the leases similar to that set forth in the bill of complaint in the present case. It was supposed that the effect of such leases was to compel customers to take all of their machines from the defendants, or all from other sources, and that this was a direct restraint upon competition and trade by depriving them of the existing right to use some machines without also using others.

The argument as to the effect of the leases both in United States v. Winslow and in the present case seems to be based rather upon an ingenious theory of bringing the defendants within the Sherman Act than upon any proper interpretation of the leases or accurate information as to the facts.

The union of noncompeting businesses in a single company would appear to have no tendency in itself to suppress competition. The union in a single company of distinct companies dealing in distinct patented inventions for performing different operations would seem remote from the sphere of the Sherman Act. To charge defendants, who were engaged in the manufacture and sale of patented machinery, with an attempt to monopolize had little plausibility in the face of the fact that grants of monopoly had been made by the United States.

The alleged plan of a refusal of what before could be had separately, as a means of compelling the taking of other machines, was a principal ground for invoking the Sherman Act.

The leases in evidence, as documents, fail to substantiate the charges either as to the contrivance of such a plan or as to its execution. It appears that after the consolidation there was no refusal or imposition of conditions as alleged, but that the defendants continued to give manufacturers terms which were substantially the same as before and in some instances better than those offered by the constituent companies before the consolidation. This is shown not only by the exhibits of "independent" leases but by the testimony of officers of the company.

The charge seems to have been based upon certain so-called "tying clauses." There has been some confusion as to the scope
1502 of the term "tying clauses." The United States gives the following definition:

"'Tied to' means that machinery can not be used in the manufacture of boots and shoes with machinery other than that owned and controlled by defendants."

This seems to require consideration of clauses of two kinds—(a) the "exclusive-use" clause; (b) the "prohibitive" clause.

The "exclusive use" clause reserves to the lessor a right to cancel the lease in case the lessee shall fail or cease to use exclusively machinery of the kind leased. This kind of tying has no direct bearing

upon the question of the legality of the combination. What was before separate is separate after the consolidation.

The "prohibitive" clause provides that the leased machinery shall not be used in the manufacture of shoes that have been or are to be operated upon by machines of certain specific kinds not leased from the lessor. Though a similar clause was in use before the consolidation, it related only to machines of the kind made by one of the constituent companies. After the consolidation it related also to machines of other kinds formerly made by other of the constituent companies.

The prohibitive clause, therefore, is the one that has relation to the supposed scheme of using the power acquired by combination to refuse machines that before were separately obtainable, and to offer such machines only on condition that other machines of different kinds should also be taken.

"Tying," therefore, does not mean that the manufacturer is required to agree, or agrees, not to use the machines of others, but merely that he has secured only limited rights of use, and that if he exceeds such limited rights he may lose his lease. It is not a question of the legal effect of the lease, but of the practical consequences of securing only restricted rights of use. The term is misleading in its implication that the manufacturer is bound by contract not to use the machines of others. He is bound only not to use the leased machinery in violation of the terms of the lease.

1503 "Tying" is an inexact and equivocal term, which may refer merely to the machine or may mean either that the lessee is bound by contract or merely is under strong practical inducement.

The restricted or prohibitive leases do not in themselves as documents prove the denial of the right to procure, as before, independent leases for individual machines. As matter of fact, independent leases which did give the right to use the machines with machines of other kinds, made by other machinery manufacturers, were always procurable. This was the general rule, and if there were any exceptions they were, so far as appears, inconsiderable.

It is a result of the consolidation that the United Company offers more attractive contracts for a group of machines of different kinds than for machines of one kind only; but as it still offers the contract for machines of one kind on as good terms as before it is difficult to see how that is detrimental to the shoe manufacturers.

The charge of this supposed scheme to deprive former customers of the right to use some machines unless they would also use others seems to have originated either in the erroneous assumption that a prohibitive lease was the only kind procurable, and that the former customer had no choice, or in disregard of the fact that it was merely an alternative form of lease. As the leases prove no such plan,

whether of the extent alleged or of less extent, and as the evidence proves the exact contrary of what is charged, we think that the United Shoe Machinery Company is, upon the merits, entitled to a full clearance from this charge.

It was, however, urged upon final argument, despite the decision in United States v. Winslow, 227 U. S., 202, that because the union of distinct lines in a single hand put it within the power of the company to devise and carry out such a scheme, the combination had such potentiality of evil that it should be disintegrated. This argument extends beyond reasonable limits the import of certain expressions of the Supreme Court in cases where there was such combination of competitors as to eliminate competition. This was within the statute, though none of the evils resulting from destruction of competition might yet have ensued.

In this case the mere consolidation of noncompetitive busi-
1504 nesses did not suppress competition, nor deprive customers of rights previously given by the constituent companies, and has no necessary or probable tendency to develop such a scheme as is unjustly attributed to the defendants. There must be added to the combination, from which naturally no such results would flow, an entirely new scheme.

The defendants having completely answered the charge that they devised or carried out such a scheme, the rejoinder that they might have devised and carried it out if they saw fit is entirely too far-fetched to bring the defendants either within the terms or within the spirit of the Sherman Act. Not only is there a failure of proof of the existence of such a scheme or of such a practice, but there is strong evidence to the contrary; not only in express denial but in the undisputed fact that the defendants' Goodyear welter and stitcher have never been put out on leases that prevented their use with machines of other kinds obtained from other manufacturers. These are the most important of the defendants' machines and the center of its system; they are the principal royalty paying machines and are furnished with a recording appliance to determine the number of shoes operated upon. The denial of their unrestricted use would have best served the alleged purpose of forcing the use of other kinds of machinery. The fact is that after the consolidation, as before, these machines, which the complainant's expert testifies are the only essential machines, and which are essential only if a shoe manufacturer chooses to make the special kind of shoes for which they are specially adapted, rather than shoes of other kinds, were put out only upon leases which did not contain the prohibitive clause.

The validity of the combination, therefore, is in no wise affected by the subsequent use of the prohibitive clauses.

We may next consider whether the shoe manufacturer who has chosen to take a lease permitting only a restricted or limited use of a particular machine is in any way injuriously or improperly affected by the fact that the businesses which before were in separate hands are now in a single hand.

1505 It can not be denied, and is practically conceded by the United States, that the "prohibitive clause," which is said to have the practical effect of tying together machines of different departments, is a limitation of the use of patented machines. The licensee has no right beyond the express provisions of his license, but is not bound by contract to take a machine for the performance of any other operation. If he desires to use for certain other operations the machinery of other manufacturers, he is met by the fact that the lease he has chosen, because it has been offered upon better terms than an unrestricted lease, gives him no right to continue the use of the leased machine. This, of course, may constitute a strong practical inducement to take other machines for other operations from the defendants rather than from other manufacturers. This inducement will be as strong as his desire to retain his lease. This, then, becomes not a legal but a business proposition.

The shoe manufacturer may untie the leased machine by taking another form of lease which contains no restriction, but requires an initial payment—though the royalties are the same. The amount of the "initial payment," which is a defined sum of money, seems, therefore, to constitute both the inducement to choose the restricted lease and the deterrent from changing a lease once taken for an independent lease.

This reduces the matter to one of dollars and cents. The defendants charge more for a machine used with machines of other manufacturers than for machines used as a part of a defined group of defendants' machines. Had they not combined the different companies they would have no occasion to do so.

The attack of the United States upon the "tying clause" makes no distinction between new machines which originated with the defendants and those in existence before the consolidation. There is, moreover, no attempt to show that the cost of independent machines has in any respect been increased since the consolidation, and the evidence from the defendants is to the contrary. Nor has the United States made any attempt to show by evidence that the prices charged for independent or unrestricted leases are excessive, or such as to prevent the manufacturer from using them profitably.

1506 The necessity of meeting the defendants' showing that there is no substantial obstacle in the way of a manufacturer who may desire to equip different departments with machines taken both from the United Shoe Machinery Company and from

other manufacturers is recognized by the United States, and the brief states:

"The amount of the initial charge for installing machinery under the so-called independent lease, and the cost for changing from one form of lease to another is so excessive as to restrain the manufacturers from choosing the independent system and to coerce them into taking the restricted forms."

Under this heading the United States relies merely upon the difference in price between the independent lease and the restricted lease. This is fallacious and does not meet the point. If the prices for independent leases are reasonable prices, if the shoe manufacturer can obtain what he could before, and upon reasonable terms, the fact that he and others are offered better prices for prohibitive leases is, of course, immaterial.

It is very earnestly contended that by this clause a shoe manufacturer is "bound hand and foot," and "is obligated" to take other machinery from the defendants. But when we consider that he has voluntarily chosen the limited right to use, and has merely declined to pay the price for the unlimited right to use—that he has got all he was willing to pay for—it seems fair to say that the only restraint upon him is the fact that he can not make use of another's property without his consent, and that this consent will cost him money.

It might well be said upon the authority of Henry v. Dick Co., 224 U. S., 1, 35, that the patentee's right embraces the lesser right of permitting others to use upon such terms as the patentee chooses to prescribe; and that the reasonableness of the terms offered for unrestricted use is not open to inquiry. But surely, if the argument is made that there is coercion through an excessive price, such an argument can have no weight whatever for any purpose legal or ethical unless the fact that it is excessive affirmatively appears. From such evidence as is presented in this case as to the amount of initial charges upon independent leases we can draw no support for the charge of coercion through excessive charges.

1507 The United States contends that the fact that independent leases are also offered is immaterial and that the validity of the prohibitive lease must be determined upon its terms alone. But this contention is clearly wrong. The tying of which complaint is made is merely the practical effect of the shoe manufacturer's choice of a restricted rather than an independent lease. When he wishes to provide himself with machines for other departments, his choice of the machines of other manufacturers may result in displacing machines leased from the defendants. If, however, he may still obtain the defendants' machines by the payment of an initial charge, then the only restraint upon his free choice is the sum of money required

to retain such of the defendants' machines as he has already installed. When a factory is equipped in the first instance with defendants' machines adequate in number for all departments, the choice between independent and restricted leases is a question merely of the comparative cost of installation. After a special equipment is outgrown, and there arises a demand for other individual machines to supplement it, then the manufacturer may desire a partial equipment with other machines of other manufacturers. Here arises from the prohibitive clause the substantial obstacle above referred to—that the installation and use of such machines may result in the removal of the whole equipment which he has taken from the defendants.

But the situation is one that can result only from a direct violation of one or more of his leases. While this may seem a harsh consequence of a breach of contract or of an infringement of the defendants' patent rights, it can not be said to touch the question of the validity of the prohibitive clauses. Even should we regard the agreed consequences of a breach of contract as serious, this does not relieve us from deciding the question whether the contract in itself is valid.

As it is not the purpose of the defendants to take their machines out of factories, but rather to put them in, we must consider those clauses which are designed to induce their installation, rather than those clauses that are designed to prevent a breach of contract,
1508 or which reserve a right to terminate the leases upon an infringement of patent rights.

We may assume that the prohibitive leases with the reduced prices are adopted by the defendants as an inducement to the manufacturer to take also several different kinds of machines, and that having once taken a restricted lease the manufacturer remains under a strong inducement to take machines of other departments from the defendants, and not from other shoe-machinery manufacturers.

The United States contends that the patent laws confer upon the owner of a group of machines, each protected by a distinct patent, no right to handle the entire group as a unit, thus making one patented machine aid another.

It is true that the right granted to the patentee to exclude others from the use of his patented invention is confined to the subject matter of that invention. It does not include the right to exclude the use of any other machine, patented or unpatented. When, however, a patentee has installed in a factory several distinct machines, each upon a restricted lease, he has as to each a full right of exclusion from other than the licensed use, and thus may legally exclude all machines that compose the group. But the proposition that patented machines can not be handled as a group is stated too broadly.

If what was before in separate hands is grouped in a single hand, and handled only as a unit, this might result in a refusal of what before was obtainable. But if the patented machines are handled both as individual machines and as a group, so that there is a free choice between the taking of individual machines and a group, we see no ground for objection.

One patented machine may be made to aid another in two ways—by using a refusal to deal with them separately as a means of compelling the taking of both, or by offering both at a lower price than the sum of the separate prices for each. The first is the way charged in the petition, but disproved as matter of fact; the second is the common device of wholesaling instead of retailing.

Were the defendants exercising merely the ordinary rights
1509 of owners of property, it could not be said that an entire contract concerning a group of such machines was illegal.

It is conceivable, if a single person should assemble in his hands a large number of distinct patented articles previously upon the market and refuse to sell any unless all were taken, that this in special circumstances might constitute such obstruction to a former freedom of trade as to fall within the Sherman Act. Where the patented machines were originated and first put upon the market by the defendants it is difficult to find any reason why they should not be grouped; but where there is no obstruction to a former freedom of trade, where there is no refusal of any article upon the former terms, it can not be illegal to offer a group for a price which is lower than the sum of the separate prices, or—what is the same thing—to offer each article at a lower price if other articles also are taken at a lower price.

We are unable to see that a shoe manufacturer has any just cause of complaint that the defendants offer him and their other customers restricted leases. One who refuses these leases and takes the independent leases may complain that other shoe manufacturers are getting their machinery on lower terms; but the royalty rate will be the same, and the cost of initial payments is fixed and may be weighed as against the estimated value of taking machinery from other manufacturers. It is a mere question of dollars and cents. It is legal for the defendants to discriminate in price between customers who take large amounts and those who take small amounts. In fact, it appears that certain large manufacturers have contended that it was unjust to them to fix the same royalty for a large manufacturer as for a small one, which has been the practice of the United Company.

We conclude, then, although the prohibitive leases, in so far as they tend to group together machines of different departments, may be regarded as a direct outgrowth of the consolidation; that the consolidation was not for this reason in any way detrimental

to the shoe manufacturer, but, on the contrary, was for his benefit, since it enabled the United Company to offer him better terms and enabled him to equip his factory cheaper than before. The
1510 argument of the United States upon the tying of department to department shows no reason for invoking the Sherman Act in behalf of the shoe manufacturer.

The effect upon other manufacturers of shoe machinery is a distinct topic to be considered later.

The leases are also complained of as restricting the shoe manufacturer's freedom of choice in taking the machines of other manufacturers; as preventing him from using the machines of others, and as compelling him to use the machinery of the defendants.

We may for the present disregard the fact that the United Shoe Machinery Company was organized by combining distinct companies.

The "exclusive-use" clause relates only to machines of a particular kind or department, thus differing essentially from the prohibitive clause. It was in use before the consolidation, and after the consolidation was not changed in this respect. Though it does not relate to grouping what before was separate, this clause imposes a limitation upon the right to use machines of a particular kind. The legal effect of it is merely a reservation of a right to cancel the lease in case the lessee should fail or cease to use the defendants' machines exclusively for work of a particular kind. It does not have the legal effect of a contract by the lessee not to use the machines of others. It is merely a limitation imposed by a patentee upon the right to use.

The reiteration by the United States of the statement that the lessee must use, or is required to use, defendants' machines exclusively is misleading. The distinction between a contract requiring a lessee not to take other machines and a limitation of the right to use the leased machines is very material.

The supplemental brief of the United States contends: "There can be no defense under the patent laws as to any provision complained of in the leases unless it be as to the use of the prohibitive clause." But no distinction can be made in this respect between the exclusive-use clause and the prohibitive clause. Both are limitations imposed by a patentee upon the use of his invention. The exclusive-use clause is effective only when the lessee is oper-
1511 ating machines of other manufacturers for doing work of a kind for which defendants' machines are available.

Here, again, the right of a patentee to so limit the license would seem to be directly sustained by the statement in Henry v. Dick Co., 224 U. S., 1, 35, already referred to.

The United States complains that it is the policy of the defendants to say to a lessee that for doing work of a particular kind he must use all or none of its machines.

If the general insistence upon the exclusive use clause is evidence of refusal by the defendants to lease their machinery for use with the same kind of machinery taken from other manufacturers, yet this refusal precedes any contractual relation between the defendants and the licensees. At this time the parties are unquestionably free to contract or not to contract, and by refusing the terms offered the shoe manufacturer loses nothing which he had before. "The public is always free to take or refuse the patented article on the terms imposed." Henry v. Dick Co., 224 U. S., 1.

The United States replies that the shoe manufacturers are not free to take or refuse; "they have entered into contracts which constitute an endless chain with respect to the use of the United Company's machines."

It is in evidence that during the existence of the United Company many new factories have been established and new installations made for persons who have voluntarily accepted these terms. Can the shoe manufacturers be permitted to complain, or the United States upon their behalf to complain, of what has thus been agreed to? These agreements have been entered into voluntarily by parties assenting on terms of equality. Can it now be urged that the acceptance of a limited right shall be declared a sufficient ground for making the right unlimited? Being free to choose in the first instance, and having chosen, can a lessee now urge that he is not free to use the defendant's property as he pleases as a reason for dispensing with the necessity of procuring that right from the owner of the machinery which he has installed?

It is merely rhetorical to say that these contracts constitute an endless chain. We have seen that as to the prohibitive clause
1512 there is a mere question of price. As to the exclusive clause there is a mere question of choosing between two different sets of equipment for one operation. The recent decision of the Supreme Court in Coppage v. Kansas, January 25, 1915, should put an end in this case to any argument upon behalf of the shoe manufacturers which alleges compulsion or coercion, or which asserts a freedom to use the property of another without procuring from him the right to do so.

"For constitutional freedom of contract does not mean that a party is to be as free after making a contract as before; he is not free to break it without accountability. Freedom of contract, from the very nature of the thing, can be enjoyed only by being exercised; and each particular exercise of it involves making an agreement which, if fulfilled, prevents for the time any inconsistent course of conduct."

We must keep this in mind—that it is no part of the policy of the Sherman Act to relieve men of full age from the obligation of their

contracts, nor to interfere with contracts, except so far as they may restrain trade of contracting parties, or be aimed at the trade of third parties with a design to effect their exclusion from trade otherwise than by supplying a demand in fair and lawful competition. It could not be said that the trade of the shoe manufacturer was restrained by the denial to him in the first instance of the use of patented machinery, whether arbitrarily or by offering terms he could not accept. It would be equally unsound to say that his trade is restrained by a contract which provides for him at a very low price the most efficient machinery known at the time of the contract.

It is probably enough to say that, under the uniform rule recognized in many decisions, the defendants have the right, both as owners and as patentees, to refuse the use of the patented machines of any department as they may see fit, whether unreasonably or reasonably. However, as it seems to be contended that these rights have been impaired, to some extent, by the Sherman Act, we may consider whether or not the exclusive use clause is inserted for reasonable and proper purposes.

It can not be said that it is unreasonable or against public
1513 policy for the defendants to deal with shoe manufacturers only on the basis of a full equipment for a particular operation when the subject matter of the contract is not machines alone, but patented inventions as well. The inventions may reasonably be regarded as the principal subject matter of the contract rather than the number of machines necessary to a particular manufacturer. While the manufacturer may prefer to contract with reference to each machine as a unit, the defendants may prefer to regard the number of machines with which a manufacturer is to be furnished as incidental merely to a policy of licensing those only who will pay royalty according to the amount of work they have for machinery embodying the patented inventions. The amount of royalties to be paid by the manufacturer is, of course, a primary consideration.

While in the early stages of the case there were some criticisms of any leasing system as opposed to a system of selling, the very great advantages to shoe manufacturers in general of being provided with machine equipment of the highest efficiency, and of being relieved of individual effort in that most costly and difficult part of manufacturing, and the general satisfaction with the system were so overwhelmingly proved, that all doubt that the leasing system in general is unimpeachable has been removed. Furnishing capital to shoe manufacturers in the form of shoe machinery embodying costly inventions as well as great mechanical skill in manufacture, the defendants are fully entitled to claim a proper share of the advantages resulting from what they have produced. How to

obtain a just return for what they have contributed to the practical art has long been a problem with inventors. With many of them it has been a cause of complaint that a just share was denied them in what was attributable to their efforts. They have been accustomed, so far as they have been able, to reserve such rights as would secure to them a proper share in whatever business might be developed under the protection of patents covering their inventions.

In determining what is a reasonable share of profit when payment is to be made upon a royalty system, the value of the machinery as a means of production must, of course, be considered. A con-
1514 tract that a lessee should pay in advance a gross sum computed upon the capacity of the machine, or a rental computed upon the capacity of the machine alone, could not be criticised as unreasonable. A royalty system, however, in which payment is made only according to use is generally more acceptable.

If we are to consider such contract with regard to the rights of the lessor as well as to the rights and preferences of the lessee, it would be difficult to devise a more equitable arrangement than a requirement that the lessee should pay royalties according to the availability of the patented machinery for his use, rather than for such use of it as he may from time to time prefer to make. The lessor demands payment only so far as his machines are actually useful or available for the use of the lessee.

It is suggested in the brief of the United States that the lessor might accomplish all proper purposes by the fixing of a minimum amount of royalties; but such a suggestion does not solve the difficulty, for a minimum amount fixed in advance should include not only present use but such future use of the invention as might be developed. A royalty which has regard both to the capacity of the machines which the lessor furnishes and to the amount of work which the lessee may have to do upon machines embodying the patented inventions, seems beyond reasonable criticism. It is, of course, essential not only to fix a royalty rate but to provide a rate of use and a period of time for the use. A contract of this character must have permanency, and may be reasonably continued over a long period of years. A royalty may be likened to interest upon a principal.

A contract involving so largely the subject matter of inventions and of patent rights, and relating to the use of the tangible property of the defendants in the form of machinery and of intangible property in the form of patent rights, is substantially different from ordinary transactions of commerce, in that it relates so largely to the use merely of property, the title to which has not changed, and which continues for a long period in a fixed location, out of the path of interstate commerce. Browning v. Waycross, 233 U. S., 16.

Where the annual use is small it would seem necessary that the
1515 period be protracted, in order to secure a fair return upon the investment. Where machinery is furnished which is of a capacity beyond the work which the lessee has to do, the efficiency of the machine, its great productivity, which is due to constant improvements, is not fully availed of; and it may be said that there is value lost owing to the limited business of such lessee. Where the product of a manufacturer is very large, and where the capacity of many machines is availed of, the manufacturer may think that the important thing is the gross amount which he is called upon to pay, and that there should be some reduction in the rate of royalty or in the amount of use required. On the other hand, it might well seem to the Shoe Machinery Company that if its equipment had proved especially valuable to a particular business it should receive its full share on a pro rata basis.

There would seem to be little chance for a difference of opinion upon the question whether a shoe manufacturer who had been furnished with machinery of greater capacity than he was able to avail himself of should diminish his return of royalties by the employment of the machinery of others. The presence and use of other machinery would in such case be so directly inconsistent with the reasonable requirement that he should pay royalties to the extent of the use for which the leased machine was available, and use the machine to its full capacity so far as he had work for it, that the use of other than the leased machinery should be a sufficient cause for termination of the lease. It is said to be the case with a very large number—perhaps the majority in number—of shoe manufacturers that the machine equipment furnished them is more than sufficient for their work. The exclusive use clause, therefore, seems a necessary provision in these cases for securing what, from any point of view, must be regarded merely as reasonable compensation to the lessor.

With the large manufacturer the question is somewhat different. There will still exist the practical difficulty, if he introduces the machines of others, of determining what shoes are operated upon by such machinery and what by the defendants' machinery; but is
there reason for denying to the defendants the right to invoke
1516 the exclusive use clause merely as a means of securing to themselves their royalty upon the entire work of that kind done by the manufacturer?

Here, undoubtedly, is a chance for a decided difference of opinion between the large manufacturer and the Shoe Machinery Company as to what part of the business success should be attributed to the defendants' patented machinery and what to the business ability of the shoe manufacturer, and for decided difference of opinion as to whether the claim of the Shoe Machinery Company to a royalty

on all the work of a particular kind is reasonable. And here seems to be the only situation in which any question of the reasonable character of the exclusive use clause can arise. The terms, however, were fixed at the beginning, while both parties were free to contract or not. The machinery was installed with full notice that the lessee's right to its continued use was subject to the right of the Shoe Machinery Company to insist upon having royalties for all the work or to remove its machines if the lessee refused, as he has the right to do, to continue on that basis.

There is here no question of restraint of the trade of the shoe manufacturer, and no question whether a restraint of trade is reasonable or unreasonable. The lessee has contracted away no right which, but for the contract, he might freely exercise. The defendants stand ready to supply the manufacturer with machinery for the profitable carrying on of his trade. The shoe manufacturer has a full right to choose, and if the exclusive use clause is invoked is free from all obligation under his lease.

Furthermore, a contract providing that a manufacturer's business be carried on with machinery entirely adequate for the conduct of his trade, and which is the best machinery known for the purpose, does not injuriously affect him or the public. The reasons which underly the rule of public policy that forbids contracts in restraint of trade are absent.

A contract, requiring the use of certain machinery in a manufacturing business, between one who is to carry it on and one who is to furnish capital, or his own property tangible or intangible as a means for carrying it on, is a provision " for the prosecution of
1517 the business in a particular mode and not for its restraint." See Kinsman v. Parkhurst, 18 How., 289, 293; Chicago v. Pullman, 139 U. S., 79, 89.

This can not be treated as a petition for the reformation of contracts made between the defendants and the shoe manufacturers. An appeal to the public policy evidenced by the antitrust act can not be made to extend the rights of the shoe manufacturers, under their contracts. There being no restraint of his trade, the United States shows no ground for intervention on behalf of the shoe manufacturer.

The "additional machinery clause," though not included in the Government's definition of a tying clause, requires a brief consideration.

This is a contract by the lessee that if he has work for more machines than were first installed he will take from the defendants such additional machinery of the same kind as is necessary for doing all his work of a particular kind. This was an old form of contract

in use before the consolidation, and to some extent afterwards, though abandoned some time before the filing of the petition.

The grounds upon which the exclusive use clause is held reasonable support this clause also. The exclusive use clause, however, represents the present policy of the company.

The "full capacity clause," by which the lessee agrees to use defendants' leased machinery to its full capacity so far as he has work for which it is capable of use, has already been referred to. The direct purpose of this is to secure a substantial amount of royalties. It is inconsistent with the use of the machines of others, but of this no just complaint can be made. Having a license for the use of patented inventions, the lessee must pay the agreed consideration, and if the licensor insists he must pay it whether he in fact uses the machinery or not.

The agreement to use to full capacity is auxiliary to the purpose of fixing the gross amount of royalties. It relates to machines with a recording mechanism which shows the number of shoes operated upon. Upon a breach of the agreement to use to full
1518 capacity it is difficult to see that there could be any basis for damages other than the amount of royalties that would have been paid had the machines been so used. An alleged breach of a somewhat similar provision for determining a quantity upon which royalty was to be paid was held not to be an independent cause of action, the provision being merely a subordinate part of an agreement to pay royalties. Jobbins v. Kendall Mfg. Co., 196 Fed., 216; see also In re O'Gorman Co., 195 Fed., 650.

But the general impracticability of determining the amount due, except in the way contemplated, fully justifies the provision for a cancellation of the lease upon a discontinuance of the use of the machine and the production of the proper record.

The United States concedes that if the "full capacity clause" stood alone, thereby requiring the use of the leased machine alone as long as it could perform all work of that kind which the lessee had to do it would be subject to little criticism. The objection is to its use in conjunction with the "exclusive use" or "additional machinery" clause. This conjunction of clauses, it is said, inserted in a large number of leases, shows a policy to force or create in the defendants the power to force its lessees to use exclusively machines of that class. This it is asserted is unlawful.

But the mass of leases has, in this respect, no cumulative effect upon the shoe manufacturer, for each lease taken singly gives to the lessee notice that his right to use may be terminated if he fails or ceases to use exclusively. The question as to him is whether such a reservation of right made by the lessor of patented machinery is unlawful.

If there is any "force" exerted upon him, it is from his lease alone, and not from the mass of leases taken by others; and, as we have seen, is merely the result of a limited grant made by a patentee, who may refuse him any right of use. But here, as we have seen, is nothing that can justly be deemed coercion.

Complaint is also made in behalf of the shoe manufacturer that the term of the licenses is too long—seventeen years—and it is said that this period is regardless of the terms of the patents.

Allegations were made that these long terms were fixed for
1519 the purpose of tying up by contract what would soon be free from control through letters patent. It is true that the United States referred to certain licenses which ran beyond the terms of any patents mentioned in them. The evidence shows, however, that the leased machines were, as matter of fact, protected by letters patent throughout the period of the leases. Seventeen years, of course, is the term of a patent. Nothing is more common in agreements concerning patented inventions than to contemplate and provide for improvements. The shoe manufacturers who have assented to this period can not complain of it. They have secured very valuable rights at a very reasonable sum for a long period of years. The history of the company and the experience of the manufacturers, who have not been required to sink their capital in machinery which, as the evidence shows, will afford them no banking credit, shows no just cause for complaint as to the length of the contracts. The evidence shows that full value has been furnished by the defendants for the royalties which they have received.

In considering the reasonableness, as between the defendant company and the shoe manufacturer, of a long-term contract, we must look not alone to the fact that the shoe manufacturer may be bound for a long term. It is a case of reciprocal obligation, for the shoe manufacturer is bound for no longer period than that for which the defendants, upon a just construction of the lease contracts, are also bound. The requirement of use to full capacity, so far as the manufacturer has work, and the exclusive use or additional machinery clause impose upon the defendants the corresponding duty to furnish machines, and the shoe manufacturer is relieved from his obligation unless the defendants supply him with the means for fulfilling it.

It has been suggested that the terms of these contracts may be indefinitely prolonged by furnishing additional machines only for new periods of seventeen years. Apparently there is no force in this suggestion; for a failure of the defendants to furnish what was necessary for carrying out the requirements of the contract, or the refusal to do so except on terms inconsistent with the original contract, would release the lessee from his obligation.

1520 The insistence of the defendants upon the taking at the outset of an amount of machinery adequate for a lessee's entire work is, as we have said, unquestionably within their right. When additional machinery is sought, and the defendants insist upon the same general terms, their right to do so can not be abridged by the fact that there has been a previous installation of machines. The policy is not altered from that of which the lessee was apprised at the outset.

The cancellation clauses, however, provide a practical means of escape for those who consider the term too long. They may install other machinery and run the chance, and if the machinery so installed is satisfactory they may use it for their full equipment when the machines of the defendants are removed.

It is contended for the defendants, and there is evidence in support of such contention, that the actual practice of the Shoe Machinery Company is not fairly represented by reference to the literal terms of the leases, but that it is much more liberal, and that it is customary to make modifications in particular cases.

The general policy of the company has been clearly brought to the attention of its lessees and was exercised fairly and reasonably in those specific instances which the United States has brought to our attention.

It is stated upon the brief of the United States that the record shows that a number of the largest shoe manufacturers in the United States, lessees of defendants, are dissatisfied with their system of leasing. A number of these gentlemen have testified before us as to their very large production of shoes. They made no claim that the leases of which they complain have not furnished them with machinery entirely adequate for their business. Though the argument of the United States has urged upon us the unfortunate position of a shoe manufacturer after he has entered into contract with the Shoe Machinery Company, and deplores his supposed obligation to use the defendant's machinery throughout the contract period, yet these very intelligent gentlemen can not be regarded as objects of unjust
1521 oppression or coercion, unless that term be used in the very loose sense which was rejected by the Supreme Court in the case of Coppage v. Kansas, January 25, 1915.

The hardship to a manufacturer if, during this long period, there should come upon the market superior machinery has also been urged. During the period of the leases no such situation has apparently arisen. This argument was very sensibly dismissed in the United Shoe Machinery Company v. Brunet, 1909 A. C., 330, as based upon too remote a contingency. Such contingency was within the purview of the parties at the time they entered into the con-

tract, and the choice of the restricted instead of the independent form of lease would seem to indicate that the practical value of being able to meet it was not considered by the shoe manufacturers greater than the amount of the initial premiums for independent machines. A business contract, like a statute, is not to be upset "upon hypothetical and unreal possibilities, if it would be good upon the facts as they are." Pullman v. Knott, 235 U. S., 23.

As has been said, the Sherman Act was not designed to relieve parties from the obligation of contracts fairly entered into. It can not be invoked in this case to abridge the right of contract in order to establish what Justice Holmes terms "the equality of position between the parties, in which the liberty of contract begins." Coppage v. Kansas, 236 U. S., 1. Here the parties stand upon terms of entire equality. The large shoe manufacturers and the defendants seem to differ as to what are fair and reasonable terms, but the Sherman Act can not be invoked to settle a trade dispute of this character between such parties.

To justify interposition in behalf of the public it must appear that the interests are those of the public generally, as distinguished from those of a particular class. The legislature may not, in the guise of protecting the public interests, arbitrarily interfere with private business. Lawton v. Steele, 152 U. S., 133, 137. The rules of public policy which make a given contract void are not to be extended arbitrarily. Baltimore & Ohio v. Voigt, 176 U. S., 498, 505.

There remains to consider upon this branch of the case, and as directly bearing upon the reasonableness of these contracts, the
1522 important fact that a very large number of very intelligent and competent men, heads of manufacturing establishments, have independently accepted these terms. The large number of leases is strong evidence that upon the whole the terms are reasonable, and that the requirements from the lessee, of which complaint is made, have not been regarded as more than could be advantageously accepted. Such manufacturers have had free option to manufacture boots and shoes of other kinds. They may have from the defendants by purchase if they like the assistance of some 170 machines from their general department. They may have manufactured for them, if they see fit, those commercially practicable welters and stitchers upon which patents have expired, or they may manufacture largely by hand methods. It must be remembered that the defendants' machines are largely labor-saving devices. The situation is not that of a monopoly, and the case of the United States upon that aspect has completely broken down. These contracts which the United States attacks, moreover, give to the lessees, many of whom seem entirely satisfied with them, very valuable rights.

Nothing more impractical can be imagined than the prayer of the petition that these contracts should be cancelled. To restore the parties to the original situation would probably result merely in agreements which would meet the objections of the United States, and would yet be in substance the same. Payment of royalties according to use necessarily involve some provision as to the amount of use. The exclusive use clause can only be criticised as requiring too much use, and, therefore, too high a price. It is, after all, a question of price, and the right of the defendants to fix their prices covers so many different modes that if this particular mode of payment is found objectionable, other modes less convenient, but accomplishing the same result, could readily be adopted.

The United States also objects to the fact that certain auxiliary machines for use in conjunction with the Goodyear welter and stitcher are supplied only to those who take the Goodyear welter and stitcher. These auxiliary machines are supplied without royalty,

1523 and for the purpose of increasing the production of the welter and stitcher; but there is no proof that the combination affected these. The right of a person to promote the sale or use of one class of goods by giving also other goods or tokens for goods, though it has been attacked by legislation, has been upheld in decisions which hold such legislation by a State unconstitutional. Van Deman & Lewis v. Rast, 214 Fed., 827, 833; Little v. Tanner, 208 Fed., 605, 610; State v. Dalton, 22 R. I., 77.

The rule that a decree can not be made which injuriously affects the rights of third parties would seem to require that before the court in any event could proceed to a decree to annul these leases the lessees should be before the court as parties. Minnesota v. Northern Securities Co., 184 U. S., 234, 235; Shield v. Barrow, 17 How., 130; Gregory v. Stetson, 133 U. S., 579.

The effect of the leases upon other manufacturers of shoe machinery.

Here we have to consider the effect of the mass of defendants' leases upon persons who are not parties to them, and who, therefore, have not entered into any contracts in alleged restraint of their trade. The inquiry must be, therefore, whether by reason of the insertion in a large number of leases of those clauses of which the United States complains competition is suppressed to such extent as to tend to monopoly of interstate commerce in a field which otherwise would be open to competition.

It is most important to observe that the petition presented the leasing system as a part merely of a general plan of monopoly. The main brief of the United States so treated it.

The subject matter to which these leases relate is a part only of the machinery dealt in by defendants. The supposed field of monopoly

has now shrunk so that it is much narrower than the general field of shoe machinery, or of shoe machinery for the bottoming of shoes by stitches or otherwise, in which field it appears that there never has been a monopoly, but always active competition between defendants' machines and other machines.

The supposed monopoly, or suppression of commerce, relates to machines for performing a part only of the large number of
1524 operations necessary to complete a shoe. The leases relate to machines protected by patents; many of them were originated and first put upon the market by the defendants. Many of these machines have such individuality that there are no others which perform the same function or with which they could be classed.

With articles of common production the existence of competitors may be assumed, but here no such assumption is admissible.

If the question here is whether the leases have the effect of unlawfully excluding competitors from interstate commerce in shoe machinery, we must at the outset inquire in a general way as to the present or possible existence of competitors. In United States v. Winslow it was said:

"The machines are patented; making them is a monopoly in any case; the exclusion of competitors from the use of them is of the very essence of the right conferred by the patents; Paper Bag Patent case, 210 U. S., 405, 429; and it may be assumed that the success of the several groups was due to their patents having been the best."

As the subject matter of the leases is patented machinery, the presumption is that there are no competitors who can offer the same machinery. Whether there are competitors able to supply other kinds of machinery, patented or unpatented, which can be used for work of the same general description as that for which defendants' patented machines are adapted and used is matter for conjecture.

The competitor who is excluded from supplying the defendants' lessees because the lessee is compelled to choose between his machines and the defendants' machines may be, and as to many of the machines is likely to be, an imaginary being.

It appears, however, that for some of the operations for which the leased machines are adapted there are upon the market machines made by other manufacturers, and that in a general sense there are competitors.

To determine how far the leases have had the actual effect of excluding competitors it would be necessary to consider in much detail the special subject matter of the leases, the dates of
1525 patents, and the special and peculiar operations performed by the machines.

The defendants insist that in order to meet a charge so much narrower than that of the petition it would be necessary for them

to offer evidence as to each unit, and to prepare a defense of an entirely different character from that required to meet the petition; and this seems probable. We may, however, refer to a few considerations of a general character.

In the first place we must make a clear distinction between that which undoubtedly the defendants have the right to do and that which it is said may improperly affect competitors.

As owners of patented machinery and as manufacturers of machinery, whether patented or unpatented, they have the right to supply to the best of their ability as many customers as can be induced to take their machinery. They have the right, for the reasons which we have stated, to enter into long term contracts with shoe manufacturers for the use of their patented machinery throughout the terms of the patents. Merely as manufacturers they have the right to enter into long term contracts for supplying their machine equipment to those who are willing to agree to long term contracts.

That, irrespective of the question of patents, a long-term contract, fifteen years, with exclusive rights, was not in general restraint of trade, and was not void as against public policy, was determined in Chicago etc. R. R. Co. v. Pullman Car Co., 139 U. S., 79, 89, et seq.

The United States relies greatly upon U. S. v. Reading Co., 226 U. S., 324, and seeks to establish an analogy between the so-called "sixty-five per cent contracts" in that case and the large number of contracts of the defendants with shoe manufacturers in this case. But the resemblance between the Reading case and the present case lies only in the fact that in each is a large number of contracts. In the Reading case an existing and definite supply of coal was monopolized, and a definite part of that supply was monopolized through the sixty-five per cent contracts. In this case, so far as the leases are concerned, there is no question of monopolizing an existing supply. The monopoly, if any, is a monopoly of
1526 customers for machines for performing the particular operations to which the leases relate. The complaint is that defendants' customers are so bound by the leases that they are no longer customers for other manufacturers of shoe machinery.

The monopolizing of a definite and limited supply of a commodity and the monopolizing of customers for machines for performing certain operations in the manufacture of shoes are as far apart as possible. The number of customers, or possible customers, for shoe machinery has been very largely increased during the life of the defendant company. Many of these customers were first induced to be customers for shoe machinery by the fact that machine equipments were offered them adequate for the establishment of a manufactory of shoes. The customers are not a fixed quantity.

They comprise such persons out of the entire population of the United States as may be induced to engage in a manufacturing business by knowledge that they can procure adequate machinery for that purpose on suitable terms.

We must take into consideration not only natural persons but also those artificial persons easily created under general laws of incorporation for the conduct of any enterprise requiring a considerable amount of capital. A large number of shoe manufacturers concerning whom there is evidence in this case are corporations, and the leases relate to the activities of corporations. The individuals who are stockholders or officers of such corporations may in new corporate forms engage in shoe manufacture.

Upon the face of it any undertaking to monopolize such an undefined field as that of customers for shoe machinery seems impracticable.

Counsel for the United States inquire what possible hope there is for other manufacturers to deal with the customers of the Shoe Machinery Company so long as their leasing contracts prevail. This inquiry would be substantially the same if all those provisions in the leases to which objection is made were stricken out.

Assume the existence of a large body of leases for only the period of patents and requiring merely payment for a right to use, but with the additional machinery clause, the exclusive use clause,
1527 and the prohibitive clause omitted; the inquiry would still be the same. It may be said, however, that with these clauses in it is somewhat more difficult to deal with a customer who has secured from defendants either a complete or partial equipment.

The exclusion from trade which results from the fact that many customers are supplied cannot be complained of by the United States. The complaint must be limited to such exclusion as results from the clauses objected to.

Perhaps the simplest way of treating the leases in this connection is to consider whether if the defendants had agreed in express terms to furnish for seventeen years entire equipments for shoe factories, and the shoe manufacturers had agreed to operate these equipments exclusively for that period, this could be condemned.

The true effect of the leases is much less than this, but if such agreements can be condemned it must be upon the theory that both the defendants and the shoe manufacturers have lost the freedom of contract which existed before the Sherman Act, and that contracts advantageous to both, and agreed upon by both, are invalid because they take customers out of the market.

The Sherman Act seeks to maintain competition as a means to the end that trades may be made and closed, and not to forbid con-

tracts in order that competition for particular customers may be perpetually maintained.

A public auction affords perhaps the fairest means for competition, but when the hammer falls the purpose for which the public auctioneer was employed is accomplished; competition has achieved its end—a binding contract.

If between the parties the contract is fair and has relation to the consideration which each is to render, if nothing which has no relation to this is inserted, the contract must be upheld even though it may destroy a third person's chances for competition. We must find in the leases, or in the conduct of the defendants in offering them, or in enforcing them, something which "transcended what was necessary to protect the use of the patent or the monopoly which the law conferred upon it." Standard Sanitary Mfg. Co., 226 U. S., 20, 48.

1528 If, for the sake of the competing manufacturer of shoe machinery, it was sought to obviate the objection that the leases are too long, a reservation to the shoe manufacturer of a choice to terminate his lease at any time would seem to be all that could reasonably be asked. If allowed an opportunity to choose at any time between the machines he has taken and the machines of others, this should answer the objection to the length of the leases.

But the shoe manufacturer has such a choice.

The exclusive use and cancellation clauses serve to facilitate this choice and not to prevent it. If the defendants exercise their rights under these clauses he is freed completely, and thus becomes a possible customer for a competitor. If the defendants do not exercise their rights, he continues bound by his agreement for the payment of royalties; but subject to this he may, as we have seen, without actionable breach of contract, install at once the machinery of others.

The contention of the United States that it is unlawful to make the shoe manufacturer, by the exclusive use clause, choose between the defendants' machines and other machines, we have seen cannot be sustained on behalf of the shoe manufacturer. Nor can it be sustained on behalf of the manufacturer of shoe machinery, for it opens to him a chance for competition. All cancellation clauses if exercised are in one way favorable to him. They are unfavorable only so far as the shoe manufacturer may desire to retain the machinery of the defendants.

In reality what stands in the way of a competitor is the desire of the shoe manufacturer to retain his rights under the leases. If compelled to choose he will choose the defendants' machinery, and thus the defendants, upon such choice, will win in competition.

It is quite true that when a shoe manufacturer has installed several machines under the prohibitive leases the extra cost of changing

all his prohibitive leases for independent leases may be so considerable that competition is difficult. He has taken the machines as a group, and one who has not a group to offer in substitution has little practical chance to compete. But a competitor must be able to compete. If leases for machines for use as a group are
1529 offered and accepted for sound business reasons, and if, because of the greater productivity of a group and of the less cost of maintenance, better prices can be made, the defendants and the shoe manufacturers need not forego the making of such contracts for the sake of possible competitors who may have only single machines to offer. Contracts for large equipments of machinery, furniture, and other articles are too common to be condemned for such reason.

The United States treats the question of the leases rather as an abstract or verbal question than as a practical question or a question of substance. The grouping of machines, each protected by one or more distinct patents, is treated as a mere artifice for making one machine aid another in a trade for machinery.

The assumption that it is highly desirable that the shoe manufacturer should be at liberty to group the defendants' machines with such other machines, taken from other manufacturers, as he may see fit, ignores the fact that though machines may be treated in the Patent Office as separate, in a shoe factory the machines have a very definite mechanical relation to each other and to the particular method of making a shoe. The grouping of machines in order that some may aid others in turning out a product affords a sufficient mechanical reason for installing them as groups and a sufficient business reason for dealing with them as groups.

That there are sound mechanical and business reasons for grouping together machinery as it is grouped by a series of prohibitive leases is abundantly established. The United States fails to show that the grouping of the machines is in fact made merely as an unlawful artifice and not because of sound mechanical and business reasons. It has referred to certain leases in which there appears to be no necessary mechanical relation between some of the machines grouped. Thus to a limited extent it may be true that the grouping is for the purpose of trade or of contract rather than because of the close relation of the machines in process of manufacture; but this is insufficient to show that the principal purpose was not, as is contended by the defendants, to secure by efficient cooperation of machines a larger production of shoes.

A contract for a group of related machinery, or for a sup-
1530 ply of machines not immediately related but used only in separate mechanical steps of a manufacturing business, is an entirely proper and normal contract. The matter cannot be better

stated than by Judge Putnam in United States v. Winslow, 195 Fed., 578, 592:

"It seems to be impossible to deny that the combination of various elements of machinery, all relating to the same art and the same school of manufactures, for the purpose of constructing economically and systematically and of furnishing any customer, the whole or any part of an entire system, is in strict and normal compliance with modern trade progress, as also it might be in strict compliance with modern progress to limit the manufacture and supply to certain details, as, for example, steam gauges, wheels for railroads cars, or axles for steam locomotives, without furnishing anything else, although by so doing the manufacturer of details becomes able to command the entire market. It is absolutely normal and in accordance with the rightful demand of the market for any dealer to supply mere details or an entire system of machinery, according as his customers may desire."

It may be admitted that the inducements offered by the United Company in the complete or partial installation of a machine equipment on terms which relieve the manufacturer from the expense of an initial payment and from the loss by deterioration make it a very formidable competitor. It may be assumed that the difficulty of introducing competing machines into factories so supplied is very great; but that this difficulty arises from the insertion of clauses in the leases which were directed at competitors, and were not inserted for the purpose of defining and securing a reasonable compensation to the defendants for the use of their patents and machinery, has not been made to appear.

The main purpose, to insure such permanency of the relation between lessor and lessees as has been agreed upon, being legitimate, and the judgment of a large number of practical men who have separately, and without concurrent action, accepted what was offered them by the United Company upon the terms offered being the best proof of the reasonableness of these terms, we must hold that

1531 the difficulty of a competitor arises from the fact that customers are already supplied rather than from any provisions designed to hold these customers to what they have agreed to, or which provide for the termination of the leases and the freeing of the manufacturer from his contracts with the United Company.

The free field in competition to which a new manufacturer of shoe machinery is at this date entitled is not a field where there is no prior art, nor where the shoe manufacturers are unsupplied with machinery, nor where there is an unsatisfied demand for machinery in every factory. One who goes into a field of manufacture already occupied must expect to find factories so fully equipped that they are no longer customers.

Counsel for the United States do not, however, sufficiently recognize the difference between the commercial situation relating to patented articles and that relating to articles of general production. The inventor seeks to displace by invention inferior methods, and such displacement is encouraged by giving to the patentee a free field for his invention, and by giving him the right to offer it upon such terms as he may induce the public to accept. During the period of monopoly he may establish a good will which will give him after the expiration of his patents a formidable advantage in competition over imitative manufacturers. Frequently this good will and the development of his business may be such as to practically and lawfully exclude competition after the expiration of his patents. When a thing is so successfully accomplished and perfected as to satisfy all requirements, further invention in that field is often discouraged. The manufacture of complicated machines, in order to be profitable, must be on a large scale and by an organization having mechanical skill.

The defendants saw before them a large field for the business of supplying labor-saving machines to shoe manufacturers. They saw, as was expressed in a circular of the Goodyear Shoe Machinery Company, dated February 8, 1889, "The great advantages to be secured by the control in one corporation, both in the United States and in foreign countries, of the most efficient types of shoe machinery." This circular, instead of affording evidence of an improper purpose, shows a plan whose development has been of
1532 great advantage to the industry of shoemaking, and which has been determined to be lawful by the Supreme Court in United States v. Winslow, 227 U. S., 202, 217.

It was but natural that a company dealing with shoe manufacturers, in respect to a device for labor saving upon one operation of shoe manufacture, should extend its business so as to be able to supply labor-saving devices for other distinct operations. As the operations in making a shoe are said to be 150, more or less, it was a natural development, after effecting a saving in one operation, to invent mechanical means for saving in other operations. Instead of closing the door to invention, invention in the art of shoe machinery was thus greatly developed and greatly encouraged.

A company of sufficient capital to furnish a large line of labor-saving devices for different operations in shoemaking, which devices must necessarily be more or less related to each other, would properly strive to furnish not only single machines but groups of machines, or an entire machine equipment. The enterprise of the defendants in developing and occupying a field in this way rendered it impossible, of course, for any subsequent organization to have the

advantages of an unoccupied field. It is impossible to believe that the defendants' equipment is in so many shoe factories for any other substantial reason than the merits of what they have had to offer. To say that this is due, in any substantial degree, to the fact that its leases run beyond the terms of patents, or because of the exclusive use, prohibitive or cancellation clauses, rests largely, if not entirely, upon assumption. But that the business of these defendants rests upon the lease provisions objected to in such a substantial amount as to constitute any factor of independent force in securing or maintaining a monopoly does not appear.

The clauses objected to are all subordinate and auxiliary to maintaining rights which unquestionably belong to the defendants; to charge their own prices and to choose as customers those who will pay those prices.

The attack of the United States is not upon these rights, but upon the particular mode in which they have sought to exercise them.

Other modes, such as the requirement of arbitrary pay-
1533 ment for the full period of the patents, would escape all such attacks. The attack arises from the attempt to adjust the payments to the amount of use which particular manufacturers may have for the patented inventions.

The defendants very forcibly contend that no decree for the United States can be based upon the leases alone as an independent ground for relief, for the reason that the leases were presented merely as parts of a general plan of monopoly. They, in turn, rely upon United States v. Reading Co., 226 U. S., 324; but to show that the petition can not be sustained under the first section of the anti-trust act, and insist also that the question whether the leases are contracts in restraint of trade can not be determined because the lessees have not been joined as parties, and are not before the court.

They further insist that the subject-matter of the leases is substantially different from the subject-matter of the petition, and requires that the defendants be given an opportunity to introduce specific evidence as to the different patents and different machines.

The defendants during the trial have waived no rights in respect to these contentions.

In view of the fact that my conclusions upon the merits of the lease question are favorable to the defendants, I pass these objections without a decision upon their validity.

In view of the full discussion of the other portions of the case by my associates, I need only state my general concurrence in their conclusions, and that I concur in all respects in the opinion of Judge Dodge upon the lease question, as well as upon all other questions in the case.

1534 *Decree, May 14, 1915.*

PUTNAM and DODGE, Circuit Judges, and BROWN, District Judge:

This cause came on to be heard at the March term of this court, to wit: On the 20th of May, 1913, and hearings were held from time to time thereafter; the evidence of all the witnesses (except certain testimony as to patents which was taken by an examiner, as further appears in the record of this cause) being heard orally in open court by three judges, a certificate of the Attorney General for speedy hearing by three judges having been filed on May 20, 1912, under act of Congress of February 11, 1903, 32 Stat., 823, and the court having carefully considered the pleadings of the parties and their evidence, and heard the counsel. Now, on motion of Charles F. Choate, jr., Esq., of counsel for the defendants, it is ordered, adjudged, and decreed that the bill of the United States of America be, and the same hereby is, dismissed.

All stipulations of record in the cause in respect to disbursements are hereby confirmed and decreed.

By the court:

WILLIAM NELSON, *Clerk.*

1535 *Petition of United States for appeal and assignment of errors.*

[Filed May 15, 1915.]

Petition for appeal.

The United States of America feeling itself aggrieved by the final decree entered in the above-entitled cause comes by counsel into open court and prays an appeal from the said decree to the Supreme Court of the United States.

The particulars in which the United States considers said decree erroneous are set forth in the assignment of errors herewith filed, to which reference is made.

The United States further prays that a transcript of the record, proceedings, papers, and evidence upon which said decree was based, duly authenticated, may be transmitted to the Supreme Court of the United States; and that the United States may have until October 1, 1915, within which to file such transcript of record with the clerk of the Supreme Court and to docket its said appeal.

GEORGE W. ANDERSON,
United States Attorney.
H. LARUE BROWN,
Special Assistant to the Attorney General.

Dated this 15th day of May, 1915.

Allowed May 15, 1915.

FREDERIC DODGE,
U. S. Circ. J.

1536 Assignment of errors.

Comes now the United States of America by counsel and in connection with its application for appeal from the final decree pronounced in the above-entitled cause on the 18th day of March, 1915, presents in open court the following assignment of errors upon which it will rely upon said appeal.

The court erred.

I.

In dismissing the bill.

II.

In failing to adjudge that the United Shoe Machinery Company of New Jersey is a combination in restraint of interstate and foreign trade and commerce and that it has attempted and is attempting in combination with other persons and corporations to monopolize and that it has monopolized part of the trade and commerce among the several States of the United States and with foreign nations.

III.

In failing to adjudge that the United Shoe Machinery Corporation is a combination in restraint of interstate and foreign trade and commerce and that it has attempted and is attempting in combination with other persons and corporations to monopolize and that it has monopolized part of the trade and commerce among the several States of the United States and with foreign nations.

IV.

In refusing to decree that each of said defendant corporations be dissolved and a new condition brought about in harmony with and not repugnant to the law either as a consequence of the
1537 action of this court in determining an issue or in accepting a plan agreed upon; or, failing such dissolution, that each of said corporations be restrained from engaging in interstate or foreign commerce.

V.

In refusing to adjudge that the holding of stock by any of the denfendant corporations in other corporations as alleged in part seven of the bill herein is illegal, and in refusing to enjoin and

restrain said corporation from continuing to hold or own such shares and from exercising any rights in connection therewith.

VI.

In refusing to adjudge that the acquisitions set out and described in part VII of the petition herein, or any of them, were acts in unlawful restraint of interstate and foreign commerce and done in pursuance of a purpose to monopolize part of the interstate and foreign commerce in machinery adapted to the manufacture of shoes and were illegal.

VII.

In refusing to adjudge that the lease and license agreements devised and used by the defendants, as described in part five of the bill, and agreements containing like or similar provisions are, in respect of the restrictive provisions therein contained, illegal.

VIII.

In refusing to enjoin and restrain defendants and each of them, and their officers, directors, stockholders, agents, and servants, and each of them, from enforcing or attempting to enforce any rights
existing or claimed under and by virtue of the restrictive
1538 provisions of such lease and license agreements.

IX.

In refusing to enjoin and restrain the defendants, and each of them, and their officers, directors, stockholders, agents, and servants, and each of them, from making in the future or insisting upon or enforcing any contracts, arrangements, agreements, or requirements with their customers relating to the loan, lease, or purchase from the defendants of machinery, mechanism, tools, or devices under which it is a condition of said agreements or contracts of lease, purchase, or loan that the defendants shall not acquire by lease, loan, or purchase from competitors of the defendants machines of similar character or shall not use machinery, mechanism, tools, or devices obtained upon loan, lease, or purchase from the defendants in the manufacture of shoes made in part with the use of machinery obtained from competitors of the defendants.

X.

In refusing to enjoin and restrain the defendants, and each of them, their officers, directors, stockholders, agents, and servants, and each of them, from making discounts or granting to boot and shoe

manufacturers rebates, either by way of reduction, of royalties, or by any other scheme or device whatever, as an inducement to persuade such manufacturers to use exclusively machines, mechanisms, tools, or devices owned or controlled by the defendants.

1539

XI.

In refusing to allow the motion of the United States to be permitted to amend its bill in the manner and under the circumstances disclosed by the record.

XII.

In refusing to adjudge that the combinations, contracts, and conspiracies described in the bill are illegal and that all acts done in furtherance of the same are in violation of the act of July 2, 1890, entitled "An act to protect trade and commerce against unlawful restraints and monopolies," and to enjoin and restrain the defendants, and each of them, their officers, directors, stockholders, agents, and servants, and each of them, from doing any act in pursuance of or for the purpose of carrying out the same.

XIII.

In refusing to enter a decree in favor of the United States of America upon its petition herein and to order that its costs shall be paid by the defendants.

GEORGE W. ANDERSON,
United States Attorney.
H. LARUE BROWN,
Special Assistant to the Attorney General.

1540

Supreme Court of the United States.

Appeal from the District Court of the United States for the District of Massachusetts, in case entitled in that court,

THE UNITED STATES OF AMERICA
v.
UNITED SHOE MACHINERY COMPANY, OF New Jersey et al.

No. 301, Equity Docket (C. C. 911).

Order of enlargement of time for docketing case and filing record, May 17, 1915.

For good cause shown, it is ordered that the time for docketing this case and filing the record thereof with the clerk of this court be enlarged to and including Friday, October 1, 1915.

FREDERIC DODGE,
U. S. Circuit Judge.

1541 *Plaintiff's praecipe.*

[Filed September 7, 1915.]

To the clerk of said court:

The United States of America desires the following portions of the record of the above-entitled cause to be incorporated into the transcript on its appeal to the Supreme Court of the United States, namely, the petition of the plaintiff without the exhibits attached thereto, the answers of the several defendants, the replications of the plaintiff, the plaintiff's bill of particulars, the defendants' objections thereto, and all motions, orders of court, and the final decree filed in said cause; all the physical exhibits, the exhibits printed in Volumes IX, X, and XII of the Record as printed for the District Court, the testimony taken before the examiner as it appears in Volume V of said printed Record, and the evidence taken before the court as it is stated in narrative form in the transcript herewith lodged; also this praecipe, notice to counsel of its lodgment with the clerk, and of the time and place when the plaintiff will ask the court to approve plaintiff's statement of the evidence which it desires the court to approve and make a part of the record, and the return of the officer showing service of said praecipe and notice, together with the petition of the United States for appeal and its assignment of errors, and all orders, citations, and decrees of said district court made in connection therewith and in furtherance thereof.

GEORGE W. ANDERSON,
United States Attorney.
C. J. SMYTH,
H. LARUE BROWN,
Special Assistants to the Attorney General.

1542 BOSTON, *September 7th, 1915.*

UNITED STATES OF AMERICA,
District of Massachusetts, ss:

I hereby certify that I have this day made diligent search for Charles F. Choate, Esq., counsel for the within-named United Shoe Machinery Company of New Jersey and others, at his office at 30 State Street, said Boston, but was unable to find him, or his whereabouts in said district. Accordingly I have, by direction of Leo A. Rogers, Esq., Assistant U. S. Attorney, left at the office of the said Charles F.

Choate, at said 30 State Street, an attested copy of this precept in the hands of Miss Mary F. Hannigan, his secretary.

JOHN J. MITCHELL, *U. S. Marshal.*
By CHARLES A. BANCROFT, *Deputy.*

Fees:
Service, $2.00
Travel, .06
—— $2.06

1543 *Copy of notice of filing of præcipe and lodgment of statement in narrative form of evidence.*

[Filed September 7, 1915.]

BOSTON, *September 7, 1915.*

CHARLES F. CHOATE, JR., Esq.,
30 State St., Boston, Mass.

SIR: You are hereby notified that the United States has this day filed its præcipe with the clerk of the United States District Court for the District of Massachusetts in case #301 in equity, United States of America v. United Shoe Machinery Company of New Jersey, and others, indicating the portions of the record to be incorporated into its transcript on its appeal, and has lodged with the clerk of said court a statement in narrative form of the evidence which it desires to be included in said transcript on its appeal.

You are further notified that on Friday, September 18th, 1915, at ten o'clock a. m., or as soon thereafter as counsel can be heard, at Boston, in said District of Massachusetts, the United States will ask said District Court to approve said statement.

Respectfully,
For the United States Attorney:
(Signed) LEO A. ROGERS,
Assistant U. S. Attorney.

A true copy:
Attest:
CHARLES A. BANCROFT,
Deputy U. S. Marshal.

1544 UNITED STATES OF AMERICA,
District of Massachusetts, ss:

BOSTON, *September 7th, 1915.*

I hereby certify that I have this day made diligent search for the within-named Charles F. Choate, Esq., at his office at 30 State

Street, said Boston, but was unable to find him or his whereabouts in said district; accordingly I have, by direction of Leo A. Rogers, Esq., assistant U. S. attorney, left at the office of the said Charles F. Choate, at said 30 State Street, the original, of which the within is an attested copy, in the hands of Miss Mary F. Hannigan, his secretary.

JOHN J. MITCHELL, *U. S. Marshal*,
By CHARLES A. BANCROFT, *Deputy*.

Fees:
Service, $2.00.

1545 *Motion for extension of time.*

[Filed September 10, 1915.]

And now come the defendants in the above-entitled action and move that the time for incorporating additional portions of the record for filing objections and amendments proposed by the defendants and for approving the statement of the evidence be extended to January 1, 1916.

CHAS. F. CHOATE, Jr.,
Attorney for the Defendants.

Order extending time for incorporating additional portions of the record.

[September 11, 1915.]

DODGE, J. On defendants' motion, filed September 10, 1915, for extension of the time for incorporating additional portions of the record for filing objections and amendments proposed by defendants and for proving the statement of the evidence, it being at present uncertain on what day the entire court can be got together; it is hereby, after hearing the parties, counsel for the petitioner not assenting but objecting thereto, ordered as follows:

For good cause shown, that said time be extended as requested by said motion to January 1, 1916; this order to be without prejudice to the right of the petitioner to apply to the full court for such other or different limitation of said time as it may consider desirable.

By the court:

WILLIAM NELSON, *Clerk*.

1546 Supreme Court of the United States.

Appeal from the District Court of the United States for the District of Massachusetts, in case entitled in that court,

THE UNITED STATES OF AMERICA *v.* UNITED SHOE MACHINERY COMPANY, OF New Jersey, et al.	No. 301, Equity Docket (C. C. 911).

Order of enlargement of time for docketing case and filing record, September 11, 1915.

For good cause shown, it is ordered that the time for docketing this case and filing the record thereof with the clerk of this court be enlarged to and including Saturday, January 15, 1916.

FREDERIC DODGE,
U. S. Circuit Judge.

1547 *Petition for limitation of time for filing objections to statement of evidence.*

[Filed September 27, 1915.]

Now comes the petitioner and moves the court to reduce and restrict the time heretofore granted by his honor Judge Dodge to the defendants for the preparation and submission by them of objections or amendments to the statement of the evidence prepared by the petitioner and heretofore filed in said cause, so that the defendants will be required to present and submit such objections and amendments on or before the first day of November, 1915, and petitioner hereby requests that this motion be heard and passed upon by the same court which tried the case, to wit, the court organized under the expediting act for that purpose.

UNITED STATES OF AMERICA,
By GEORGE W. ANDERSON,
United States Attorney.

C. J. SMYTH,
H. LARUE BROWN,
Special Assistants to the Attorney General.

1548 District Court of the United States, District of Massachusetts.

THE UNITED STATES OF AMERICA *v.* UNITED SHOE MACHINERY COMPANY, OF New Jersey, et al.	Equity Docket, No. 301 (C. C. 911).

Order of enlargement of time for docketing case and filing record, September 30, 1915.

For good cause shown it is ordered that the time for docketing this case and filing the record thereof in the Supreme Court of the United States be enlarged to and including Saturday, January 15, 1916.

FREDERIC DODGE,
U. S. Circuit Judge.

1549 *Docket entry of October 13, 1915.*

October 13, 1915. PUTNAM, DODGE & BROWN, JJ. Heard on petition for limitation of time for filing objections to statement of evidence; ordered, against objections of the United States, that order entered September 11, 1915, by Dodge, J., stand.

1550 *Defendants' Praecipe for portions of the record for the transcript upon appeal.*

[Filed December 24, 1915.]

To Honorable William Nelson, clerk of the United States District Court, District of Massachusetts.

The defendants desire the following additional portions of the record of the above-entitled cause to be incorporated into the transcript of the record for the appeal allowed in this cause to the Supreme Court of the United States, namely:

(1) The petition, without the exhibits attached thereto.
(2) The answers of the several defendants.
(3) The replications of the petitioner.
(4) Petitioner's motion for leave to dismiss as to certain defendants, filed April 16, 1912.
(5) The order of the court upon said motion, April 16, 1912.
(6) The certificate of expedition, filed May 20, 1912.

(7) Defendants' motion for a bill of particulars, filed May 28, 1913.

(8) Petitioner's response to defendants' motion for a bill of particulars, under Section VI of the petition, filed June 25, 1913.

(9) Order of court directing the taking of testimony, with respect to patents, before an examiner, June 27, 1913.

(10) Stipulation, filed July 23, 1913.

(11) Order extending time for taking testimony before
1551 examiner under order dated June 27, 1913, August 8, 1913.

(12) Order extending time for taking testimony before examiner under order dated June 27, 1913, September 12, 1913.

(13) Petitioner's two motions to strike out, filed December 2, 1913.

(14) List of parts of exhibits to be specifically relied upon by petitioner, etc., filed December 9, 1913.

(15) Stipulation as to objections to testimony and further examination before special examiner, made January 14, 1914, filed January 19, 1914.

(16) Request for leave to amend petition, filed January 14, 1914.

(17) Objections of defendants to motion of the United States to amend its bill, made January 14, 1914, filed February 3, 1914.

(18) Order of court, February 4, 1914.

(19) Order of court, February 10, 1914.

(20) Opinions of Putnam and Dodge, circuit judges, and Brown, district judge, filed March 18, 1915.

(21) Final decree, entered May 14, 1915.

(22) Petition for appeal and assignment of errors by the United States, filed May 15, 1915.

(23) Order of court, May 15, 1915.

(24) Praecipe, filed by petitioner September 7, 1915.

(25) Copy of notice of filing of praecipe and lodgment of statement in narrative form of the evidence, filed by petitioner September 7, 1915.

1552 (26) Motion of defendants for extension of time, filed September 10, 1915.

(27) Order of court, September 11, 1915.

(28) Order of court, September 30, 1915.

(29) Abstract of the evidence which is lodged herewith incorporating defendants' objections and amendments to the abstract of the evidence before the court, filed by petitioner September 7, 1915, and the additional portions of the record which defendants desire to have incorporated into the transcript; and also incorporating an abstract of the testimony in Volume V of the record in the district court.

(30) This praecipe, notice to counsel of its lodgment with the clerk of said court, and the return of the officer showing service of said praecipe and notice.

(31) Any further orders which may be made by the district court.

(32) The exhibits which were printed in Volumes IX, X, and XII of the district court record, with the exception of those exhibits which appear in full in said abstract of the evidence, namely, defendants' Exhibits Numbered 105, 211, 215, 216, 218, 225, 226, 230, 230A, 234, 249, 251, 252, 253, 254, 259, 260, 261, 263, 264, 265, 266, 267, 270, 271, 272, 273, 274, 275, 331, 333, 334, 341, 342; and in lieu of each of these last-named exhibits it is requested that a page be substituted stating the title of the exhibit and the page in said abstract where said exhibit appears.

(33) All the physical exhibits, namely:

Plaintiff's Exhibits Numbered 162, 190, 193, 194, 220, 243, 244, 249, 251A, 251B, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 266, 268, 280, 281, 282, 283, 284, 285, 286, 287, 288.

1553 Defendants' Exhibits numbered 1, 2, 3, 4, 5, 6, 7, 8, 9, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 72, 73, 76, 100, 102, 103, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 241, 255, 256, 257, 268, 276, 277, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 335, 340, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359.

FREDERICK P. FISH,
CHAS. F. CHOATE, Jr.,
MALCOLM DONALD,
Solicitors for Defendants.

DECEMBER 24, 1915.

If and in so far as the within præcipe is properly directed to me as United States attorney for the District of Massachusetts service thereof is hereby acknowledged, waiving, however, no objection either as to form or substance or as to the time of the return thereof, counsel in actual charge of said case for the Government being C. J. Smyth, Esq., of Omaha, Nebraska, and H. L. Brown, now commorant in Washington, D. C.

GEORGE W. ANDERSON.

1554 BOSTON, *December 24, 1915.*

UNITED STATES OF AMERICA,

I hereby certify that I have this day served the within præcipe on the Hon. U. S. district attorney, George W. Anderson, by giving

to him in hand an attested copy of the within defendants' præcipe, at Boston, in said district.

JOHN J. MITCHELL,
U. S. Marshal,
By JOSEPH A. MURPHY,
Deputy.

Fees:
Service, $2.00
Travel, .06
$2.06

1555 *Notice of filing of defendants' præcipe and abstract of evidence and marshal's return of service.*

[Filed December 24, 1915.]

To HONORABLE GEORGE W. ANDERSON,
United States attorney, Boston, Massachusetts:

You are hereby notified that on December 24th, 1915, the defendants filed, with the clerk of said court, defendants' præcipe for portions of the record for the transcript upon appeal, of which a true copy is hereto attached; and lodged with the clerk of said court their abstract of the evidence in this cause, incorporating their objections and amendments to the abstract of the evidence before the court, filed by petitioner September 7, 1915, and the additional portions of the record which they desire to have incorporated into the transcript; and also incorporating an abstract of the testimony in Volume V of the record in the District Court.

You are further notified that on Tuesday, January 4th, 1916, at ten o'clock a. m., or as soon thereafter as counsel can be heard, defendants will ask said District Court to approve said abstract of the evidence.

FREDERICK P. FISH,
CHAS. F. CHOATE, Jr.,
MALCOLM DONALD,
Solicitors for Defendants.

1556 BOSTON, *December 24th, 1915.*

UNITED STATES OF AMERICA,
District of Massachusetts, ss:

I hereby certify that I have served the within notice on the within named George W. Anderson, U. S. attorney, by giving to him in hand an attested copy of the within notice at Boston in said district.

JOHN J. MITCHELL,
U. S. Marshal,
By JOSEPH A. MURPHY,
Deputy.

Fees:
Service, $2.00.

1557 *Defendants' motion to approve abstract of testimony.*

[Filed January 4, 1916.]

Now come the defendants and move this court to approve the abstract of the evidence in the above-entitled case, filed by the defendants with their præcipe.

By their solicitors:

FREDERICK P. FISH,
CHAS. F. CHOATE, Jr.,
MALCOLM DONALD.

1558 *Docket entry of January 4, 1916.*

January 4, 1916. PUTNAM, DODGE & BROWN, JJ: Heard on question of make-up of appeal record. Defendants' written motion to approve their abstract of evidence filed. Heard and action postponed.

1559 *Motion to extend time for docketing appeal.*

[Filed January 12, 1916.]

The United States moves that the time for docketing in the Supreme Court of the United States its appeal in the above-entitled case be extended to March 15, 1916.

GEORGE W. ANDERSON,
United States Attorney.
H. LARUE BROWN,
Special Assistant to the Attorney General.

Defendants assent to allowance of this motion.

CHAS. F. CHOATE, Jr.,
For Defendants.

1560 District Court of the United States, District of Massachusetts.

THE UNITED STATES OF AMERICA *v.* UNITED SHOE MACHINERY COMPANY, OF New Jersey, et al.	Equity Docket, No. 301 (C. C. 911).

Order of enlargement of time for docketing case and filing record, January 12, 1916.

For good cause shown, it is ordered that the time for docketing this case and filing the record thereof in the Supreme Court of the United States be enlarged to and including Wednesday, March 15, 1916.

FREDERIC DODGE,
U. S. Circuit Judge.

1561 *Motion to extend time for docketing transcript of appeal.*

[Filed March 11, 1916.]

Now comes the United States and moves that the time for docketing in the Supreme Court of the United States its appeal in the above-entitled cause be extended to May 1, 1916.

GEORGE W. ANDERSON,
United States Attorney.
C. J. SMYTH,
H. LARUE BROWN,
Special Assistant to the Attorney General.

The defendants being asked by the United States to grant further accommodation in point of time, will not oppose the granting of this motion.

By their atty.,

CHAS. F. CHOATE, JR.

1562 District Court of the United States, District of Massachusetts.

THE UNITED STATES OF AMERICA *v.* UNITED SHOE MACHINERY COMPANY, OF NEW JERSEY, et al.	Equity Docket, No. 301 (C. C. 911).

Order of enlargement of time for docketing case and filing record, March 11, 1916.

For good cause shown, it is ordered that the time for docketing this case and filing the record thereof in the Supreme Court of the United States be enlarged to and including Monday, May 1, 1916.

FREDERIC DODGE,
U. S. Circuit Judge.

1563 *Motion to extend time for docketing transcript of appeal.*

[Filed April 28, 1916.]

Now comes the United States and moves that the time for docketing in the Supreme Court of the United States its appeal in the above-entitled cause be extended to June 1, 1916.

GEORGE W. ANDERSON,
United States Attorney.
C. J. SMYTH,
H. LARUE BROWN,
Special Assistants to the Attorney General.

At the request of the United States the defendants assent to the allowance of this motion.

C. F. CHOATE, JR., *for Defendants.*

1564 District Court of the United States, District of Massachusetts.

THE UNITED STATES OF AMERICA *v.* UNITED SHOE MACHINERY COMPANY, OF NEW JERSEY, et al.	Equity Docket, No. 301 (C. C. 911).

Order of enlargement of time for docketing case and filing record, April 28, 1916.

For good cause shown, it is ordered that the time for docketing this case and filing the record thereof in the Supreme Court of the United States be enlarged to and including Thursday, June 1, 1916.

FREDERIC DODGE,
U. S. Circuit Judge.

1565 *Motion to extend time for docketing transcript of appeal.*

[Filed May 31, 1916.]

Now comes the United States and says that since October 1, 1915, on which date the time for docketing the appeal of the United States in the above-mentioned cause was first extended, the parties, by their counsel, have been in repeated conference for the purpose of reaching an agreement upon the form in which the 4,979 printed pages of the testimony and the four volumes of exhibits of the record in this case as made up for the District Court shall be presented to the Supreme Court; that the work has proceeded with all the expedition reasonably possible under the circumstances and by far the greater portion of said testimony has become the subject of such agreement and has been stated in accordance with the same, but the parties have not yet completed the labor of reaching an agreement upon the entire record. In order, therefore, to afford time to reach or to attempt to reach such complete agreement, the United States moves that the time for docketing its appeal be extended until July 1, 1916.

GEO. W. ANDERSON,
United States Attorney.
H. LARUE BROWN,
Special Assistant to the Attorney General.

1566 District Court of the United States, District of Massachusetts.

THE UNITED STATES OF AMERICA *v.* UNITED SHOE MACHINERY COMPANY OF NEW JERSEY et al.	Equity docket, No. 301 (C. C. 911).

***Order** of enlargement of time for docketing case and filing record, May 31, 1916.*

For good cause shown, it is ordered that the time for docketing this case and filing the record thereof in the Supreme Court of the United States be enlarged to and including Saturday, July, 1, 1916.

FREDERIC DODGE,
U. S. Circuit Judge.

Defendants assent to entry of this order by their atty.

CHAS. F. CHOATE, Jr.

1567 *Substituted praecipe of United States.*

[Filed June 19, 1916.]

To the clerk of said court:

Now comes the United States of America, petitioner and appellant in the above-entitled case, and substitutes the following for the praecipe heretofore filed in said case on September 7th, 1915, that is to say:

The United States of America desires the following portions of the record of the above-entitled case to be incorporated in the transcript on its appeal of said case to the Supreme Court of the United States, namely:

(1) The petition of the United States without the exhibits thereto.

(2) The answers of the several defendants.

(3) The replications of the United States.

(4) Expediting certificate filed May 20th, 1912.

(5) Protest of United States against private hearings filed May 22nd, 1912.

(6) Order with respect to private hearings filed August 28th, 1912.

(7) Motions of the United States to strike out evidence filed December 2nd, 1913, and order thereupon.

(8) Motion of defendants for bill of particulars filed May 28th, 1913.

(9) Bill of particulars filed June 25th, 1913.

(10) Objections thereto filed.

1568 (23) Order of Judge Dodge that defendants be given until January 1st to file their objections and suggestions of amendments to the reduced statement of facts of the evidence filed by the United States.

(24) Order of Circuit Judges Putnam and Dodge and District Judge Brown approving the order of Judge Dodge filed October 13th, 1915.

(25) Notice by the defendants to the United States of the filing of their objections, etc., filed December 24th, 1915.

(26) Order postponing hearing on last-mentioned motion filed January 4th, 1916.

(27) Order extending time for docketing case on appeal filed January 12th, 1916.

(28) Order extending time for docketing case on appeal filed March 11th, 1916.

(29) Order extending time for docketing case on appeal filed April 28th, 1916.

(30) Order extending time for docketing case on appeal filed May 31st, 1916.

(31) The testimony approved by the court June 19, 1916, and filed as a part of the record for the purposes of the appeal.

(32) All of the physical exhibits introduced in the course of the trial.

1569 (11) Requests of the United States for leave to amend petition and the amendments requested filed January 14th, 1914.

(12) Order denying requests of the United States for leave to amend, filed February 4th, 1914.

(13) Opinions of the judges, filed March 18th, 1915.

(13a) Final decree, filed May 14th, 1915.

(14) Petition of the United States for appeal and assignment of errors, filed May 15th, 1915.

(15) Order allowing petition for appeal, filed May 15th, 1915.

(16) Citation and proof of service thereof, filed May 15th, 1915.

(17) Order enlarging time for docketing case and preparing reduced statement of the evidence, filed May 15, 1915.

(18) Praecipe of the United States filed September 7th, 1915, and return of service thereof, notice to counsel of its lodgment, and of time of place at which United States would ask court to approve its statement of the evidence and proof of service thereon.

(19) Motion for extension of time, filed September 10th, 1915.

(20) Order extending time, filed September 11th, 1915.

(21) Order enlarging time for docketing case, filed September 11th, 1915.

(22) Petition for limitation of time, filed by United States September 27, 1915.

1570 (33) This substituted praecipe, filed June 19th, 1916.

(34) Stipulation of parties filed 19th of June, 1916.

(35) Order of court approving evidence and making it a part of record, filed June 19th, 1916.

THE UNITED STATES OF AMERICA,
By GEO. W. ANDERSON,
United States Attorney.
CONSTANTINE J. SMYTH,
H. LARUE BROWN,
Special Assistants to the Attorney General.

1571 *Stipulation.*

[Filed June 19, 1916.]

It is hereby stipulated and agreed by and between the parties to the above entitled action that the District Court may approve as part of the evidence in said case Volumes V, IX, X, and XII, inclusive, of the evidence and exhibits, as the same have been printed for the use of the District Court in said case and identified by the signatures of H. LaRue Brown and Nelson W. Howard on the first and last page of each volume thereof.

It is also stipulated and agreed that the typewritten manuscript consisting of 1,229 pages in three volumes and identified by the signatures of H. LaRue Brown and Nelson W. Howard on the first and last pages of each volume thereof comprises the testimony of all the witnesses who testified in open court and that the statement of the same contained in said manuscript is true, complete, and properly prepared and may be approved by the court.

It is further stipulated that the evidence contained in said Volumes V, IX, X, and XII, together with that in said typewritten manuscript, and the physical exhibits now on file with the clerk, constitute all the evidence taken in said case that is material or pertinent to the appeal from the decree therein, and the same, after Volumes V, IX, X, and XII, and said manuscript have been approved as aforesaid, shall be filed by the clerk as a part
1572 of the record in said case for the purposes of the appeal.

It is further stipulated and agreed that the clerk of the District Court shall send the original typewritten manuscript referred to in the preceding paragraph to the clerk of the Supreme Court of the United States as a part of the record in the case on appeal and that a printed copy of the same, when prepared by the clerk of said last mentioned court, may be substituted for the original manuscript in the files of the clerk of the District Court.

It is further stipulated and agreed that the clerk of the District Court shall certify as the record on appeal said Volumes V, IX, X, and XII, said typewritten manuscript verified as stated above, and said physical exhibits, and all papers not included in the above which are named in the praecipes or substitute praecipes of both parties, it being understood that no papers shall be duplicated in the transcript of the record.

It is further stipulated and agreed that the approvals aforesaid by the court, Judge Dodge presiding, shall have the same force and effect as if Judge Putnam and Judge Brown had been present and participated in said approvals.

GEO. W. ANDERSON,
United States Attorney.
CONSTANTINE J. SMYTH,
H. LARUE BROWN,
Special Assistants to the Attorney General.
CHAS. F. CHOATE, JR.,
Attorney for Defendants and Appellees.

1573 *Order June 19, 1916.*

Pursuant to the stipulation of the parties filed in this case on the 19th day of June, 1916, it is hereby ordered that the foregoing four (4) printed volumes numbered, respectively, V, IX, X, and XII of the evidence and exhibits, as the same have been printed for the use of the District Court in this case and identified by the signatures of H. LaRue Brown and Nelson W. Howard on the first and last pages of each volume thereof, and the foregoing typewritten manuscript consisting of 1,229 pages in three volumes and identified by the signatures of H. LaRue Brown and Nelson W. Howard on the first and last pages of each volume thereof, are hereby approved as being a true, complete, and properly prepared statement of all the evidence received or offered on the trial of said case, save the physical exhibits now on file with the clerk of said court, that is material or pertinent to the appeal from the decree therein, and of all rulings of the court with respect to said evidence, and that said four (4) Volumes V, IX, X, and XII, said typewritten manuscript, and said physical exhibits are hereby approved as all the evidence in said case material and pertinent as aforesaid, and are made a part of the record in said case for the purposes of the appeal.

By the court:

FREDERIC DODGE,
United States Circuit Judge.

The volumes referred to in this order accompany this record, being made up of seven volumes, each certified as appurtenant to this order.

1574 *Defendants' substitute praecipe for portions of the record for the transcript upon appeal.*

[Filed June 21, 1916.]

To Honorable William Nelson, Clerk of the United States District Court, District of Massachusetts:

The defendants desire the following additional portions of the record of the above entitled cause to be incorporated into the transcript of the record for the appeal allowed in this cause to the Supreme Court of the United States, namely:

(1) The petition, without the exhibits attached thereto.

(2) The answers of the several defendants.

(3) The replications of the petitioner.

(4) Petitioner's motion for leave to dismiss as to certain defendants, filed April 16, 1912.

(5) The order of the court upon said motion, April 16, 1912.

(6) Motion for appointment of a special examiner, filed April 20, 1912.

(7) Notice to take testimony, filed April 26, 1912.

(8) Docket entry, April 26, 1912, regarding notice to take testimony.

(9) Order appointing special examiner, entered April 26, 1912.

1575 (10) The certificate of expedition, filed May 20, 1912.

(11) Order that all further proceedings before the examiner cease until further order of court, entered May 22, 1912.

(12) Order of court designating three judges to sit in the case, entered May 28, 1912.

(13) Docket entry, August 28, 1912, as follows: Brown, J. (Colt, J., concurring; Putnam, J., sat at hearing but did not participate in this opinion, having previously expressed an opinion on the question as a single judge): Opinion, the examiner will not, without the consent of both parties, allow the attendance of persons other than those mentioned in rule 67. Opinion filed and entered.

(14) Opinion of the court, filed August 28, 1912.

(15) Docket entry, March 18, 1913, as follows: Putnam, Dodge & Brown, JJ. Dodge, J., sitting under the statute in place of Colt, J., who has resigned. Order striking out order appointing Charles K. Darling special examiner.

(16) Motion of petitioner for appointment of special master, filed March 20, 1913.

(17) Application of petitioner for leave to withdraw motion for appointment of special master.

(18) Docket entry, March 26, 1913, as follows: Putnam, Dodge & Brown, JJ. Ordered, there being no objection, the application of

the United States for leave to withdraw its motion for appointment of special master is allowed without prejudice. (Entered.)

(19) Petitioner's motion for hearing before court, filed May 13, 1913.

(20) Petitioner's alternate motion for hearing before an examiner, filed May 13, 1913.

(21) Docket entry, May 13, 1913, as follows: Putnam, Dodge & Brown, JJ. On motion for hearing of case in open court, ordered that case be assigned for hearing on Tuesday, May 20, 1913, at 10 a. m. (Entered in order book and journal.)

(22) Defendants' motion for a bill of particulars, filed May 28, 1913.

(23) Petitioner's response to defendants' motion for a bill of particulars, under Section VI of the petition, filed June 25, 1913.

(24) Order of court directing the taking of testimony, with respect to patents, before an examiner, entered June 27, 1913.

(25) Stipulation, filed July 23, 1913.

(26) Order extending time for taking testimony before examiner under order dated June 27, 1913, entered August 8, 1913.

1576 (27) Order extending time for taking testimony before examiner under order dated June 27, 1913, entered September 12, 1913.

(28) Stipulation in re printing of petitioner's exhibit 162, filed September 20, 1913.

(29) Petitioner's two motions to strike out, filed December 2, 1913.

(30) List of parts of exhibits to be specifically relied upon by petitioner, etc., filed December 9, 1913.

(31) Stipulation as to objections to testimony and further examination before special examiner, made January 14, 1914, filed January 19, 1914.

(32) Request for lease to amend petition, filed January 14, 1914.

(33) Objections of defendants to motion of the United States to amend its bill, made January 14, 1914, filed February 3, 1914.

(34) Order of court, entered February 4, 1914.

(35) Order of court, entered February 10, 1914.

(36) Opinions of Putnam and Dodge, circuit judges, and Brown, district judge, filed March 18, 1915.

(37) Final decree, entered May 14, 1915.

(38) Petition for appeal and assignment of errors by the United States, filed May 15, 1915.

(39) Order of court, entered May 15, 1915.

(40) Praecipe, filed by petitioner September 7, 1915.

(41) Copy of notice of filing of praecipe and lodgment of statement in narrative form of the evidence, filed by petitioner September 7, 1915.

(42) Motion of defendants for extension of time, filed September 10, 1915.

(43) Order of court, entered September 11, 1915.

(44) Order of court entered September 30, 1915.

(45) Order of court, entered October 13, 1915.

(46) Defendants' praecipe for portions of the record for the transcript upon appeal and return of service thereof, filed December 24, 1915.

(47) Notice of filing of defendants' praecipe and return of service thereof, filed December 24, 1915.

(48) Defendants' motion to approve abstract of evidence, filed January 4, 1916.

(49) Docket entry, January 4, 1916, as follows: Putnam, Dodge & Brown, JJ. Heard on question of make-up of appeal record. Defendants' written motion to approve their abstract of evidence filed. Heard and action postponed. (Entered.)

1577 (50) Petitioner's motion to extend time for docketing appeal, with assent by defendants, filed January 12, 1916.

(51) Order of enlargement of time for docketing case and filing record, entered January 12, 1916.

(52) Petitioner's motion to extend time for docketing transcript of appeal, with assent by defendants, filed March 11, 1916.

(53) Order of enlargement of time for docketing case and filing record, entered March 11, 1916.

(54) Petitioner's motion to extend time for docketing transcript of appeal, with assent by defendants, filed April 28, 1916.

(55) Order of enlargement of time for docketing case and filing record, entered April 28, 1916.

(56) Petitioner's motion to extend time for docketing transcript of appeal, filed May 31, 1916.

(57) Order of enlargement of time for docketing case and filing record, entered May 31, 1916, with defendants' assent thereto.

(58) Stipulation, filed June 19, 1916.

(59) Order, entered June 19, 1916.

(60) Abstract of the evidence before the court, filed June 19, 1916.

(61) The evidence taken before the examiner, as printed in Volume V of the District Court record.

(62) The exhibits as printed in Volumes IX, X, and XII of the District Court record.

(63) All the physical exhibits, namely:

Plaintiff's exhibits numbered 162, 190, 193, 194, 220, 243, 244, 249, 251A, 251B, 252, 253, 254, 255, 256, 257, 258 259, 260, 261, 262, 266, 267, 268, 280, 281, 282, 283, 284, 285, 286, 287, 288.

Defendants' exhibits numbered 1, 2, 3, 4, 5, 6, 7, 8, 9, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 72,

73, 76, 100, 102, 103, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 241, 255, 256, 257, 268, 276, 277, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 335, 340, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359.

1578 (64) This substitute praecipe.

(65) Any further orders which may be made by the District Court.

Solicitor for the Appellees.

(Indorsed:) In the Supreme Court of the United States. October term, 1916. No. 545. The United States, appellant, vs. United Shoe Machinery Company of New Jersey et al. Stipulation. Office of the clerk, Supreme Court, U. S. Received Jan. 15, 1917.

[Copy.]

In the District Court of the United States for the District of Massachusetts.

UNITED STATES OF AMERICA, PETITIONER, *v.* UNITED SHOE MACHINERY COMPANY OF New Jersey, and others, defendants.	Equity.

Certificate of Attorney General for speedy hearing under act of Congress of February 11, 1903.

(Filed May 20, 1912.)

the clerk of said court:

I hereby certify that the above-entitled cause now pending in said court is a suit in equity brought by the United States against the

United Shoe Machinery Company of New Jersey, and others, under the act of Congress entitled "An act to protect trade and commerce against unlawful restraints and monopolies," approved July 2, 1890, and that said suit is in my opinion a case of general public importance.

I therefore request that, complying with the provisions of the act of Congress entitled "An act to expedite the hearing and determination of suits in equity pending or hereafter brought under the act of July 2, 1890, entitled 'An act to protect trade and commerce against unlawful restraints and monopolies,'" approved February 11, 1903, you will file this certificate among the records of the above-entitled cause, and immediately furnish a copy thereof to each of the circuit judges of the first circuit, to the end that said case shall be given precedence over other cases in said court, and be assigned for hearing at the earliest practicable date before not less than three judges of said circuit, as is provided by the said act of February 11, 1903.

GEORGE W. WICKERSHAM,
Attorney General.

WASHINGTON, D. C.

District Court of the United States,

DISTRICT OF MASSACHUSETTS.

IN EQUITY.

No. 301 (C. C. 911).

UNITED STATES OF AMERICA

v.

UNITED SHOE MACHINERY COMPANY, OF NEW JERSEY, ET AL.

EVIDENCE FOR THE UNITED STATES.

TAKEN PURSUANT TO ORDER OF COURT, ENTERED JUNE 27, 1913, BEFORE ME,

CHARLES K. DARLING,
Special Examiner.

BOSTON, MASS., July 14, 1913.

Present:

WILLIAM S. GREGG, Esq., *Assistant to the Attorney General,*
ALLEN WEBSTER, Esq., *Special Assistant to the Attorney General,*
of Counsel for Complainant;
FREDERICK P. FISH, Esq., and CHARLES F. CHOATE, Jr., Esq.,
of Counsel for Defendants.

Pursuant to the order of the court entered June 27, 1913, page 1902 of this record, the taking of testimony with respect to patents was resumed on the date above written, at room 132, Federal Building, Boston, Massachusetts, before Charles K. Darling, Esq., as Special Examiner.

By direction of the examiner and agreement of counsel, the hours of sitting are to be from 10 A. M. to 3.45 P. M. daily.

DEPOSITION OF NELSON W. HOWARD (*recalled*).

Direct Examination by ALLEN WEBSTER, Esq., *of Counsel for Complainant.*

Int. 1208. Mr. Howard, how long have you had charge of the patent department of the United Shoe Machinery Company?

Ans. Since its organization in February, 1899.

Int. 1209. And prior to that time, how were you occupied?

Ans. For some four months before that I was with the Mackay Shoe Machinery Company, and previously to my connection with that company I was for nearly three years in the office of the firm of Fish, Richardson & Storrow, the firm which is now named Fish, Richardson, Herrick & Neave.

Int. 1210. So that you have had how many years experience in patent matters?

Ans. Something over fifteen years.

Int. 1211. And has the larger portion of your time and labors been devoted to patents relating to shoe machinery?

Ans. Yes, sir.

Int. 1212. What are your duties in your employment, as having charge of the patent department of the United Shoe Machinery Company?

Ans. The duties are quite varied. I don't know that I could mention them all without taking considerable time, but in general I have charge of the soliciting of the patents of the company, except the patents on Goodyear machines. I have supervision of the work of my associates in preparing and prosecuting the application for patents; I examine patents and applications that are submitted for purchase, examine our experimental machines to determine whether or not they are free from infringement of patents owned by others, and frequently confer with officials of the company in connection with various patent questions which come up from time to time on matters in connection with which patents are discussed.

Int. 1213. Are you familiar with all the patents owned by the United Company?

Ans. I am more or less familiar with all of them, particularly those patents on machines which are in the departments in which the machines are classified on which I do the patent soliciting.

Int. 1214. You may state what departments you refer to in the last answer.

Ans. I do the patent soliciting on machines in the lasting, heeling, metallic eyeletting and general departments, with a few exceptions.

Int. 1215. Does that take in everything other than the Goodyear departments?

Ans. Practically.

Int. 1216. Are you also familiar with patents owned by the companies affiliated with the United Company?

Ans. I do not recall any to which my previous answer would not apply.

Int. 1217. Then, as I understand you, you think you are familiar with those patents?

Ans. I cannot say that I have them all in mind, but I am certainly more or less familiar with those patents.

Int. 1218. In response to questions by counsel for defence, you have testified with reference to many patents and machines; kindly state whether any of the patents of which you have testified relate to the cutting of soles for shoes.

Ans. May I ask you to define "cutting of soles" a little more clearly?

Int. 1219. Well, I mean cutting out soles for shoes.

Ans. Shaping them?

Int. 1220. No; simply original cutting them out. It may be a sole-cutting or dieing machine, or anything designed to cut the sole out,—the first operation of cutting the soles.

Ans. Certainly; I understand you now. The machine of the Breach Manufacturing Company was a machine particularly intended for cutting soles.

Int. 1221. It is and has been for many years common to cut or die out soles with a die, has it not?

Mr. CHOATE. I think that is rather a leading question, Mr. Webster.

Mr. WEBSTER. I will change it if you want.

Mr. CHOATE. Perhaps, if you will pursue a uniform practice, you will observe my objection to leading.

Mr. WEBSTER. That is a thing that we did not go into first. It was originally brought out before, as I recollect it.

The WITNESS. Shall I answer the question, Mr. Choate?

Mr. CHOATE. I understand Mr. Webster was going to change the form of the question.

Mr. WEBSTER. If you insist on it.

Mr. CHOATE. Yes, I will.

Mr. WEBSTER. I will do it out of courtesy to you.

Int. 1222. What was the old original method of cutting out soles?

Ans. Soles have been died out, and they have been shaped on sole-rounding machines.

Int. 1223. For how long a time, so far as you know, have they been died out?

Ans. I could not undertake to say, without investigating.

Int. 1224. Will you state approximately?

Ans. Well, I should suppose for over twenty years certainly.

Int. 1225. Dieing out a sole is somewhat similar to cutting cookies, isn't it? That is to say, you have a die and press it down through the material to be cut?

Ans. I think I am more impressed by the dissimilarity than by the similarity of the two operations.

Int. 1226. In dieing out a sole, you have a die, the shape of a sole, as I understand it; you place the die on the sole leather, and apply pressure. In that way the sole is cut out. Is that correct?

Ans. Will you kindly read the question?

[*Question read by stenographer.*]

Ans. That is correct, so far as it goes.

Int. 1227. The sole-cutting machines you have testified about in your cross-examination are not what is known as dieing-out machines, are they?

Ans. The machine of the Breach Manufacturing Company was certainly not a machine for forcing a die through a side or a piece of sole leather.

Int. 1228. In your cross-examination, have you testified, so far as you recollect, with reference to lasting machines or patents relating to lasting machines?

Ans. Yes, sir.

Int. 1229. Will you kindly testify what lasting machines or patents you have testified about?

Ans. The patents —

Mr. CHOATE. Does not the record show that, Mr. Webster?

Mr. WEBSTER. It is rather uncertain. I thought we could get it down to a concise statement.

Mr. CHOATE. Well, the record gives the numbers of the patents. That ought to be pretty definite.

Mr. WEBSTER. Of course it refers to a large number of cases. I thought he would have it in mind and it might shorten the record a good deal.

Mr. CHOATE. You can refer to your record, Mr. Howard, to refresh your recollection if you want to.

Mr. HOWARD. I can answer the question. Shall I?

Mr. CHOATE. Yes.

[*Question repeated by stenographer.*]

Ans. I testified in regard to the patents acquired from the Seaver Process Lasting Company.

Int. 1230. If that is a printed copy of the record, will you give the page? What page is that?

Ans. It is mentioned on page 36 of the petition.

Int. 1231. I thought you had a printed copy of the evidence.

Ans. Pardon me. This is the petition [*referring to the printed book before the witness*].

Int. 1232. Do you have in mind what welting machines you have testified about?

Mr. CHOATE. What kind of machines?

Mr. WEBSTER. Welters.

Ans. I testified in regard to the welter of the Globe Sewing

Machine Company and the welter of the Bay State International Shoe Machinery Company.

Int. 1233. I notice on page 623 of the printed record you say in answer to question 637 that "it was believed it would be possible to use a thinner, less substantial and less expensive insole than could be used with the present commercial type of welting machine, that is, a machine having but one thread inside the channel". Will you kindly state what you had reference to in the use of the term "present commercial type of welting machine"?

Ans. I had reference to the United Company's welt and turn machine. Your question reminds me that I also testified about a machine acquired from Rice and La Chappelle, to which your quotation from the record refers.

Int. 1234. Did any of the welting machines to which you made reference in your cross-examination go into use?

Ans. The lockstitch welter of the Globe Sewing Machine Company was used to a limited extent. The welter of the Bay State International Shoe Machinery Company was used to a small extent in England. The welter which we acquired from Rice and La Chappelle was only an experimental machine.

Int. 1235. Then the only welters to which you have testified in your cross-examination that went into use in the United States was the welter you have referred to as the Globe welter, as I understand you?

Ans. You refer now to machines to which I testified?

Int. 1236. Yes.

Ans. I believe that is correct.

Int. 1237. You say that the Globe welter went into use to a limited extent. Will you kindly explain what you mean by "a limited extent"?

Ans. I mean that a comparatively small number were used. I don't know the exact number, but it may have been thirty or forty.

Int. 1238. Will you kindly state the period of time when the Globe welter was in use?

Ans. I believe it was in use for several years preceding the purchase of the Globe Company's patents by the United Company.

Int. 1239. And did it go out of use after the purchase?

Ans. The demand for lockstitch welters ceased entirely within a year or two after the acquisition of the Globe Company's patents by the United Company, as it was found that a lockstitch was unsatisfactory for the inseam.

Int. 1240. As I recollect, you, on cross-examination, testified that patents were acquired by the United Company at the time of the purchase of the Globe and Bay State and Rice and Chappelle properties. Will you kindly state whether any of those patents related to the construction of what you refer to when you speak of the "present commercial type of welting machine"?

[*At the request of Mr. Choate the question was repeated by the stenographer.*]

Ans. I think that question is not very clear, Mr. Webster.

Mr. WEBSTER. If you will state in what respects you do not understand it, I will endeavor to explain.

The WITNESS [*to the stenographer*]. Will you read it?

[*Question repeated by stenographer.*]

The WITNESS. Perhaps I can explain my difficulty best by inquiring whether you mean to inquire whether any inventions of those patents are embodied in the present commercial machines?

Mr. WEBSTER. You may answer it in that way if you wish.

The WITNESS. That is what the question means, then?

Mr. WEBSTER. Not necessarily, but if you wish you may answer it giving the question that interpretation.

The WITNESS. The question is limited to welting machines, and it does not include outsole stitchers?

Mr. WEBSTER. The present question is limited to welting machines, — of the type referred to by you as the present commercial welting machine. [*To* Mr. FISH:] It may be that you would stipulate upon some of these points.

Mr. FISH. I would stipulate on most anything this warm weather.

Mr. WEBSTER. I want you to tell us what patents you have on the welter. You are going to tell us I presume before you get through.

Mr. FISH. Do you mean on all other machines, too?

Mr. WEBSTER. Oh, no; we don't need to go into any labyrinth.

Mr. FISH. If you will make a memorandum of just what you want, Mr. Choate and I will talk it over.

Mr. WEBSTER. If we have time enough and work hard enough, we can find out what patents you have on the welter. You know what you have and sooner or later you are going to tell us, and it might save time for the parties, the counsel and the court to let us know right now.

The WITNESS. Are you ready for me?

Mr. WEBSTER. I am, yes.

The WITNESS. The welter of the Globe Sewing Machine Company, — the lockstitch welter of the Globe Sewing Machine Company, — was covered by no patents so far as I recollect, on inventions now in commercial use, the reason being as I have explained that the demand for a lockstitch welter ceased shortly after the acquisition of the Globe Company's patents. If the demand for lockstitch welters had continued, I have no doubt that a machine incorporating many and possibly all of the features of the Globe machine would have been put out by the United Company. The Globe machine was superior to the lockstitch welter which we were just putting out at that time, because the shuttle thread was laid in the channel instead of on the welt as was the case in the machine which we were putting out. It was therefore possible in the use of the Globe machine to use a shuttle thread much larger than the needle thread which was in the operation of the Globe machine laid in the channel and pulled only slightly into the stock. This was a far better method of sewing welts by a lockstitch, because when the shuttle thread was laid on the welt there was much greater liability of cutting through the "between substance", so called, and damaging it. That machine also had a marked feature of superiority —

Int. 1241. You are referring now to the Globe machine?

Ans. I am speaking now of the Globe machine, the Globe lockstitch welter. That machine also had a marked superiority over the lockstitch welter which the United Company had just begun to put out —

Mr. CHOATE. Speaking now as of the time of the purchase?

The WITNESS. Certainly.

Int. 1242. Insert the date right in there, if you can.

Ans. I think it was February, 1901.

Mr. CHOATE. Yes.

[*Ans. continued:*] That machine also had a marked superiority over the lockstitch welter which the United Company had just begun to put out in that the welt support carrying the welt guide was movable about the same axis of oscillation as the needle and awl. So that there was assurance that the welt would always be presented in such location with reference to the work that the needle would enter the groove in the welt. These two features of superiority, together with others of less striking importance, would undoubtedly have been adopted in the United Company's lockstitch welting machine had it not been for the fact that shortly after the acquisition of the Globe Company's patents shoe manufacturers decided that they did not desire to sew the inseam by a lockstitch, and they refused to use lockstitch welters. In the year ending March 1, 1902, we put out only nine lockstitch welters, and six were returned; in the year ending March 1, 1904, we did not put out any machines, and five were returned. By "any machines" I mean of course lockstitch welting machines.

Int. 1243. Of the Globe type?

Ans. Of any type.

Int. 1244. And were those you put out of the Globe type?

Ans. The ones to which I have just referred, in stating the output and return, were machines known as Universal inseam sewing machines, that is, the United Company's commercial lockstitch welting machines. Referring now to the welter of the Bay State International Shoe Machinery Company —

Int. 1245. I beg your pardon. The question did not go into that. As I recollect, you said none of those went into use in the the United States.

Ans. Very well. Passing then to the machine acquired from —

Mr. CHOATE. Wait a moment. The question was, whether any

of these patents were involved or used in the present commercial type of welter. That is what you are answering?

Mr. WEBSTER. You are right. I should suppose he could answer the question briefly without going into all this detailed explanation.

Int. 1246. If you can do so, I suggest that the rest of your answer you answer briefly instead of trying to analyze.

Ans. The welt-sewing machine of the Bay State International Shoe Machinery Company, as it was put out in England, was a large — was a very unsatisfactory machine as compared with the welter then being put out by the United Shoe Machinery Company. The Bay State machine embodied a series of efforts to avoid patents owned by the United Company. In the machine representing the final stage of these efforts, the stitch was set by the needle through the —

Mr. CHOATE. May I interrupt you just a moment? Did you notice that the question is whether any of these patents which you have named are involved in the present commercial machine as you have defined it?

The WITNESS. I have that in mind, and I am endeavoring to explain why the inventions of these patents were not embodied in our machines.

Mr. CHOATE. I do not know whether you want to know that or not.

Mr. WEBSTER. I have suggested before that he might come to the point of answering more briefly rather than analyze the machine.

Mr. CHOATE. If none of them were, answer it no and we will take it up in recross-examination.

Ans. Then I will answer, as to the welting machine of the Bay State International Shoe Machinery Company, that so far as I know no patented inventions incorporated in that machine are embodied in the present commercial welting machine of the United Company.

Mr. CHOATE. You mean by "present commercial welting machine" the one being put out today?

The WITNESS. I think when I answered the question to which Mr. Webster directed my attention I meant the machine which was

being put out at the time of the Rice and La Chappelle acquisition, but I am now answering as of the present day. As to the machine acquired from Rice and La Chappelle, as I have previously testified, that machine has been experimented with by inventors of the United Company, but it has not yet been conclusively determined that the extra thread called for by the patents on that machine will be of commercial advantage, and the invention has not as yet been adopted by the United Company.

Int. 1247. I think, Mr. Howard, if you will kindly explain to the court just what you mean by "commercial machine" it may save considerable time, and for the purpose of saving time for the court and the parties, I will ask you to kindly examine the cut of a welting machine as illustrated in the catalogue of the United Shoe Machinery Company, and ask you to state whether that properly illustrates the present commercial type of welting machine of the United Company? Do you know where to find it?

Ans. That catalogue is some eight or ten years old, is it not, Mr. Webster?

Int. 1248. I don't know. You know. You had a cut of one of your last illustrations.

Ans. I think there is an index to that catalogue.

Int. 1249. At which end?

Ans. At the back end, I think.

Int. 1250. [*Counsel hands book to witness.*] That is page 6, isn't it, Mr. Howard?

Ans. Yes. [*Witness examines cut.*] The cut in this catalogue shows the Goodyear welt and turn shoe machine, which was superceded by welt and turn shoe machine Model G and again by welt and turn shoe machine Model K.

Int. 1251. Kindly state when Model G was first put in.

Ans. I don't know that I can state exactly without looking it up, but it was put out about 1907.

Int. 1252. When was Model K first put out, so far as you know?

Ans. I believe Model K was put out late in 1910 or early in 1911.

Int. 1253. Will you kindly examine the records and testify at some subsequent hearing as to the exact dates so far as possible?

Ans. I should be glad to.

Int. 1254. Kindly state for how long a period, so far as you know, the welter illustrated on page 6 of the United catalogue, to which illustration you have made reference in your previous answers, was in use.

Ans. I am afraid my recollection is too vague to venture a statement about that, Mr. Webster. I will be glad to look it up.

Int. 1255. State as nearly as you can recollect at the present time, and then you can look it up later, if you will, kindly.

Ans. I think it was in use for some eight or ten years.

Mr. CHOATE. Model F?

The WITNESS. That is a machine without a model name, — Goodyear welt and turn shoe machine.

Mr. WEBSTER. Mr. Choate, will you furnish us a catalogue like this so that we may put it in evidence?

The WITNESS. I think I can get one.

Mr. WEBSTER. For the present, I should like to have this marked for identification, and then put in one.

Mr. CHOATE. You mean the present catalogue? You mean another one like that?

Mr. WEBSTER. Yes.

The EXAMINER. Government Exhibit 190 for identification. That is the catalogue of what year?

Int. 1256. What year was this issued, if you know, Mr. Howard?

Ans. About 1902 or 1903, I think.

Int. 1257. Can you ascertain; and, if so, will you?

Ans. I will.

Int. 1258. And give us the date. Then, as I understand you, according to your recollection, the type of welter shown in the cut to which you have made reference was the commercial welter of the United Company for a period of ten years?

Ans. Approximately, so far as I can now recall.

Int. 1259. Can you state how many welters like the one illustrated in the cut referred to were put out by the United Company during the ten-year period?

Ans. Not without looking it up.

Int. 1260. Can you state approximately?

Ans. I should hardly venture to. I have had no occasion to know.

Int. 1261. Will you look it up and give us the date the next session?

Mr. CHOATE. The question is, how many?

Mr. WEBSTER. About how many; whether it is one hundred, a thousand, a million or ten million.

Mr. CHOATE. How is that question opened by anything asked in cross?

Mr. WEBSTER. It seems to me it is. I do not know.

Mr. CHOATE. I do not see how it is, and I should like to object to it, as very plainly the burden of looking up statistics is a tremendous one, even if Mr. Howard didn't have to testify. I do not want to have him loaded with looking up a lot of things if it is not material.

Mr. WEBSTER. Why don't you tell us?

Mr. CHOATE. It does not come in his department.

The EXAMINER. All we can do is to note the objection on the record.

Mr. CHOATE. I think I will suggest to Mr. Howard that he do not look it up.

Int. 1262. Will you kindly state what patents of the defendants were made upon the welting machine illustrated on page 6 of the catalogue?

Mr. CHOATE. To that question I object as not opened by any cross-examination.

Mr. WEBSTER. That is one of the questions, I suppose, we will have to leave for the court to pass upon later.

Int. 1263. Kindly state how the welting machine referred to by you as Model G differed from the welting machine illustrated on page 6 of the catalogue.

Mr. CHOATE. I make the same objection.

Int. 1264. Please state how the welting machine referred to by you as Model K differed from the welting machine illustrated on page 6 of the catalogue.

Mr. CHOATE. The same objection.

Int. 1265. Your answer with reference to the Globe welter was somewhat confused, as it seems to me, and, for the convenience of the court, will you kindly state briefly whether any of the Globe welters were manufactured and put out by the defendant company?

The EXAMINER. Before that question is answered, might it be made perfectly clear? Mr. Choate instructed the witness not to answer those questions which were objected to. It might appear from the record they were withdrawn. Ordinarily a question, although objected to, is answered; but if counsel directs the witness not to answer them, of course he does not.

Mr. CHOATE. I assume we have that right under the concluding cause of the order: "The Court reserves control of the proceedings before the examiner. So far as either party finds it necessary to protect their rights upon any question as to the admission of proof, either party may apply to the Court."

The EXAMINER. There will probably be questions to which you do object which may be answered?

Mr. CHOATE. Possibly.

Mr. WEBSTER. Counsel for the United States reserves the right to submit the questions objected to to the court so that the witness may be instructed as to whether they should be answered or not.

Mr. CHOATE. Why don't you conclude your re-examination, and then, if you believe it necessary to call him on these questions, I suppose you have a perfect right to do so?

Mr. WEBSTER. I suppose so, but I would like to group the whole business.

[*Question read by the stenographer as follows:*]

"Your answer with reference to the Globe welter was somewhat confused as it seems to me, and, for the convenience of the court, will you kindly state briefly whether any of the Globe welters were manufactured and put out by the defendant company?"

Ans. As I stated, the demand for lockstitch welters entirely ceased after this acquisition, and very few, if any, Globe welters were put out.

Int. 1266. Then, as I understand you, so far as you know, none

of the Globe welters were put out by the defendant company. Is that correct?

Ans. I cannot state now whether any were put out.

Int. 1267. But, so far as you know, none were?

Ans. I think I have answered that question.

Int. 1268. Will you kindly look that up and answer?

Ans. I might need more than a day for this.

Int. 1269. The question is, will you look it up?

Ans. It may involve the time of half a dozen clerks for several days possibly.

Int. 1270. You have not answered the question now.

Ans. Certainly.

Int. 1271. I notice in your cross-examination reference has been made to sole-laying machines, sole-beating machines, sole-leveling machines and sole-pressing machines. Will you kindly state whether these four machines differed materially in construction or whether those are different names of the same machine?

Ans. I was not aware that I had used all of those expressions, except possibly in quoting the titles of patents. I shall be glad, however, to explain that the term "sole-laying machine" is used in the trade as meaning a machine for pressing on the sole of a shoe, — the outsole, — and securing it temporarily to the shoe by cement, while the term "leveling machine" is a generic term including numerous types of machines for imparting to the sole by pressure, after the sole has been permanently attached, the shape which it is desired that the sole shall have in the finished shoe.

Int. 1272. Then, does the sole leveling include sole beating and sole pressing?

Ans. The term "sole beating" is sometimes used to designate leveling machines. I am not aware that the expression "sole pressing" is used in the trade.

Int. 1273. In your cross-examination you made reference to the Cutcheon patent, which patent I think you stated had been extensively litigated. Kindly state whether the Cutcheon patent to which you made reference is No. 384,893, beating-out machine, patented June 19, 1898, a copy of which patent I hand you for inspection.

Ans. Yes, sir.

Mr. WEBSTER. A copy of patent to J. C. Cutcheon, beating-out machine, dated June 19, 1898, No. 384,893, offered in evidence, is marked "Plaintiff's Exhibit 191".

Int. 1274. Kindly state whether at the time of purchase from the American Sole Laying Company of these properties, any suits, so far as you know, were pending between the United Company and the then owner of the Cutcheon patent.

Ans. Under the Cutcheon patents?

Int. 1275. Owner of the Cutcheon patents?

Ans. Yes. Suits under the Cutcheon patents?

Int. 1276. Yes.

Ans. I do not recall that at that time the United Company was a defendant in a suit on the Cutcheon patent.

Int. 1277. You say in your answer, page 524 of the typewritten record [printed page 699]: "That patent [*referring to the Cutcheon patent*] had been sustained by the Court of Appeals, and manufacturers had been forced to pay heavy damages for the infringement of the patent." Kindly state what suits you had reference to in making that answer.

Ans. The large number of suits had been brought by the Tripp-Giant Leveller Company, the owners of that patent, against users of machines made and put out by the Bresnahan concern, of which I think the name was M. V. Bresnahan & Company. As I stated in my previous testimony, the patent had been sustained by the Court of Appeals in one or more of those suits, and the Bresnahan concern and a large number of shoe manufacturers who had used the Bresnahan machine were forced to pay heavy damages on account of their infringement of that patent.

Int. 1278. In making your last answer, do you state facts of your own personal knowledge, or do you rely on statements made by others?

Ans. I did not have cognizance of these suits at the time they were brought, but I believe the facts to which I refer are largely, if not entirely, of record in this court.

Int. 1279. Have you examined the record?

Ans. No, sir.

Int. 1280. Then, with reference to these facts you are testifying from hearsay, are you not?

Ans. Perhaps I may say that I am entirely confident that the facts are as I have stated.

Mr. WEBSTER. The answer objected to as not responsive.

Int. 1281. I call your attention to the fact that the contract of transfer from the Bresnahan Company is dated December 10, 1910, while the Cutcheon patent to which you have testified expired in 1905. Will you kindly explain to the court how the purchase of a right under that patent after its expiration was important at the time of purchase so made?

Ans. I do not recall that I mentioned the Cutcheon patent in connection with the transaction which the United Company had with M. V. Bresnahan & Company in 1910. In testifying about the acquisition of the patents of the American Sole Laying Machine Company in 1902, I testified that the United Company desired to make a two-form machine out of the machine of the — out of the sole-laying machine which it had previously acquired from the Boot and Shoe Sole Laying Machine Company, but could not do this because a two-formed sole-laying machine of that type would infringe this Cutcheon patent; and I further explained that the American Company had a license under the Cutcheon patent 384,893, which license the United Company acquired from the American Company, so that it was then enabled to put out a two-form sole-laying machine of the — so that it was then able to transform the sole-laying machine which it was then putting out of the single type into a two-form machine which had double the capacity of the single type machine.

Int. 1282. Did the United Company to your knowledge manufacture and put out beating-out machines constructed as set forth in the Cutcheon patent 384,893?

Ans. After the acquisition of the American Sole Laying Machine Company and the license which that company had under the Cutcheon patent, the United Company put out two-form sole-laying machines, and they also put out two-form leveling machines, both of

which machines were covered by claim 1 of the Cutcheon patent in question.

Int. 1283. You perhaps did not understand the question. The question was: Did the United Company put out machines constructed as shown in the Cutcheon patent 384,893?

Ans. If I recall correctly, the license acquired from the American Company was limited to sole-laying machines, in which case, of course, the United Company had no right to put out leveling machines, — put out the leveling machine shown and described in the Cutcheon patent. It did not, so far as I am aware, put out (at least for some years) a machine like that shown in the Cutcheon patent.

Mr. CHOATE. You say the license was limited to sole laying?

The WITNESS. That is my recollection. I have not a copy of the license, but my notes would indicate that the license was limited to sole-laying machines.

Int. 1284. Pardon me, but I do not understand that you have answered the question. I will put it in this form: Did the United Company, to your knowledge, ever put out a machine constructed as shown in the Cutcheon patent 384,893?

Mr. CHOATE. I should like my objection noted to that question as immaterial and not opened by anything on cross-examination.

Ans. I have stated that the United Company put out machines embodying the invention covered by that patent. I am not aware that it has ever put out a machine identically like the machine shown in the drawings of the patent.

[*Adjourned to 10 A. M., Tuesday, July 15, 1913.*]

BOSTON, MASS., July 15, 1913.

Direct Examination by WILLIAM S. GREGG, Esq., *of Counsel for Complainant.*

Int. 1285. Mr. Howard, did you find that eyeletting agreement of 1897? You will remember I asked for it in connection with the Boston Fast Color Eyelet Company.

Ans. I could not find that, Mr. Gregg.

Int. 1286. You made a search for it?

Ans. Yes. It is an old instrument, you will recollect. The United Company was not a party to it. It was executed before 1899.

Int. 1287. I understand that, but it was a part of the agreement with the Boston Fast Color Eyelet Company. You made a search for it and could not find it?

Ans. I made a search for it and could not find it. It was not in the files where it would have been if we had had it.

Int. 1288. Did you make inquiries of anyone else about it?

Ans. I inquired of the clerk who had charge of the documents, and she could not remember such a document.

Direct Examination by ALLEN WEBSTER, Esq., *of Counsel for Complainant.*

Int. 1289. Did you bring in that catalogue?

Ans. Yes, Mr. Webster.

[*Passes to Mr. Webster "Illustrated Catalogue of Shoe Machinery Manufactured by the United Shoe Machinery Company."*]

Int. 1290. Do you give it to us?

Ans. Certainly, if you wish it.

Int. 1291. I want to multilate it.

Mr. WEBSTER. Counsel for defendant having kindly produced a copy of the catalogue of the United Shoe Machinery Company similar to the one marked for identification yesterday, counsel for the United States offers in evidence the cut on page 6 of said catalogue and the printed matter on page 7, said cut being entitled "Goodyear welt and turn shoe machine", the printed matter reading as follows:—

"This machine sews the welt on the shoe, fastening together with a chain stitch the welt, upper and insole. It practically duplicates the work of the hand welt sewer. This machine is immensely popular, and its use is constantly increasing. It has been improved and developed to the point of perfection. It measures the thread to the needle perfectly, thereby preventing all abrasion to the thread. After the needle has drawn the loop through the work and has returned again through the stock, the take-up tightens the stitch by pulling on the supply end of the thread while the needle firmly supports the leather between stitches against the sawing action or the thread. This is the only method yet discovered for

tightening the chain stitch without destroying the between substance. The chain and the stitch is placed on the outside of the welt or in the case of a turn shoe on the outside of the lining of the upper (before turning). This method of forming and tightening stitches gives a perfect result such as can be obtained in no other way."

I suppose it is unnecessary, Mr. Choate, to read the matter in small type.

Mr. CHOATE. I will ask the examiner to note the defendants' objection to this evidence as immaterial, irrelevant and inadmissible, and not opened by anything developed in the cross-examination.

[*Illustrated catalogue of shoe machinery manufactured by the United Shoe Machinery Company marked "Plaintiff's Exhibit 190".*]

Mr. CHOATE. I understand it is that cut and that reading matter which constitutes the exhibit?

The EXAMINER. Yes.

Int. 1292. When did the United Company put out the catalogue referred to in the last question?

Ans. About May 1st, 1902.

Int. 1293. And for how long a time did the United Company put out welting machines constructed as illustrated in the Exhibit 190?

Ans. The United Company continued to put out that machine for some years. As I stated yesterday, it was later superseded by Model G.

Int. 1294. Kindly state, as near as you are able, for how many years the United Company put out machines as illustrated in the Exhibit 190.

Ans. Excepting the small number of lockstitch welters which were put out, and excepting the Model E machines which were being put out, or which were put out at about the time this catalogue was issued, the machine shown in the exhibit was the regular commercial machine of the United Company until the adoption of the Model G, which was in 1908.

Mr. CHOATE. Wasn't it Model F?

The WITNESS. Model G.

Mr. CHOATE. Was there any hiatus between Models E and G?

The WITNESS. I don't know that there was.

Int. 1295. In the cross-examination you made reference to the patent referred to by you, as I recollect it, as the Briggs patent.

Mr. CHOATE. Where did he refer to that, Mr. Webster?

Mr. WEBSTER. I don't know where, but he did.

Int. 1296. Will you kindly—

Mr. CHOATE. I think that we better be exact about that.

Mr. WEBSTER. Do you doubt it?

Mr. CHOATE. No.

Mr. WEBSTER. The reference is on page 707 of the printed record.

Int. 1297. In the cross-examination you made reference to the patent referred to by you, as I recollect it, as the Briggs patent, the Briggs method. Kindly give the number, date and title of the Briggs patent referred to by you.

Ans. The Briggs patent to which I referred was No. 461,793, granted October 20, 1891.

Int. 1298. You may give the title.

Ans. "Method of Forming Chain Stitches."

Int. 1299. Did the Briggs patent No. 461,793 become the property of the United Company?

Ans. Yes, sir.

Int. 1300. Who was the owner of the Briggs patent at the time that suit was brought against the Globe Sewing Machine Company?

Ans. I have not the date of the suit before me, but recall that it was brought in the name of the Goodyear Shoe Machinery Company. That may have been, however, after the United Company was formed and before the patent had been formally assigned to the United Company.

Int. 1301. Did the United Company have any machines which carried out the Briggs method?

Ans. Yes, sir.

Int. 1302. What machines?

Mr. CHOATE. Wait a moment. I don't see how that was opened under anything in the cross-examination; do you?

Mr. WEBSTER. Well, I think it is.

Mr. CHOATE. Won't you point out what?

Mr. WEBSTER. It goes to the general subject-matter testified to by the witness.

Mr. CHOATE. He did not testify at all as to the machines which the company had, in this respect. He said the Globe Sewing Machine Company was in litigation, and that they were sued under this patent. That clearly had no connection with the machines which the United Company might have been making under that patent. You will note that our objection was to Mr. Howard's being examined in chief during the course of your redirect. It is going to save us both trouble and time if you will finish your redirect before you begin in this matter.

Mr. WEBSTER. It seems to me it will be easier for the court if we could get it all under one heading, rather than to spread it in different parts of the record.

Mr. CHOATE. Well, I don't think it would be. It would not, from our point of view, and I think we shall have to insist on our right there, that you shall finish your redirect.

Mr. WEBSTER. I don't think we are compelled to do that. I don't understand that the witness objects.

Mr. CHOATE. Well, I shall have to instruct the witness not to answer any questions which it seems to us are outside the legitimate scope of this examination.

Mr. WEBSTER. Then, as I understand you, you do instruct the witness not to answer?

Mr. CHOATE. Yes; I think this is not legitimate redirect.

Mr. WEBSTER. Then I suppose the witness ought to enter upon the record that, by instruction, he declines to answer?

Mr. CHOATE. Yes.

The WITNESS. By advice of counsel, I decline to answer.

Int. 1303. Referring now to the acquisition from Stanbon, referred to in Government Exhibit 145, you say the device was

commercially successful. Will you kindly state what you mean by the term "commercially"?

Mr. CHOATE. Will you state the number of the question you are quoting?

Mr. WEBSTER. This is on page 608.

Mr. CHOATE. Is not the question numbered?

Mr. WEBSTER. The first question I called his attention, where the acquisition is referred to, is 557. The particular question referred to where the words "commercially successful" are used in the interrogatory, where he adopted it, is 560.

Mr. CHOATE. Your question now is what?

[*Question read by the stenographer.*]

Mr. CHOATE. I think I used the term "commercially successful" in my question.

Mr. WEBSTER. Yes, but he adopted it. He says: "Yes; we had been using this thing ourselves prior to the declaration of interference."

Mr. CHOATE. All right. I don't care.

Mr. WEBSTER. I will change it if you prefer.

[*Question read by the stenographer.*]

Ans. In this instance, I meant that manufacturers had found that this device would perform the work for which it was intended very advantageously and rapidly and that the device had gone into extensive use in shoe factories.

Int. 1304. In answer to question 560, page 509 of the printed record, you refer to an interference. Kindly state whether a patent issued upon any of the applications involved in that interference; and, if so, give the number and date of the patent.

Ans. Upon the Stanbon application, serial No. 195,598, filed February 27, 1904, there was issued patent No. 1,004,705, granted October 3, 1911, for channel-cementing machine.

Int. 1305. And was that patent issued to the United Company?

Ans. Yes, sir.

Int. 1306. Was any other patent involved in that interference issued?

Ans. I believe that the application on which was granted patent

1,030,623, granted June 25, 1912, F. H. Warren, was also involved in the interference. I do not recall now, but can ascertain if desired, whether other applications involved in these interferences have matured into patents.

Int. 1307. I would appreciate it if you would kindly do so.

Ans. I would be glad to.

Int. 1308. Kindly state how many interferences were pending.

Ans. There were several. The exact number I cannot state from memory, but shall be glad to ascertain if desired.

Int. 1309. Please do so. In referring to the acquisition of the Booth perforator, you say, in answer to question 572, page 610 of the printed record: "Not under the circumstances that I refer to." Will you kindly explain what you mean by that answer?

Ans. I had reference by that answer to the special work for which the Stanbon perforating machine is adapted, as indicated in my answers to questions 564, 565 and 566.

Int. 1310. Your explanation does not seem clear to me. Will you kindly state under what circumstances the ornamentation of the two machines was different so as to avoid the necessity of referring to other questions and answers to ascertain your meaning?

Ans. The ornamentations of the two machines were different, when the Stanbon machine was adapted for doing embossing work rather than perforating; that is, when it was used with a heated tool for impressing the ornamentation in the upper stock rather than perforating it.

Int. 1311. And was the Stanbon machine adapted also to do the same class of work as the other machine to which you have referred?

Ans. These two machines have distinct fields owing to radical differences in their organizations. The machine acquired from the Booth Company is a punch feed machine and is far more accurate on curved work. The fact that it is a punch feed machine limits its range of work to that in which the spacing does not exceed a maximum of fifteen thirty-seconds of an inch. The Stanbon machine on the other hand is very much faster and therefore is better

adapted for substantially straight-edge work, and as the work operated upon in it is fed by a feed wheel it is has unlimited capacity as to spacing. I have in my hand a sample of work in which the spacing is one and one-eighth inch, which is more than double the maximum spacing permissible on the Booth perforator. This sample of work was done on the Stanbon machine.

[*Piece of leather with perforations produced by Stanbon machine marked "Defendants' Exhibit 100".*]

Int. 1312. Referring further to the acquisition from Stanbon, you say in answer to cross-question 574: "We haven't got it quite commercial yet", referring to the folding machine. Kindly state what you mean by "we".

Ans. The United Shoe Machinery Company.

Int. 1313. Well, do you mean the officers, managers, mechanics, or yourself, in using the term "we"?

Ans. Those who are engaged in developing and perfecting this machine or the inventors who are working upon it, the machinists and road men who are assisting them, and the experimental committee who are supervising and directing their work.

Int. 1314. In the same answer you say: "We think we have got it pretty nearly right now." Do you mean by that phraseology that you are testifying to what others have told you about it?

Ans. That opinion was based upon my personal knowledge of the machine, assisted of course by the views of experts.

Int. 1315. In answer to question 576, which was "not developed commercially" you say: "No, we have not put anything out, and that was a long way from a commercial machine when we took it." Do you mean by the words "not developed commercially", as understood by you, that the machine was not operative at that time?

Ans. No, sir; I did not mean that.

Int. 1316. In answer to question 578, you say: "I think all the machines are covered by patents." Will you kindly give a list of the patents referred to by you in that answer?

Ans. 640,426, January 2, 1900, —

Int. 1317. If you have the title there, put that right in.

Ans. On the list that I am referring to, there is a title given which I think is the title of the patent. It would take some little time to look at each copy of the patent.

Int. 1318. I am content that you should take the title as you have it in your record.

Ans. 640,426, granted January 2, 1900, leather punching machine; 955,711, granted April 19, 1910, leather punching machine; 607,140, granted July 12, 1898, channeling machine; 663,050, granted December 4, 1900, channeling machine; 607,139, granted July 12, 1898, channel flap turning machine; 898,016, granted September 8, 1908, channel flap turning machine; 1,004,705, granted October 3, 1911, channel-cementing machine; application serial No. 427,638, filed April 11, 1908, folding machine; application serial No. 508,723, filed September 6, 1910, machine for folding pliable material.

Int. 1319. Is that all? Is that your answer?

Ans. These are the patents acquired from Stanbon which covered his machines.

Int. 1320. Kindly state whether the applications referred to in your last answer have since merged into patents.

Ans. No, sir; they are still pending.

Int. 1321. Kindly explain to the court what you mean by the use of the term "covered" as employed in your last answer but one.

Ans. I mean that the inventions claimed in the patents and applications which I named are embodied in the machines which we acquired from Stanbon.

Int. 1322. In your answer to the question 582, page 611, you make reference to a large number of suits, this being in connection with the purchase from M. V. Bresnahan & Company. Your answer apparently is responsive to the question as to whether there had been a large number of suits brought by one side or the other. Kindly state what company you have reference to as parties to the litigation other than the Bresnahan Company.

Ans. I had reference to suits between Bresnahan, or concerns in which he had been interested, and the United Shoe Machinery Company.

Int. 1323. Will you kindly give the names of the concerns you refer to in your last answer, other than M. V. Bresnahan & Company?

Ans. I believe that Mr. Bresnahan had done business under the name of Bresnahan Shoe Machinery Company, and also I believe under the name of M. V. Bresnahan & Company. I think he may have done business also under the name Maurice V. Bresnahan.

Int. 1324. Are you testifying, with reference to the suits referred to and the settlements made, from your own personal knowledge, or because of what you have learned from others?

Ans. I have had personal knowledge of much of this litigation, — probably all of it.

Int. 1325. Are you sufficiently familiar with the litigation referred to so that you can give the names of the cases and the patents involved?

Ans. I can give information at this time about some of the suits for infringement of patents, although there were also other suits. Those which I recall are Equity No. 1772, United Shoe Machinery Company *v.* Bresnahan Shoe Machinery Company —

Int. 1326. If you have a record there of when the bill was filed, kindly state it.

Ans. The bill filed August 17, 1903, — and Equity No. 286, Maurice V. Bresnahan *v.* United Shoe Machinery Company, bill filed August 9, 1906.

Int. 1327. In referring to the acquisition of property from Bresnahan, you, in answer to cross-question 591, page 612, referring, as I understand it, to the burnishing machine, say: "An application was pending upon it." Kindly state whether the application has merged into a patent as yet; and, if so, give the number, date and title.

Ans. The patent has not yet been granted upon that application.

Int. 1328. Referring to the application of the Prenzel improvements, you say, in answer to question 595, page 612: "Yes. Patents had been granted." Will you kindly give the number, date and title of the patents referred to in that answer?

Ans. The question and the answer apparently relate to the

underwedge shoe, a process of making the shoe which we acquired — which the United Company acquired from Prenzel. The patent on the shoe was No. 967,053, granted October 9, 1910, which was reissued as No. 13,448 on July 23, 1912. The patent on the process of making this shoe was No. 960,234, granted May 31, 1910, which was also reissued as No. 13,447 on July 23, 1912. This process was also covered by patent No. 1,050,040, granted January 7, 1913. Although this question and answer do not refer to the machines for making the shoe, but to the patents on the Cack shoe, the process of making it and the machine for making it, I can state the data of those patents, if you desire.

Int. 1329. Please do so.

Ans. The various machines used by Prenzel in the manufacture of the underwedge shoe were covered by the following patents: 959,256, granted May 24, 1910; 965,744, granted July 26, 1910; 965,656, granted July 26, 1910, which was reissued as No. 13,375 on February 27, 1912. The Cack shoe was covered by an application which was pending at the time of the Prenzel acquisition, upon which was later granted patent 1,031,196, granted July 2, 1912.

Int. 1330. Did you give the title there?

Ans. "Shoe." The process of making the Cack shoe was likewise covered by a pending application, upon which was granted, on June 25, 1912, patent No. 1,030,609. The machine used in making the Cack shoe was covered by a pending application at that time, upon which was granted, on June 25, 1912, patent No. 1,030,608.

Int. 1331. Now, for the convenience of the court, will you kindly briefly explain the difference between the Prenzel shoe and the plain ordinary shoe that has been in use for twenty years?

Mr. CHOATE. He has fully described that in his examination, and we used exhibits to demonstrate it.

Mr. WEBSTER. My recollection is that it was quite extended. I should suppose he could state it in a very few words.

Int. 1332. Couldn't you state it very briefly, the principal points of difference; in other words, is it what is known as a freak shoe, or is it a common everyday shoe?

Ans. Perhaps I can refer to the patent in such a way as to be clear —

Int. 1333. I would prefer that you would not refer to the patent. I would like to have it clear in a brief, plain statement so that a layman could understand the difference.

Ans. I think I will need the exhibits, Mr. Webster.

Int. 1334. While waiting for the exhibits, I will ask you this question: Is the Prenzel shoe a shoe which has gone into extensive use?

Ans. The shoe, — the underwedge shoe, — invented by Prenzel has been manufactured in considerable numbers since the Prenzel acquisition.

Int. 1335. Who makes the Prenzel shoe?

Ans. Prenzel himself has made the shoe, and it has been made by several others. The expectations which were entertained at the time of the acquisition —

Int. 1336. Pardon me. I wish you would answer the question without going into explanation of expectations.

Ans. I have answered it.

Int. 1337. Can you give the name of any individual, copartnership or corporation other than Prenzel that are now manufacturing the Prenzel shoe?

Ans. I cannot from memory.

Int. 1338. Can you give the name of any party who has made it other than Prenzel?

Ans. The only one which I recall now is the concern which I believe is known as the Curtis & Jones Company.

Int. 1339. In referring to the acquisition from the Sturtevant Company, you said, as I understand you, that prior to the purchase from the Sturtevant Company the United Company bought its peg wood from others. (This matter is referred to on page 613, Cross-Interrogatory 605.) Kindly state, if you know, from whom the United Company bought peg wood prior to the time of the purchase from the Sturtevant Company.

Ans. I cannot name the concerns without looking them up.

Int. 1340. If you can look them up without inconvenience, will you kindly do so and give us the data later?

Ans. That is necessary, is it, Mr. Webster? That involves quite a little work.

Int. 1341. Can't you ascertain by inquiry? I won't ask you to go to the records.

Ans. If you are willing for me to take statements by others without examining the books, I should be glad to.

Int. 1342. In this matter; yes. In referring to the acquisition of the Wentworth Company property, you say, as I understand you, in answer to cross-question 615, found on page 614, that the shank-sticking machine and the heel-beating machine were patented. Will you kindly give the number, date and title of the patents referred to in that answer?

Ans. The shank-sticking machine was covered by patent No. 929,178, granted July 27, 1909.

Int. 1343. What is the title?

Ans. "Cement Heating and Distributing Apparatus." On the Wentworth heel seat forming machine —

Int. 1344. It is referred to here as "heel-beating machine". That means the same, does it?

Ans. —as I believe the beating machine was known commercially, were the following patents: No. 854,320, granted May 21, 1907; heel seat forming machine, No. 876,249, granted January 7, 1908; shoe ironer — that last patent should not be included; that was not commercial — No. 896,873, granted August 25, 1908; heel seat forming machine inventions which were embodied in most but not all of these machines, were covered by No. 844,293, granted February 12, 1907, 1,010,550, granted December 5, 1911, upon an application which was pending at the date of the acquisition of the Wentworth Company patent.

Int. 1345. Then it is your understanding that the term as used in the question "heel-beating machine" means the same as "heel seat forming machine". Is that correct?

Ans. These terms refer to the same machine which was known by various names during the period preceding the acquisition of the Wentworth patent.

Int. 1346. The term "heel beating" would appear to indicate

that the operation performed by the machine was on the heel, while "heel seat forming" seems to indicate that the operation was on the shoe. Kindly explain which is correct.

Ans. The machine was always used upon the shoe prior to the attachment of the outer sole.

Int. 1347. I understand you to say, in answer to cross-question 621, page 615, that the shank-sticking machine went into use and was furnished to customers. Kindly state where the machine went into use, if you know. To whom did you furnish it? Where is it in use?

Ans. I cannot answer all three questions in the question that is of record.

Int. 1348. You say, in answer to cross-question 623, as I understand you, that the United Company furnished the shank-sticking machine to customers. Kindly state to whom the United Company furnished that machine, and, if you know, where it is in use at the present time.

Ans. Question 623 inquires about the new machine which the United Company constructed by combining the best features of the Wentworth machine and the machine with which we had previously been experimenting. This improved machine has been put out in large numbers, but I cannot state from memory the names of any manufacturers who have it, as I had no occasion to have such information.

Int. 1349. Can you, without inconvenience, make inquiry and answer from information thus obtained, giving the names of a few?

Ans. I should be glad to as soon as I can do so. I will endeavor to before the next session, or before tomorrow.

Int. 1350. In your answer to question 625 on page 621, you make reference to the "Wentworth shoe-beating machine". Kindly state whether the term "shoe-beating" as applied by you in that answer has reference to heel seat beading or to some other operation.

Ans. The machine which I was referring in my answer to question 625 was the Wentworth heel seat forming machine.

Int. 1351. On page 621, his Honor Judge Putnam inquired of

you whether the wire lacing replaced the hand method, to which I understand you answered yes. Kindly explain whether you meant by that answer that it had entirely replaced the hand method or whether it had replaced it to a large extent.

Ans. I meant by that answer that prior to the invention of the Ellis lacer it had been the universal practice to lace uppers by hand, prior to lasting.

Int. 1352. Then you did not mean to convey the impression, as I understand you, that the hand method of lacing went out of use when the wire lacing came into use?

Ans. I think that the hand method did not go entirely out of use upon the introduction of the Ellis lacer. I should qualify my answer by explaining that the hand method to which I refer is the introduction into the eyelets of the shoe of a string and the tying of that string by hand. Of course the Ellis lacer was also put into the shoe by hand, but its introduction into the shoe was a much simpler and quicker operation.

Int. 1353. You have no knowledge I suppose as to the extent to which the string method is now employed?

Ans. I assume that you mean the method employed prior to the introduction of the Ellis lacer. That is the lacing of the shoe by hand, and the tying of the string by hand?

Int. 1354. Yes.

Ans. On that understanding I will answer that I am confident that the hand lacing is practiced to only a very limited extent, and I should not be surprised to know that it was practically not done at all.

Int. 1355. On page 622 of the printed record, in referring to patents relating to metal lacing devices, you say in answer to cross-question 630: "Nearly all these patents read upon all forms of the lacer." And in answer to cross-question 631 you say: "Most of them cover the device which I showed in all its features." Will you kindly explain to the court what you mean by this phraseology? I ask the question because it would seem to indicate that in your view more than one patent described and claimed the same device.

Ans. Assuming that you are inquiring whether or not more than one patent read upon the same Ellis lacing device, I answer yes.

Int. 1356. Then will you point out what two or more patents cover, as you term it, the same device?

Ans. The Ellis bal. lacer. That is, the one which is formed with straight prongs as distinguished from the blucher lacer, which is formed with outwardly turned ends, was covered by patent 688,297, granted December 10, 1901, Ellis.

Int. 1357. The title?

Ans. "Fastening for shoe uppers." Also by No. 744,659, granted November 8, 1904, Ellis, fastener for shoe uppers; and also by patent No. 715,316, granted December 9, 1902, Sweeney, upper fastener for boots or shoes. The Ellis blucher lacer was also covered by several patents, as follows: No. 688,297, granted December 10, 1901, Ellis, fastening for shoe uppers; No. 744,659, granted November 8, 1904, Ellis, fastener for shoe uppers; No. 825,710, granted July 10, 1906, Ellis, fastener for shoe uppers, and No. 715,316, granted December 9, 1902, Sweeney, upper fastener for boots and shoes. The Ellis adjustable lacer was covered by the three patents already enumerated as covering the bal. lacer and also by No. 825,710, granted July 10, 1906, Ellis, fastener for shoe uppers. The adjustable lacer was also covered by application serial No. 525,987, filed November 3, 1909, upon which has been granted patent No. 999,765, dated August 8, 1911. The adjustable lacer was further covered by application serial No. 501,471, filed June 11, 1909, Ellis, upon which has been granted patent No. 988,322, dated April 4, 1911. The three lacers upon which I have stated the patent protection were the three which were put out to the largest extent at the time of the acquisition of the Ellis patents. There were, however, possibly half a dozen other types of lacers for special use, all of which were also covered by patents or applications which I shall be glad to enumerate if desired.

Int. 1358. Please do so.

Ans. The spring or semi-hinged Ellis lacer was covered by patent 688,297, granted December 10, 1901, Ellis; by patent No. 744,659, granted November 8, 1904, Ellis, and by patent 936,391,

granted October 12, 1909, Whelan. The hinged Ellis lacer was covered by patent No. 688,297, granted December 10, 1901, Ellis; No. 744,659, granted November 8, 1904, Ellis, and on No. 704,451, granted July 8, 1902, Ellis. The Pierce single lacer was covered by No. 653,929, granted July 17, 1900, Harlow, and No. 915,755, granted March 23, 1909, Ellis. We also acquired from the Ellis Lacer Company one patent on machines used in the manufacture of Ellis lacers, No. 795,209, granted July 18, 1905, Ellis and Chadwick.

Int. 1359. Where you say two or more patents covered the same device, do you mean that the patents were of the same scope, or were of some generic and some specific?

Ans. Relying upon my memory and without examining all of these patents, I should state that in some instances the relation of two or more patents reading upon the same device is that of generic and specific patents, while in other cases the patents covered different parts or features of the device in question.

Int. 1360. Then, is it your understanding that where a patent covers, as you term it, a different part from the part which is covered by another patent, that they both cover the same device?

Ans. I should consider that where two patents covered different parts of the same wire lacing device, they both cover that device.

Int. 1361. Were any of the applications upon which the patents referred to by you were issued involved in interference with any of the other applications upon which any of such patents issued?

Ans. I cannot answer that question without looking up the matter, but call attention to the fact that most of these patents were taken out by the same inventor, Warren E. Ellis.

Int. 1362. If you can without inconvenience ascertain the fact, will you kindly do so and testify to the same at some later session?

Ans. Do you desire any of this information more promptly than some other?

Int. 1363. No. No hurry about it.

Ans. You are outlining considerable work for me.

Int. 1364. I thought you perhaps had it tabulated.

Mr. CHOATE. Is the question of interference of importance in this inquiry?

Mr. WEBSTER. It is not of much importance, but where there are two patents on the same thing I should like to know why.

The WITNESS. The patents speak for themselves more quickly than I can ascertain and state to you.

Int. 1365. Then I understand it is not convenient for you to make the search in answer to that question?

Ans. I shall be glad to, if you desire it.

Mr. CHOATE. It involves a great deal of time.

The WITNESS. I did not speak of that so much in connection with this particular question, but the accumulation of matters which I am to look up is getting large and all together they will require considerable time.

Int. 1366. If it involves much trouble or inconvenience, I will not ask it. If you find it convenient and involving very little time, I should like it.

Ans. Under those circumstances I shall certainly get it for you.

Int. 1367. Referring to the purchase from Rice and LaChappelle on page 622, in answer to questions 632 and 633, you refer to patents and applications. Kindly state whether the applications referred to have yet merged into patents or whether the applications are now pending.

Ans. It will be necessary for me to examine the schedule referred to in that question before I can answer that question.

Int. 1368. I think the schedule refers to applications.

Mr. CHOATE. Can we have Exhibit 128?

[*Exhibit 128, schedule, produced by the examiner and inspected by witness.*]

Ans. Referring to schedule A in Plaintiff's Exhibit No. 128, application serial No. 326,687 mentioned in that schedule has matured into patent No. 1,030,736, granted June 25, 1912.

Int. 1369. And the title?

Ans. "Attachment for chain stitch sewing machine." Application No. 332,970 has matured into patent No. 1,030,784, granted June 25, 1912, chain stitch seam and method of making chain stitches.

Application No. 261,956 has matured into patent No. 1,048,549, improvement in lockstitch shoe sewing machines, granted December 31, 1912.

Int. 1370. Referring to the acquisition from the Carver Cotton Gin Company, you say in answer to question 640, page 623, that that company had gotten into the business of making two or three shoe machines through having manufactured, at one time and another, machines on contract for certain parties who did not have shops of their own, and that they had gotten into it accidentally. If these statements are facts within your own knowledge, kindly state for whom that company manufactured machines on contract for other parties.

Ans. Those statements were made on the authority of Mr. Hobart, the president of the Carver Cotton Gin Company; but I cannot at this time state the names of any parties for whom the Carver Company had so manufactured machines under contract.

Int. 1371. Can you give the name of any party for whom the Carver Cotton Gin Company made shoe machines?

Ans. I can upon looking it up. It is a matter of common knowledge.

Int. 1372. If you can ascertain the fact inquired about without inconvenience, kindly do so. In question 641, page 623, reference is made to the Acme leveling machine. Kindly state whether or not the Acme leveling machine referred to in that question and answer is illustrated in the catalogue of the United Company issued, as stated by you heretofore, in 1902; and, if so, on what page?

Ans. I think not. I do not find it in the index.

Int. 1373. State whether the Acme leveling machine referred to in the question and answer was manufactured and put out by the United Company.

Ans. When?

Int. 1374. At any time.

Ans. Yes, sir.

Int. 1375. State when as nearly as you can.

Ans. It was put out by us for some years prior to the acquisition of the business of the Carver Company. We purchased from

the Carver Company the machines which we put out. After that acquisition, we continued to put out these machines in increasing numbers, — in large numbers.

Int. 1376. Was the United Company putting out the Acme leveling machine in 1907?

Ans. Yes, sir.

Int. 1377. Are they now putting it out?

Ans. Yes, sir.

Int. 1378. Is the particular machine referred to in question and answer 641 covered by patents owned by the United Company?

Ans. I believe the machine as now put out embodies an invention covered by a pending application.

Int. 1379. Then, as I understand your answer, so far as you know, the machine as acquired from the Carver Cotton Gin Company was not protected by any patent?

Ans. That is true.

Int. 1380. Kindly state, if you are able, the names of some of the concerns now using the Acme leveling machine.

Ans. I believe I have recently been informed that there is one of those machines in the factory of A. E. Little & Company in Lynn. They are in very general use, however.

Int. 1381. In what department of the United Company are the Acme leveling machines classified?

Ans. I believe that machine is in the general department; in fact, I am positive that it is.

Int. 1382. In answer to cross-interrogatory 646, page 624, I understand you to say that the peculiarity of the Acme leveler is that it is principally of utility on freak shoes. Kindly state if my understanding is correct.

Ans. It is not.

Int. 1383. Kindly state what you mean by the answer referred to.

Ans. The word "that" in this answer refers back to interrogatory 641 and the intervening interrogatories and answers.

Int. 1384. Then you wish to be understood that the Acme level-

ing machine is adapted for freak shoes and sample shoes only, or do you mean that it is adapted for use on any kind of shoe?

Ans. As pointed out in my answers to questions 646 and 647, the Acme leveler was particularly useful,—was and is particularly useful on sample or freak shoes, every consecutive one of which may be of different size or shape. The movements of the roll and jack on this machine are entirely hand controlled, while the Goodyear automatic leveling machine, which is the machine in general use for leveling welt shoes, must be adjusted for every variation in size or shape of last. The automatic leveler is so very much faster and does so much better work than the Acme that it is almost universally used for the regular work going through the factory; and, as I have stated, the Acme is used on sample and freak shoes.

Int. 1385. Then, as I understand you, the Acme leveling machine is adapted for use on all kinds of shoes?

Ans. No, sir.

Int. 1386. Upon what kind of shoes is it not adapted for use?

Ans. It is not adapted for use on turned shoes because it is too heavy; it exerts too much pressure; it is not adapted for use on McKay shoes because it is a roll machine and operates upon the shoe while the last is in it, while the McKay shoe requires a greater amount of pressure than can be exerted by the Acme machine and is leveled after the last has been removed from the shoe.

Int. 1387. Then do you mean that the Acme leveling machine is adapted for use upon all welt shoes?

Ans. The Acme machine could be used upon all welt shoes, but no manufacturer could afford to level his regular line of shoes upon that machine because it is extremely slow as compared with the automatic leveler, and the work which it does is not equal to the work of that machine.

Mr. WEBSTER. All that portion of the answer following the words "but no manufacturer" is objected to as not responsive. Counsel moves that it be stricken out.

Int. 1388. Referring further to the purchase of the Carver Cotton Gin Company, you say, on page 646, that the Amazeen skiver could not be used with commercial success as the vamp skiver pur-

chased of the Carver Cotton Gin Company. Will you kindly explain what you mean by that answer and explain why it could not be used with commercial success provided it were made of sufficient strength?

The WITNESS. Give me Defendants' Exhibits 28 and 29.

[*Question read by the stenographer.*]

Ans. The Amazeen machine was equipped with a light rotating knife, and the stock was fed to it by a thin rotating disc. This construction was particularly well adapted for light leathers, and if the parts were made heavy enough for heavy leather, the machine would not operate satisfactorily on the lighter leathers, for which it is particularly constructed and designed.

Int. 1389. Will you kindly examine the cut of machine on page 132 of the United Shoe Machinery Company catalogue issued, as stated by you, in 1902, and state whether it illustrates the Amazeen skiver referred to by you in the several previous answers?

Ans. The cut on page 132 of the catalogue referred shows the Amazeen skiving machine as it was put out at the date when this catologue was issued; that is, in 1902.

Int. 1390. Did the United Company put out the skiver purchased by it of the Carver Cotton Gin Company?

Ans. Yes, sir; we have put out that machine continuously since the purchase.

Int. 1391. What is its commercial name?

Ans. Carver vamp skiving machine.

Int. 1392. Is it illustrated in the catalogue of 1902?

Mr. CHOATE. Probably not. We did not buy it until 1908.

Mr. WEBSTER. Well, it is for him to say.

Ans. It is not illustrated in that catalogue.

Int. 1393. Is any machine illustrated in that catalogue adapted for accomplishing the same work as the skiver purchased of the Carver Cotton Gin Company?

Ans. I think not.

Int. 1394. Has the United Company any illustrations or descriptive printed matter relating to the skiver purchased of the Carver Cotton Gin Company?

Ans. Yes, sir; I have a leaflet which illustrates the Carver machine.

[*The witness produces leaflet relating to Carver vamp skiving machine, which is marked "Plaintiff's Exhibit 192".*]

Int. 1395. Kindly state whether the Carver vamp skiving machine illustrated in a leaflet produced by you and put in evidence as Exhibit 192 is constructed the same as the vamp skiver purchased of the Carver Cotton Gin Company.

Ans. I believe the construction of the machine shown in the exhibit is substantially the same as that of the machine acquired from the Carver Company.

Int. 1396. Referring now to the Amazeen skiving machine illustrated on page 132 of the catalogue heretofore referred to, kindly state whether the machine as there illustrated was put out by the United Company immediately after its organization in 1899.

Ans. This machine has been improved from time to time by the embodiment in it of inventions made since the United Company was organized, but the machine which the United Company has been putting out since its organization is of the same general type as that shown in the cut on page 132 of the catalogue.

Int. 1397. State if you know whether the Amazeen skiver illustrated on page 132 was put out by any of the companies which went to make up the United Company at the time of its organization.

Ans. It is my recollection that at the time the United Company was organized the Amazeen skiving machine was put out by the Amazeen Skiving Machine Company, the officers of which were closely related to the officers of the United Company, and the business was done in the same offices.

Int. 1398. And can you tell when the Amazeen Skiving Machine Company was organized?

Ans. I cannot, from my recollection.

Int. 1399. Was it prior to the organization of the United Shoe Machinery Company?

Ans. I think so.

Int. 00. Will you state what patents, so far as you know, were in existence at any time relating to the Amazeen skiver?

Mr. CHOATE. Pause a moment. Will you point out where that was opened on cross-examination?

Mr. WEBSTER. I cannot say that it was specifically referred to, although reference has been made to the Amazeen skiving machine.

Mr. CHOATE. Well, only to the fact that the United Company had such a machine at the time that it bought the Carver vamp skiving machine.

Mr. WEBSTER. Will you instruct the witness not to answer?

Mr. CHOATE. If there is anything that you can point out that shows that it was brought out on cross-examination, I won't object to his answering.

Mr. WEBSTER. I am strongly of the opinion that it is referred to in the cross-examination in such a manner as will entitle us to make the inquiry, but I am fearful that the time required to hunt it up will be far greater than to take it up at a later time.

Mr. CHOATE. Well, do you think that it is mentioned on cross-examination except on pages 646 and 647?

Mr. WEBSTER. I could not say. I am very strongly of the impression that it was referred to in such a manner as to entitle us to make the inquiry.

Mr. CHOATE. Well, I feel quite confident that there has been no mention of patents on that machine, so I shall instruct the witness not to answer until the court orders him to.

The WITNESS. Under instructions, I decline to answer.

Int. 1401. State, so far as you are able, when the Amazeen skiver, constructed as illustrated on page 132 of the catalogue referred to, first went into use.

Ans. I think the machine shown in that drawing incorporated inventions made shortly before the publication of this catalogue, so that this particular machine, as illustrated in the drawing, had not been in use for more than a year or so.

Int. 1402. Had there been another skiving machine made previously which was known as an Amazeen skiver?

Ans. Yes, sir.

Int. 1403. Can you point out briefly how it differed from the construction illustrated on page 132?

Ans. If agreeable I should prefer to defer answering that question until I have an opportunity to refresh my recollection by examining prior types of machines and the patents which cover the various types of machines.

Int. 1404. That is quite agreeable to counsel. In answer to cross-question 666, on page 648, you say, referring to the vamp skiver and Acme leveler: "The patents at that time had expired on those two machines. They were comparatively simple machines." Will you kindly state, if you are able at the present time, what patents had previously been issued relating to the vamp skiver and Acme leveler referred to by you in answer to the question?

Ans. I have not the data as to these patents at hand, but shall be glad to look them up, if desired.

Mr. WEBSTER. If not too much trouble, I would like to know of them.

Int. 1405. Referring now to the purchase from the Richardson Shoe Machinery Company, referred to in Exhibit 125, commencing "Inventions and Patents on the Improved McKay Sewing Machine", kindly state whether the applications referred to in schedule attached to Exhibit 125 have since merged into patents. I notice at the heading of the Schedule D as follows: "Patents (including applications and interest of Richardson Company)." Kindly state, if you know, whether any applications for patents were included in the transfer.

Ans. I do not recall that any applications for patents were assigned as a part of this transaction.

Int. 1406. You say in answer to cross-question 687, on page 650: "The claim of one of these patents clearly covered a very important feature of the Model B machine." Will you kindly state what patents contained the claim referred to, and state also in a general way what you mean by "Model B machine"?

Ans. The claim referred to was claim 16 of Richardson patent No. 710,613, dated October 7, 1902. The Model B machine, referred to in the answer to question No. 687, was the Model B McKay sewing machine of the United Company.

Int. 1407. And did the United Company then continue to put out the Model B McKay machine?

Ans. After what date?

Int. 1408. After the date of the purchase from the Richardson Company.

Ans. Yes, sir.

Int. 1409. And have they since continued to put it out?

Ans. Yes, sir.

Int. 1410. And is the machine now in common use, so far as you know?

Ans. Yes, sir.

Int. 1411. Can you state some one or more of the places where itis in use?

Ans. Not from memory, but I can easily ascertain.

Int. 1412. As I understand you, this machine, Model B, was not adapted for use on welt shoes at all?

Ans. Not at all. It was the essence of the machine that it should be adapted for use in attaching soles to McKay shoes.

Int. 1413. Referring now to the purchase from Booth Brothers, Exhibits 121, 122, 123 and 124, you refer, among other things, to a fudge-edge machine. Kindly state whether or not a fudge-edge machine is a machine for ornamentation.

Ans. A fudge-edge machine is intended and adapted for performing two operations simultaneously; that is, the formation of stitch impressions on the upper face of a sole edge and setting or burnishing the edge of the sole. This machine is adapted for performing such operations on light-weight McKay shoes or turned shoes.

Int. 1414. Purely ornamental, is it not?

Ans. No, sir; I should hardly regard the edge setting as pure ornamentation.

Int. 1415. You say that a fudge-edge machine operates to ornament as well as set the edge?

Ans. Yes, sir.

Int. 1416. I notice in question 709 reference is made to a fudge-edge machine. If that machine was covered by a patent, so far as you know, will you kindly point out what patent?

Ans. That machine was covered by patent 852,703, Carnes, granted May 7, 1907, wheeling and edge-setting machine.

Int. 1417. Then, is the term "fudge edge" a fanciful term?

Ans. The term "fudge-edge maker" or "fudge-edge machine" is one which has been used to describe a machine or tool for performing two operations,— performing simultaneously these two operations. I do not know the origin of the expression.

Int. 1418. Reference has been made in the same question to a wheeling machine. Kindly state how the operation of the wheeling machine differs from the operation of the fudge-edge machine.

Ans. Booth wheeling machines were used for the purpose of making a stitch impression upon the upper face of the edge of the sole of a welt shoe to prepare that face of the sole edge for the operation of the stitch-burnishing machine.

The fudge-edge machine, so far as its wheel operation was concerned, was complete in itself; that is, the upper face of the sole edge operated upon by the fudge-edge machine did not require any further treatment, and specifically did not require any burnishing, as did the edge of the welt shoe after it had been operated upon by the wheeling machine. The operations of the two machines further differed in that the fudge-edge machine was not adapted for use upon welt shoes, and its field was limited, as I have already stated, to light McKays or turns. This Exhibit 30, which is a shoe which has been operated upon by the fudge-edge maker, is a light McKay.

Int. 1419. Was the wheeling machine referred to in the question the subject-matter of a patent? And, if so, state what one.

Ans. Booth Brothers had two types of wheeling machines; one, known as the ratchet wheeler, was covered by the patent 817,309, granted April 10, 1906, Flynt; and No. 826,352, granted July 17, 1906, Olson and Flynt. The first was clutch and the second shoe machine. That machine was inactive at the time of the acquisition, as it had been superseded by an improved machine known as the Booth geared wheeler, which was covered by patent 958,913, granted May 24, 1910, Flynt imitation stitch machine.

Int. 1420. Reference is made in the same question to upper-shap-

ing machine. Kindly state whether the upper-shaping machine relates to the shaping of uppers.

Ans. Yes, sir. That was a simple machine for holding the upper of a shoe while it was cleaned.

Int. 1421. Patented?

Ans. I believe not. It was a very simple machine.

Int. 1422. Reference is also made in the same question to beading machine, notably the Columbia and Victor. Kindly state whether the beading operation related to uppers or to some other part of the shoe.

Ans. This beading operation was the operation known as upper beading. The operation was performed in the turning right side out of the lining and upper after they had been sewed together, that sewing operation being performed while the lining and upper are wrong side out.

Int. 1423. In answer to question 709, you refer to the Stillman A. West patent. While you may have given the date and number at some other point, I will ask you to kindly point out at this stage the date and number of the patent, if you can conveniently do so.

Ans. Later in the record I stated the number and date of the patent to Stillman A. West under which the Rochester lacer was manufactured. I believe I have not the date at hand, but possibly you will not be interested when I state that that patent was never acquired by the United Shoe Machinery Company, but that some years before the date of the Booth Brothers acquisition an exclusive license under the patent was granted to, and is still held by, the Boston Machine Works, of Lynn.

Int. 1424. Are the Boston Machine Works related in any way to the United Company?

Ans. No, sir.

Int. 1425. Did the United Company ever put out the Rochester lacer?

Ans. I think not; if it did, it purchased the machine from the Boston Machine Works.

Int. 1426. In answer to question 719, page 655, you refer to the

pending application. Kindly state whether the application referred to has merged into a patent.

Ans. No, sir.

Int. 1427. In answer to question 759, on page 660, you speak of a patent on a machine, the patent having expired. Will you kindly state what patent you had reference to, if you can do so at the present time?

Ans. I have not at hand the data of the patent on the Booth upper-shaping machine, but will look it up if you desire.

Int. 1428. If you can get at it readily without any loss of time and annoyance, I would like it; otherwise, not.

Ans. I shall be glad to get it.

Int. 1429. In cross-question 763, on page 660, reference is made to a heel-burnishing machine. Kindly advise whether the heel-burnishing machine is used for any purpose other than polishing or burnishing the heel.

Ans. I am not aware that a heel-burnishing machine is ever used otherwise than for burnishing heels.

Int. 1430. And the burnishing operation is a finishing operation, is it not?

Ans. Yes, sir.

Int. 1431. In answer to cross-question 765 reference is made to various pending applications. Will you kindly state whether any of those applications have merged into patents?

Ans. Application serial No. 252,647 has matured into patent 1,030,049, granted June 18, 1912. Application serial No. 304,880 has matured into patent No. 1,024,612, granted April 30, 1912.

Int. 1432. If you will give the titles, please?

Ans. The title of the first is: "Burnishing tool for boots and shoes." The title of the second is: "Tool for finishing the heels of boots and shoes."

Int. 1433. Does that take them all?

Ans. The patent on the other application, serial No. 252,646, has not yet issued.

Int. 1434. In question 770 reference is made to pending applications; the same are not, however, identified. Will you kindly

state whether those applications are pending or whether patents have been issued upon them?

Ans. I shall have to see the schedule, to identify the applications, Mr. Webster. [*Examines schedules, Exhibits 117 and 118.*] The application serial No. 245,704 has matured into patent 946,789, granted January 18, 1910, Smith, needle for shoe-lacing machines. On the schedule is enumerated application serial No. 296,385. That may be an error, as I find that the application serial No. 296,388 was filed January 16, 1906, and matured into patent 962,105, Smith, granted June 21, 1910, fastening machine. Serial No. 245,704 matured into patent 946,789, granted January 18, 1910; I have already given that, I believe. Application serial No. 259,839 was for reissue of patent No. 779,008, granted January 3, 1905.

Int. 1435. The title?

Ans. "Machine for automatically lacing shoe uppers." That reissue was granted on April 23, 1907, No. 12,638. That accounts for the three applications enumerated in the schedule.

Int. 1436. In answer to cross-interrogatory 787, page 665, reference is made to infringing some patents that cover the machine of Campbell and Nichols, which I understand was a tack puller. Will you kindly specify what patents you have reference to?

Ans. The patent which was infringed by the experimental machine of the United Company which was being developed at the time of the acquisition of the tack puller patents of the Brockton Supply Company was No. 777,795, granted December 20, 1904, Lyon.

Int. 1437. The title?

Ans. "Machine for pulling lasting tacks."

Int. 1438. In answer to cross-question 796, on page 666, you refer to an application by serial number and date. Kindly state whether a patent was issued on that application.

Ans. Courteau application serial No. 320,611 matured into patent No. 891,912, granted June 30, 1908, machine for supporting shoe uppers.

Int. 1439. Referring to acquisition of the property of Booth

Brothers, you refer to a considerable extent to perforating machines. Kindly state whether these machines related to or were designed for ornamenting the uppers of shoes, or for some other purpose.

Ans. They were designed for ornamenting uppers or parts of uppers of boots and shoes.

Int. 1440. Referring to the acquisition from Arnold, you speak of cementing machines, and I understand you to say that the patent and machine became valueless because of a machine put out by manufacturers having adhesive material. Kindly state if I am correct in my understanding.

Ans. The machine constructed under Dunn patent No. 728,793, May 19, 1903, and 930,593, August 10, 1909, was intended and adapted for applying cement to the flesh side of an insole preparatory to the application to the insole of reinforcing material. At about the time of the acquisition of these patents by the United Company prepared canvas, that is, canvas having adhesive material on it, or rather, canvas which was already provided with adhesive material, was put upon the market by several concerns other than the United Company, and as the use of this canvas effected a considerable economy over the older operation of cementing the canvas in the shoe factory, as well as being much cleaner and more convenient, the prepared canvas went into almost universal use, so that there was no longer any demand for machines constructed under the patents acquired from Arnold.

Int. 1441. In answer to cross-question 839, page 675, you seem to refer to needles furnished to users of Goodyear machines. Will you kindly define what you mean by "Goodyear machines" in that connection?

Ans. Welters and stitchers.

Int. 1442. Then, as I understand you, welters and stitchers put out by the United Company are commercially known as Goodyear machines; am I correct?

Ans. The welter put out by the United Company is known as the Goodyear welter, and the stitcher put out by the United Com-

pany is known as the Goodyear stitcher; that is, colloquially. Of course, the company has its own names for different models.

Int. 1443. Referring to your testimony relating to the acquisition from the American Glue Company, I understand no patents or inventions were involved in the transaction; am I correct?

Ans. I believe so.

Int. 1444. Referring to your testimony with reference to brushes, it is my understanding that the brushes are used for finishing purposes; kindly advise if I am correct.

Ans. If that term be used with a broad meaning, it probably covers the various uses to which brushes are put. It should be broad enough to include cleaning.

Int. 1445. On page 683 reference is made in your examination to cementing machine acquired from Joseph P. Curtis. Kindly state whether the machine or device referred to was the subject-matter of a patent.

Ans. Yes, sir. This machine was covered by patent No. 789,-718, granted May 16, 1905, J. P. Curtis, machine for applying adhesive or other coatings to sheets. At the time of the acquisition the application for this patent was still pending, serial No. 174,913, filed September 28, 1903.

Int. 1446. Reference is made in your examination, on page 685, to a Kreig machine for trimming the heel and sole. Kindly say whether the machine referred to by you was patented.

Ans. Yes, sir. The patent was No. 560,829, granted May 26, 1896, G. A. Ambler, rounding or trimming machine.

Int. 1447. The machine, as I understand you, had a cutter with an up and down motion?

Ans. Yes, sir; a reciprocating knife.

Int. 1448. A knife which operated similar to a mortising machine?

Ans. Well, the knife had an up and down and back and forth movement. It was arranged to feed the work as well as to cut off the material which it was designed to remove.

Int. 1449. So that it is not, as I understand, to be used on the Goodyear sole?

Ans. Yes, sir; in trimming the heel seat of a Goodyear shoe.

Int. 1450. Is it not true that the Goodyear soles are oftentimes cut to shape at the outset, the shape following the contour of the finished sole?

Ans. I believe that they are never so shaped prior to the — never so shaped at the heel end of the sole prior to the operation of the Goodyear outsole stitcher as put out by the United Company.

Int. 1451. I find here, in answer to question 934, a patent is mentioned. I take it to be the patent you have just testified to, 560,829, May 26, 1896.

Ans. That is the number of this patent; yes, sir.

[*Adjourned to 10.30* A. M., *July 16, 1913.*]

BOSTON, MASS., July 16, 1913.

Int. 1452. During the course of your examination, you kindly consented to bring in data and memoranda with reference to various matters you were unable to give during the time you were testifying. If you have any of that data, will you kindly spread it on the record at the present time?

Ans. You wished me to ascertain from whom the United Company was purchasing peg wood prior to the acquisition of the business of B. F. Sturtevant. I find that all the peg wood purchased by us prior to that date was obtained from B. F. Sturtevant. You requested the names of the users —the names of some users of the present commercial shank-sticking machine of the United Company. The names of four of the users are as follows: Endicott, Johnson & Company, Leicestershire, New York; George B. Jones & Company, Manchester, New Hampshire; Sears, Roebuck & Company, Springvale, Maine; A. E. Little & Company, Brockton, Massachusetts. You requested me to name one or more parties for whom the Carver Cotton Gin Company made machines under contract prior to the acquisition of the business of the — shoe machinery business of the Carver Company by the United Company. I am informed that the Carver Company made all the machines which were put out by S. D. Tripp until the Tripp patents ran out, after which the Carver Company made and sold these Tripp machines itself.

Int. 1453. Kindly state what character of machine you refer to when you speak of the Tripp machine.

Ans. As I recall, the Tripp machine was an edge-setting machine which became obsolete long ago. You requested me to obtain the data of the expired patents on the Acme leveling machine. These patents were No. 266,283, Gilmore, dated October 24, 1882, sole leveling machine; No. 344,650, Gilmore, dated June 24, 1886, sole leveling machine, and No. 403,495, Strong, dated May 14, 1889, sole leveling machine. You requested me to look up the expired patents on the Booth upper shaper. I find that these patents were numbered 355,966, I. E. Booth, dated January 11, 1887, a machine for stretching and finishing shoes, and No. 364,888, I. E. Booth, dated June 14, 1887, shoe-stretching machine. Perhaps I should add that I had learned that the machine had become obsolete before the acquisition of the business of Booth Brothers. You requested me to ascertain whether any of the applications for the patents of the Ellis Lacer Company had been involved in interferences with the applications for any other of the patents of the Ellis Lacer Company. A brief investigation indicates that there were no such interferences. You requested me to state the names of some users of the United Company's Model B McKay sewing machine. May I inquire as to the location of factories which you would prefer?

Int. 1454. Anything that is within easy reaching distance.

Ans. I will then name the following manufacturers located in Lynn as users of the Model B McKay sewing machine: Allen, Foster, Willett Company, George F. Daniels Company, William H. Ingalls Company, Adams Shoe Company, Tufts & Friedman, C. E. Blake & Company, John R. Donovan & Company. You also requested me to look up the data of the interferences in which the Stanbon application for channel-cementing machine, on which was granted patent 1,004,705, was involved, and to ascertain how many patents had been granted on the applications which were involved in those interferences. I find that the Stanbon application was involved in nine interferences, of which I can give the data if you desire.

Int. 1455. If you can give some of the data very briefly, that, perhaps, will be sufficient.

Ans. The numbers of the interferences in which the Stanbon application was involved were No. 25,427, 25,428, 25,429, 25,430, 25,431, 25,432, 25,433, 26,519, 26,520. Replying to the second part of your question, in addition to the Warren patent 1,030,623 and the Stanbon patent, to which I referred yesterday, I find that the following patents have been granted upon applications which were involved in one or more of these interferences: No. 1,030,659, C. E. Howe, dated June 25, 1912, cementing machine; No. 1,043,083, F. M. Furber, dated November 5, 1912, cementing machine. That is all the information that I have been able to get so far in response to your requests.

Int. 1456. You have testified to a considerable extent with reference to assignments of patents. Kindly state whether you have custody of the records of assignments, or whether you procured your information from some other official.

Ans. I personally have charge of all assignments of patents to the United Company, which are kept in safes in my offices.

Int. 1457. Do you also have charge of assignments of patents to the companies that are associated or affiliated with the United Company?

Ans. I have the custody of the assignments of nearly all, if not all, of those companies.

Int. 1458. In testifying in reference to the Arthur Fuller acquisition referred to in Exhibit 98, I understand you to say that the machine purchased of Arthur Fuller, doing business under the name of American Sole Laying Machine Company, was a double sole-laying machine, and that the United Company afterwards purchased a sole-laying machine from the Boot & Shoe Laying Machine Company, and that afterwards there was some combination of these machines which together went to make up the Goodyear improved twin sole-laying machine. Kindly state whether my understanding or interpretation of your testimony is correct. You will find that on page 697, and following.

Ans. The United Company had, previously to the acquisition

of the patents of the American Sole Laying Machine Company, acquired patents from the Boot & Shoe Sole Laying Company, under which it was putting out a single form sole-laying machine. The American Company held a license under Cutcheon patent No. 384,893, dated June 19, 1888, which enabled the American Company to put out a two-form sole-laying machine. That patent prevented the United Company from transforming its single-form machine into a two-form machine until this license was required from the American Company. After that acquisition, the United Company made a two-form machine of the machine which it had acquired from the Boot & Shoe Company, and that machine, as improved by the embodiment in it of subsequent inventions, is known as the Goodyear improved sole-laying machine.

Int. 1459. Did the American Sole Laying Company put out the sole-laying machine prior to the acquisition of the assets of that company by the United Company?

Ans. Yes, sir.

Int. 1460. And for how long a time prior to such acquisition had the American Sole Laying Company been putting out such machine?

Ans. I cannot state at this time for how long a period. I think, however, that they had put out such a machine for several years.

Int. 1461. By "several years" do you you mean three or four or five or six or seven years?

Ans. I cannot state it more accurately without looking it up.

Int. 1462. Do you know if many such machines had been put out by the American Sole Laying Machine Company?

Ans. I cannot from memory state the number more definitely than to say that I am confident that it was a substantial — that they had put out a substantial number of machines.

Int. 1463. Did the United Company put out any machines after its purchase from the American Sole Laying Machine Company constructed like the machines which had previously been put out by the American Sole Laying Machine Company?

Ans. After the acquisition of the American Sole Laying Machine Company the United Company put out the improved machines to

which I have referred, which embody the inventions of several of the patents acquired from the American Company. I am not advised whether or not machines identically like the drawings of any of the patents acquired from the American Company were put out by the United Company after the acquisition of those patents.

Int. 1464. Then, as I understand you, the acquisition from the Boot & Shoe Sole Laying Company was prior to the acquisition from the American Sole Laying Machine Company?

Ans. Yes, sir.

Int. 1465. And can you state for how long a time the Boot & Shoe Sole Laying Company had been putting out its laying machine prior to the acquisition of the assets of that company by the United Company?

Ans. The Boot & Shoe Sole Laying Company had been putting out its machine for some years prior to the acquisition of its patents by the United Company.

Int. 1466. State, if you know, whether they had put out a substantial number of machines.

Ans. I think they had put out the machine in considerable numbers.

Int. 1467. Did the United Company put out machines constructed like those previously constructed by the Boot & Shoe Sole Laying Company?

Ans. Yes, sir.

Int. 1468. And for how long a time did it continue to do so?

Ans. The United Company has continuously, since the date of the acquisition of patents of the Boot & Shoe Sole Laying Company, put out machines substantially like those put out by that company, except that, as I have already stated, the machine was made a two-form machine after the acquisition of the patents of the American Sole Laying Machine Company, and the machine has further been substantially improved from time to time by the embodiment in it of other inventions.

Int. 1469. Is the machine known as the Goodyear improved twin sole-laying machine the same machine you refer to in your last answer?

Ans. Yes, sir. Perhaps I should add that the machine may not have been known by that name during the entire period.

Int. 1470. State as nearly as you can for about how long a period of time the machine in question has been known as the Goodyear improved twin sole-laying machine.

Ans. Before the twin machine was developed subsequently to the acquisition of the patents of the American Sole Laying Machine Company, the machine put out by the United Company under the patents acquired from the Boot & Shoe Sole Laying Company was known as Goodyear improved sole-laying machine. This was the name by which the machine was known in 1902. I think it was within a short time after that date that the twin machine was developed.

Int. 1471. Kindly state whether an illustration of the Goodyear improved sole-laying machine referred to by you is found in the catalogue produced by you, published in 1902; and, if so, state upon what page the illustration is found.

Ans. Yes, sir. This machine is illustrated on page 22 of that catalogue.

Int. 1472. Will you briefly point out to the court the difference in construction of that machine from the construction of the machine of the Boot & Shoe Sole Laying Company?

Ans. The machine shown on page 22 of the catalogue in question is substantially the same machine which was put out by the Boot & Shoe Sole Laying Company.

Int. 1473. Have you an illustration of the Goodyear improved twin sole-laying machine?

Ans. I have not such an illustration with me.

Int. 1474. Will you kindly produce one?

Ans. I shall be glad to.

Int. 1475. Kindly state whether the sole-laying machine illustrated on page 22 of the catalogue is a single or a double machine.

Ans. It is a single machine.

Int. 1476. Is the single machine like the illustration referred to being put out at the present time by the United Company?

Ans. If manufacturers call for it, — but I think manufacturers

always prefer the double machine on account of its much greater capacity.

Int. 1477. Then, as I understand you, it is not being put out so far as you know?

Mr. CHOATE. Would it be more correct to say it is not called for?

Mr. WEBSTER. His answer is: "Not unless."

Int. 1478. The question is whether you have any knowledge as to whether the machine is in fact put out or not.

Ans. I cannot state at this time, because I have no occasion to have such information.

Int. 1479. Referring to the acquisition from the O. A. Miller Company referred to in Exhibits Nos. 93, 94 and 95, relating to treeing machines, I understand you to say that that was a new branch and that the treeing machines are essential for the process of finishing shoes. Kindly refer to the record on page 701, interrogatory 1072 and following, and state whether my understanding is correct.

Ans. At the date of this acquisition, the United Company had no machines of any description adapted for use in the treeing of shoes. That operation is the operation of cleaning and finishing the uppers after the manufacture of the shoe has been otherwise substantially completed.

Int. 1480. Kindly state just what you mean by the employment of the term "essential".

Ans. I did not use that expression.

Int. 1481. You seem to have adopted it as it was incorporated in the question. Kindly state, then, whether you intended to say in your cross-examination that treeing machines were essential to the process of finishing shoes.

Ans. As I read my answer to cross-interrogatory 1073, I seem to have answered the second part of that interrogatory and to have overlooked the first part.

Int. 1482. Will you now state whether you consider the treeing machines referred to essential to the process of finishing shoes?

Ans. I will answer that question by stating that present trade

conditions require that the treeing operation be performed upon shoes in the course of their manufacture.

Int. 1483. Will you kindly state just what you mean by the word "essential"?

Mr. CHOATE. He has not used it.

Mr. WEBSTER. I think he did in the last answer.

[*Answer read by the stenographer.*]

Int. 1484. Are you willing to state whether you used the word "necessary" as synonymous with "essential"?

Ans. I believe I have used neither word.

Int. 1485. Kindly state whether you used the word "require" as synonymous with "essential".

Ans. I intended to use the word "require" with its ordinary meaning.

Int. 1486. Referring now to the eyelet purchases, I think you produced at the time of your cross-examination some specimens of eyelets made under certain of the patents referred to by you. Will you kindly produce some duplicates?

Ans. I now produce samples of fast-color eyelets.

The EXAMINER. Samples of fast-color eyelets are "Plaintiff's Exhibit 193".

[*Ans. continued:*] Also samples of enamel eyelets.

The EXAMINER. Samples of enamel eyelets are "Plaintiff's Exhibit 194".

Int. 1487. Kindly point out briefly what patents cover the fast-color eyelets and what patents cover the enamel eyelets.

Ans. The fast-color eyelet was covered by patent No. 557,992, Kempshall, granted April 7, 1896, "eyelet". At the time of the acquisition there was pending an application covering the dies which were used in applying celluloid to the eyelets, which application had been filed February 9, 1895. That application was forfeited and was renewed August 23, 1902, serial No. 120,856. A patent was granted on the renewed application, No. 786,694, Kempshall, dated May 9, 1905, "dies for applying covering material to the faces of eyelets". The method of covering these fast-color eyelets was originally claimed in the die application filed

February 9, 1895. A divisional application covering this method was filed April 17, 1905, serial No. 255,990, on which application was granted patent No. 789,695, Kempshall, dated May 9, 1895, "method of forming eyelets".

Int. 1488. In answer to cross-question 1110, on page 707, you say that the Boot & Shoe Sole Laying Company, you are confident, had some of the Eppler patents, which you were to supply later. Kindly advise whether you have the list at the present time.

Ans. I can now state, if you desire, the data of all the patents or inventions which were incorporated in the machine of the Boot & Shoe Sole Laying Company at the time of its acquisition.

Int. 1489. Kindly give the name, title and date of the patents referred to in your answer to question 1110, on page 707, referred to as Eppler patents.

Ans. The Eppler patent to which I had reference in that answer was No. 315,923, April 14, 1885, "Eppler sole laying machine".

Int. 1490. Is that all?

Ans. My answer, to be responsive, should include other patents granted to Andrew Eppler, Junior, in addition to the one which I just named. The one which I named covered an invention embodied in the commercial machine, and in additon —

Mr. CHOATE. Wait a minute. What commercial machine?

The WITNESS. In the commercial machine put out by the Boot & Shoe Sole Laying Company at the time of the acquisition of its patents. Other patents acquired in that transaction which were granted on application of Andrew Eppler, Junior, were as follows: No. 304,415, September 2, 1884, sole-laying machine; No. 304,-416, September 2, 1884, sole-laying machine; No. 315,922, April 14, 1885, sole-laying machine; and No. 315,924, April 14, 1885, sole-laying machine.

Int. 1491. Referring to the Swain-Fuller Company acquisition (Exhibit 88), you refer in answer to question 1112, page 707, to "the Star leveling machine". Will you kindly briefly describe the construction of the Star leveling machine referred to by you?

Ans. The Star leveling machine as it was constructed at the time of the acquisition of the patents of the Swain-Fuller Manufacturing

Company was constructed substantially as shown in patent No. 435,882, A. K. Washburn, granted September 2, 1890, sole leveling machine, with the changes in that machine, shown in Washburn patent No. 435,883, granted September 2, 1890, sole-leveling machine.

Int. 1492. Kindly state whether the term "Star" as used in connection with a leveling machine was a trade name or designation.

Ans. It was a trade name in the proper sense, that is, an arbitrary name adopted by the manufacturers. It did not indicate any type of machine at the time the name was adopted.

Int. 1493. Does it now indicate a particular type of machine?

Ans. The name is still used to designate the machine which is still manufactured and put out by the United Company substantially as shown in the patents which I named.

Int. 1494. If the Star leveler is illustrated in the catalogue heretofore referred to, will you kindly point out the page?

Ans. The Star leveling machine is illustrated on page 171 of the 1902 catalogue of the United Company.

Mr. WEBSTER. Counsel for the Government offers in evidence the cut and printed matter on page 171 of catalogue of 1902.

[*Cut and printed matter on page 171 of catalogue of the United Shoe Machinery Company marked "Plaintiff's Exhibit 195".*]

Mr. WEBSTER. Counsel for the United States also offers in evidence cut of the Goodyear improved sole-laying machine and the printed matter shown on page 22 of the catalogue.

[*Cut and printed matter on page 22 of catalogue of United Shoe Machinery Company marked "Plaintiff's Exhibit 196".*]

Int. 1495. In answer to question 1132, on page 709, you say that the United Company had no machines for doing the work of nineteen of the machines referred to by you procured of the Ross-Moyer Company and specified in answer to cross-interrogatory 1118. You say that one of them, the heel seat beading machine, was a duplicate or did the same work as one which the company already had. On counting the list I find but nineteen in the list. Will you kindly state whether I am in error or whether some correction is required in your answer?

Ans. The list is correct, and I should have said eighteen instead of nineteen in my answer to cross-interrogatory 1132.

Int. 1496. The first on the list appears under the heading of "rolling machine". Will you kindly briefly state what a rolling machine is?

Ans. The chief use to which a rolling machine is put is to apply heavy pressure by means of rolls to sides of sole leather, to smooth it out and correct so far as possible lack of uniformity in thickness and in hardness of the stock.

Int. 1497. Kindly state briefly what a bottom-stamping machine is.

Ans. That is a machine for making an impression on the bottom of the sole or heel of a shoe.

Int. 1498. For ornamentation?

Ans. This impression may be of an ornamental character, but is more usually a trademark.

Int. 1499. Kindly state whether the button fly scalloping machine relates to treatment of uppers only.

Ans. It does.

Int. 1500. And heel seat beading machine relates to ornamentation?

Ans. I suppose the operation of that machine should be regarded as for the purpose of ornamenting the shoe, since the object of the operation is to improve the appearance of the shoe.

Int. 1501. Please explain briefly what the sole-gauging machine is.

Ans. I can state more definitely after recess.

Mr. CHOATE. Are you ready with your answer to the question, which was not answered, as to the sole-gauging machine?

The WITNESS. The sole-gauging machine of the Ross-Moyer Company was a machine for measuring and indicating to the operator the thickness of soles.

Int. 1502. Kindly state whether any patents were transferred by the Ross-Moyer Company to the United Company.

Ans. No, sir; the United Company acquired the stock of the

Ross-Moyer Company and the patents owned by that company remained in its possession.

Int. 1503. Does the Ross-Moyer Company now exist as a corporation?

Ans. Yes, sir.

Int. 1504. And I think you have heretofore testified that the officers of the Ross-Moyer Company are the same as the officers of the United Company?

Ans. I don't recollect whether I so testified.

Int. 1505. Do you know who the officers of the Ross-Moyer Company are?

Ans. No, I do not.

Mr. CHOATE. That was furnished by Mr. Donham to Mr. Gregg on one of the last days of the hearing, and is in the record somewhere. The Ross-Moyer Company is one of the defendants, you know.

Int. 1506. Kindly state whether the machines referred to in your answer to question 1134, on page 710, were manufactured and put out by the Ross-Moyer Company at the time of the acquisition of the stock of that company.

Ans. Yes, sir; all of those machines were being put out by the Ross-Moyer Company at the time the United Company acquired the stock of that company.

Int. 1507. I note the contract is dated September 20, 1900. Kindly state for how long a time, if you are able to tell, the Ross-Moyer Company were putting out the machines referred to in the previous question prior to the date of the contract.

Ans. The several machines had been put out by the Ross-Moyer Company for periods varying approximately with the dates of the respective inventions which were embodied in the machines.

Int. 1508. You have no record of the dates of the inventions, I assume?

Ans. The inventions were presumably made prior to the dates of the patents granted upon them.

Int. 1509. Then is it fair to say that the buffing machine was put out as early as April 29, 1890?

Ans. It was probably put out at about that time, or as soon after that date as a commercial machine could be constructed.

Int. 1510. Does the same answer apply to the bottom-stamping machine, the date of the patent of which is September 30, 1890?

Ans. I think that machine was put out at about that date or soon after.

Int. 1511. I note that you state that the embossing machine is covered by a patent dated December 2, 1890. Is it your understanding that the machines were put out at about that time?

Ans. I think so.

Int. 1512. I note that the patent as stated by you on the edge-setting machine is dated August 23, 1887. Is it your understanding that edge-setting machines were put out by that company at that date?

Ans. If you desire to know the dates at which the various machines were put out, I can ascertain them for you and would prefer to get the exact dates rather than to state them from memory.

Int. 1513. Will you kindly do so and testify to the facts inquired about at the next session?

Ans. I may be obliged to write to Cincinnati to get the information, but if available in Boston I will procure it before the next session.

Int. 1514. If you can state the dates approximately at the present time, I will be quite content.

Ans. I can really only guess at them, as I had no occasion to carry the dates in mind.

Int. 1515. Referring now to the Bay State International Shoe Machinery Company, Exhibit 86, you refer as I understand it to welting, stitching and rough-rounding machines, the reference being on page 710, cross-interrogatory 1135 and following. Kindly state whether those machines were the subject of United States patents.

Ans. I am prepared to give you the data of the British patents which were owned by the Bay State International Shoe Machinery Company. So far as I am advised, that company owned no United States patents.

Int. 1516. Kindly give the data of the foreign patents referred to by you.

Ans. The British patents of the Bay State International Shoe Machinery Company were as follows: 20,544 of 1897, dated September 7, 1897, —

Int. 1517. Give the title, if you will, Mr. Howard.

Ans. "Improvements in sewing machines for the manufacture of boots and shoes"; the machine of this patent was a chain stitch machine. No. 15,309 of 1898, dated July 12, 1898, improvements in waxed thread sewing machines. This machine was a chain stitch machine, and the patents covered the welting machine of the Bay State International Company. No. 24,853 of 1898, dated November 24, 1898, improvements in thread tension devices for sewing machines. This patent covered the welting machine of the Bay State International Company. No. 263 of 1899, dated January 5, 1899, improvements in sewing machines for use in the manufacture of boots and shoes. This machine covered the stitcher of the Bay State International Company.

Int. 1518. Was that a lockstitch?

Ans. The outsole lockstitch machine of the Bay State International Company, No. 4600 of 1899, dated March 2, 1899, improvements in stitch supporting and indenting machines for use in the manufacture of boots and shoes. No. 4645 of 1899, dated March 2, 1899, improvements in sewing machines for use in the manufacture of boots and shoes. This patent covered the outsole lockstitch machine of the Bay State International Company. No. 5952 of 1899, dated March 18, 1899, improvements in sole rounding and channeling machines. This company also owned certain French patents corresponding to the British patents above enumerated.

Int. 1519. Kindly state whether, so far as you know, the machines built under the patents referred to by you in the last answer went into extensive use in any country; and, if so, in what countries.

Ans. There were about ten sets of the machines put out in England.

Int. 1520. But none, so far as you know, put out in the United States?

Ans. My previous answer is the extent of my knowledge on the subject.

Int. 1521. To return briefly to the peg wood matter, kindly state whether, so far as you know, there was any concern putting out peg wood at the time the United Company acquired the peg wood interests of the Sturtevant Company.

Ans. At that time peg wood was being manufactured and sold by J. C. Lewis, of Orono, Maine, and by the United States Pegwood & Shank Company, of Charlestown.

Int. 1522. Do you know whether the concerns referred to in your answer are now in business?

Ans. I do not. My inquiry which produced this information was directed to conditions at the time of the Sturtevant acquisition as requested by you yesterday.

Int. 1523. Kindly state whether you have illustrations of the machines of the Bay State International Company to which you have made reference in your testimony.

Ans. Not except as they are illustrated in the drawings of the patents to which I have referred.

Int. 1524. Referring to the acquisition from the Stanley Manufacturing Company, you referred in your testimony on cross-examination, on page 711, to channeling machines. Kindly state whether you have an illustration of the type of channeling machine which was being manufactured by the Stanley Company at the time of the acquisition of the assets of that company by the Uninted Company.

Ans. The assets of the Stanley Manufacturing Company were not acquired by the United Company.

Int. 1525. In answer to cross-interrogatory 141, on page 711, I understand you to say that one of them, for channeling insoles, and another a combined rough rounder and channeler for trimming the edge of the sole of a Goodyear shoe, and at the same time forming the channel to receive the outsole stitch, were put out by the United Company. Kindly state whether they were put out in the United States.

Ans. The United Company was putting out in the United States

machines for channeling insoles for welt shoes and machines for simultaneously rough rounding and channeling the outsoles of welt shoes.

Int. 1526. Kindly state whether the machine referred to by you for rough rounding and channeling is illustrated in the catalogue of the United Company of 1902; and, if so, point out the page or pages.

Ans. The rough rounding and channeling machine put out by the United Company in 1902 is illustrated on page 18 of the 1902 catalogue.

Int. 1527. Kindly state whether the rounding and channeling machine illustrated on page 18 of the catalogue referred to and described on page 19 is constructed as set forth in any of the patents purchased by the United Company of any other company.

Ans. I am not aware that that is the fact.

Int. 1528. Are you willing to state whether the machine illustrated on page 18 of the catalogue and referred to on page 19 as the "Goodyear Universal Rounding and Channeling Machine" is constructed in accordance with the descriptions and drawings of any patent?

Mr. CHOATE. I think I will record my objection to that question because it is not open to anything on cross-examination, and I will ask the witness not to answer it.

The WITNESS. Under instruction of counsel, I decline to answer that question.

Mr. WEBSTER. The attention of the court is respectfully called to the fact that, while Mr. Howard is a witness produced by the United States, he declines to answer because of instructions from counsel for the defendants.

[*Counsel for the United States offers in evidence the cut identified by the witness and found on pages 18 and 19 of the catalogue of 1902. Cut on pages 18 and 19 marked "Plaintiff's Exhibit 197".*]

Int. 1529. You referred in your cross-examination, page 711, to a leveling machine, the same being a patented device procured from Winkley and Phillips which you afterwards developed into the Atlas leveler. Kindly state whether the Atlas leveler referred

to by you is illustrated in the catalogue of 1902; and, if so, kindly give the page.

Ans. I do not find the Atlas leveling machine in the index of this catalogue.

Int. 1530. Kindly state what you mean by the term "afterwards developed into the Atlas leveler".

Ans. I mean that the inventions acquired from Winkley and Phillips were experimented upon and developed, with the addition of other inventions, into a machine which was suitable for commercial use, and was put out for commercial use.

Int. 1531. Are you willing to produce an illustration of the Atlas leveler?

Ans. Certainly.

Int. 1532. In the question referred to reference is made to the device's being a patented device, and on page 713 you say: "The patent which was the subject of that agreement was No. 627,034, June 13, 1889. Am not sure that there were not others." Kindly state whether since that time you have ascertained whether there were others; and, if so, give the name, date and title.

Ans. There was at least one other, No. 557,744, April 7, 1896, Winkley sole-laying machine.

Int. 1533. Can you state briefly how the Atlas sole-laying machine differed from the Star?

Ans. The Atlas was a direct pressure machine, so called, which applied the leveling pressure to the sole through an iron form which was formed to give the desired shape to the sole, and during the application of pressure by that form the shoe was supported against the pressure by an iron form or last inside of the shoe. That type of machine was adapted and used for McKay work. The Star leveling machine was of an entirely different type. In that machine the leveling pressure, very much lighter than applied by the Atlas machine, was applied by a roll which was rapidly vibrated to and fro for short distances over the portion of the shoe being operated upon at the time, and which was, by relative movement of the roll and the shoe, made to operate successively upon different portions of the sole. The pressure was applied to the

roll through a spring so that a yielding pressure was exerted upon the shoe.

Mr. CHOATE. Have you finished by stating to which kind of shoe the Star was adapted?

The WITNESS. I should have added that the Star machine was a very light machine and was adapted and used only for leveling turn shoes, which, owing to the fact that they have but one sole, require and will stand a less degree of pressure than other types of shoes.

Int. 1534. Among patents referred to by you as having been conveyed to the United Company, I invite your attention to the patent to Coy, sole laying and pressing machine, dated November 20, 1888, No. 393,216. Will you kindly examine the copy of that patent which I now hand you and state whether or not a machine constructed as set forth in the patent was ever made and put out to your knowledge?

Ans. That patent was owned by the Swain-Fuller Manufacturing Company, and the American Sole Laying Machine Company had a license under it. I believe that no claims in that patent read upon any machine put out by the United Company, although it is possible that claim three reads upon the commercial machine of the American Sole Laying Machine Company.

Int. 1535. Pardon me, but the inquiry did not go to the question of the claim; simply as to the question whether machines were made and put out, so far as you knew, constructed as shown in the patent. With this explanation, will you kindly answer the question?

Ans. I cannot recall that machines identically like the machine shown in the drawings of this patent were ever put out by the United Company.

Int. 1536. Do you recall that machines substantially the same were ever put out by the United Company or any of its predecessors?

Ans. I do not recall.

Int. 1537. I observe in answer to cross-interrogatory 1125, on page 713, relative to the Lincoln Sewing Machine Company agreement: "There were patents involved, but I have not a list of

them." Kindly state whether you now have a list of the patents referred to by you.

Ans. Yes, sir.

Int. 1538. Has it been spread on the record as yet?

Ans. I think not.

Int. 1539. Will you kindly let us have the list, taking care to give us the name of the patentee, the number, date and title?

Ans. The patents assigned to the Goodyear Shoe Machinery Company by the Lincoln Sewing Machine Company on November 18, 1897, were the following: No. 453,568, G. A. Stiles, dated June 2, 1891, sole sewing machine; No. 494,969, G. A. Stiles, dated April 4, 1893, shoe sewing machine; No. 545,625, Fowler and Warren, dated September 3, 1895, sewing machine; No. 560,-705, Fowler and Warren, dated May 26, 1896, welt guiding mechanism for sewing machines; 564,985, Fowler and Warren, dated August 4, 1896, sewing machine; No. 564,986, Fowler and Warren, dated August 4, 1896, shoe sewing machine; No. 577,217, E. A. Webster, dated February 16, 1896, sewing machine. On February 17, 1900, the Lincoln Company assigned to the Goodyear Shoe Machinery Company No. 634,850, Fowler and Warren, dated October 10, 1899, shoe sewing machine. That is all.

Int. 1540. Kindly state whether the patents referred to in your last answer relate to the type of machine known as the Lincoln sewing machine.

Ans. Yes, sir; although not all of them covered the machine of the Lincoln Company as it was constructed in November, 1897.

Int. 1541. Kindly state whether any of the patents referred to in your answer relate to construction shown in the machine known as the Goodyear welt and turn machine or the Goodyear rapid outsole lockstitch machine.

Mr. CHOATE. I should like an objection noted to that question as not opened by anything on cross-examination.

Ans. Under advice of counsel, I decline to answer the question.

Int. 1542. On page 713 of the printed record you, in answer to cross-question 1156, refer to patents on lasting machines and pulling-over machines acquired from the Seaver Process Lasting

Company. Kindly state whether machines constructed in accordance with the patents enumerated by you are being manufactured by the United Company at the present time.

Ans. No, sir.

Int. 1543. Kindly state whether such machines were ever manufactured by the United Company.

Ans. No, sir.

Int. 1544. Kindly state whether such machines were ever manufactured by any company so far as you know.

Ans. The Seaver toe and heel lasting machine was manufactured by the Seaver Company, and they also manufactured several experimental pulling-over machines, so called.

Int. 1545. In answer to cross-interrogatory 1158, on page 714, referring to the acquisition of property of the Globe Shoe Tool Company, you say: "I think they had no patents." Kindly state whether since testifying you have ascertained whether there were any patents involved in that transaction.

Ans. The Globe Shoe Tool Company owned no patents at the time of this acquisition.

Int. 1546. In answer to cross-interrogatory 1159, page 714, you referred to a patent relating to the Brewer improvement on heel breasting. Kindly state whether devices made under, and in accordance with, that patent were manufactured and put out by the United Company.

Ans. Yes, sir.

Int. 1547. State whether such machines are illustrated in the catalogue of 1902.

Ans. Yes, sir; that machine is shown on page 176 of the 1902 catalogue.

Mr. WEBSTER. The cut testified to by the witness offered in evidence, together with the printed matter on page 177, and marked "Plaintiff's Exhibit 198".

Int. 1548. Kindly state whether the machine illustrated on page 176 of the catalogue of 1902 is now being manufactured and put out by the United Company?

Ans. That machine, with some modifications, is still being manufactured and put out by the United Company.

Int. 1549. Will you kindly briefly state the modifications?

Ans. After approximately 700 of the machines had been put out incorporating the Brewer invention, an improved construction of mechanism for stopping the knife automatically in accordance with the thickness of the shank of the shoe was adopted. Other changes have been made in the machine from time to time.

Int. 1550. Will you kindly state, provided opposing counsel does not object to your doing so, whether the modifications referred to by you now form the subject-matter of United States patents?

Ans. These modifications are covered by patents or pending applications.

Int. 1551. Will you kindly give the number, date and title of the patents?

Ans. I have not the data at hand.

Int. 1552. Will you kindly produce it at some future time?

Ans. Yes, sir.

Int. 1553. Referring now to Edwin T. Freeman's machine, page 714, in answer to cross-interrogatory 1160 you refer to certain patents, and at the end of your answer you say: "He had some other patents." Kindly state whether the other patents referred to by you were transferred to the United Company; and, if so, kindly give us the number, date and title.

Ans. I believe there was only one patent transferred by Freeman which I did not name in cross-interrogatory 1160. This was patent No. 607,924, dated July 26, 1898, nailing machine.

Int. 1554. Kindly state whether machines made in accordance with the patents referred to in your answer to cross-interrogatory 1160 are now being made by the United Company.

Ans. Machines have been constructed and put out embodying the inventions claimed in the patents assigned by Freeman, but no machine exactly like the machines shown in the drawings of the Freeman patents named has been built by the United Company.

Int. 1555. If the machine referred to in your last answer is illustrated in the catalogue of 1902, will you kindly point out upon what page the same is found?

Ans. Those machines are not illustrated in that catalogue.

Int. 1556. Are they illustrated in any catalogue so far as you know?

Ans. This is the only general catalogue ever put out by the United Company.

Int. 1557. Are they illustrated in any printed matter put out by the United Company?

Ans. Freeman's inventions have been embodied in three different types of machines which the United Company has built either commercially or experimentally. One of these machines is "loose nailing machine No. 2", and I can furnish an illustration of that machine. I do not know whether illustrations of the other two machines are available.

Int. 1558. If you are able to do so, will you kindly produce them at the next session?

Ans. I will.

Int. 1559. Referring to the acquisition of the property of the Breach Manufacturing Company, you say, in answer to cross-interrogatory 1171, as I understand your reply, that the Breach Company had the exclusive license for a machine for cutting out soles, and you give the number and dates of certain patents. Kindly state which one of the patents referred to by you in that answer relate to the machine for cutting out soles.

Ans. No. 318,540 and No. 589,409 cover the machine of the Breach Company as it stood at the time of this transaction. I ought to add that the machine at that time embodied inventions on which applications for patents were applied after the date of this transaction. On these applications patents were granted as follows: No. 676,457, June 18, 1901, Breach, machine for cutting articles from sheet material, and No. 678,935, July 23, 1901, Breach, machine for cutting articles from sheet material.

Int. 1560. Was the Breach machine for cutting out soles manufactured and put into use by the Breach Company?

Ans. By the Breach Company?

Int. 1561. Yes, the Breach Manufacturing Company.

Ans. A small number of machines of earlier types had been put

out by the Breach Company or by Breach personally before the date of this transaction.

Int. 1562. Were the machines made and put out by the United Company after the transaction referred to?

Ans. The United Company built experimental machines and put them out on trial but could not interest manufacturers to use them.

Int. 1563. Then, is it fair to say that machines made under the patents referred to are not such as are known as a commercial success?

Ans. Yes, sir.

[*Adjourned to 10* A. M., *July 17, 1913.*]

BOSTON, MASS., July 17, 1913.

Int. 1564. Kindly state whether you have any more of the data you were requested to produce and which was not convenient for you to produce yesterday.

Ans. I have some of the information here but not all. If equally convenient, I will present it all tomorrow morning, excepting the dates when the Ross-Moyer machines were first put out, for which information I must send to Cincinnati. I have already written for it.

Int. 1565. Kindly state whether you are able now to produce a cut of the Atlas leveling machine requested yesterday.

Ans. I can and do produce such a cut.

Mr. WEBSTER. Cut produced by the witness put in evidence and marked "Plaintiff's Exhibit 199".

Int. 1566. Referring to the affairs of the Goddu Sons Metal Fastenings Company mentioned on page 715 of the printed record, you refer to certain patents. Kindly state whether to your knowledge the loose nailer referred to by you in answer to question 1172 was manufactured and put out by the United Company or any of its affiliated companies.

Ans. It was not, so far as I am aware.

Int. 1567. Kindly state whether the rapid screw machine referred to in the same answer was put out by the United Company or any of its affiliated companies.

Ans. It was not, so far as I know.

Int. 1568. Kindly state whether the slugger referred to in the same answer was put out by the defendant or any companies associated with the defendants.

Ans. So far as I know, that was not put out.

Int. 1569. State whether the machine for making the string nail wire was put out by said companies, or either of them?

Ans. It was not, so far as I know.

Int. 1570. State whether the string nail wire referred to in that answer was put out.

Ans. So far as I know, it was not.

Int. 1571. And whether the machine for making the nail referred to in the answer was put out.

Ans. I think not.

Int. 1572. State whether the eight or ten patents referred to by you in answer to question 1174 were transferred to the United Company or any affiliated companies.

Ans. No, sir.

Int. 1573. I note you say in the answer: "We have obtained eight patents from them." Kindly explain what you mean by that statement.

Ans. That statement was erroneous and should be corrected. Of course, we did not obtain any patent from the Goddu Sons Metal Fastenings Company; that is, no patents were assigned to the United Company by the Goddu Sons Metal Fastening Company.

Int. 1574. The United Company did, however, as I recollect your testimony, acquire the stock of the Goddu Metallic Fastening Company?

Ans. Some of the stock.

Int. 1575. I note in answer to question 1173 you say, in referring to the patent: "There were some that I have not read that were not embodied in their machines." As you do not appear to have made reference to those particular patents, will you kindly give the date, title and number of such patent?

Ans. Two patents of the Goddu Sons Company I did not men-

tion were No. 583,047, May 25, 1897, W. Goddu, nailing machine, and 583,048, May 25, 1897, W. Goddu, nailing machine.

Int. 1576. Kindly state whether machines were made by the United Company or any affiliated company in accordance with the nailing machine patents referred to in your last answer.

Ans. Not so far as I know.

Int. 1577. In your answer to cross-question 1175, replying to the inquiry as to what patents were obtained from the Goddus themselves, you say: "There were ten patents altogether, of which I will note those first that were infringed by the machines of the Goddu Sons Metal Fastenings Company." Following this statement, you give the numbers and dates of certain patents. Kindly state whether you personally examined the machines of the Goddu Sons Metal Fastenings Company and compared the same with the patents enumerated by you.

Ans. In July, 1898, I spent about a week in examining the machines of the Goddu Sons Metal Fastenings Company. At the time I was examining these machines, or immediately after, I had drawings made illustrating the constructions of the respective machines, which drawings are still in my possession. With the aid of those drawings and notes made at the time, I am able to determine the exact construction of those machines. I have examined the patents mentioned by me in answer to question 1175 in drawings and notes to which I have referred, and my statement as to infringement of those patents named by me was based upon that examination. I should like to state that patent No. 614,460, which, as stated by me in that answer, was infringed by the Goddu Sons' loose nailer and the Goddu Sons' slugger, was also infringed by the Goddu Sons' string nailer.

Int. 1578. You say in answer to cross-interrogatory 1180, as I understand you, that there was litigation between the McKay Shoe Machinery Company and the Goddus, father and sons, and the Goddu Sons Metal Fastenings Company before the United Company came into existence. Kindly state what you mean by that statement. That is, were cases pending in court? If so, what cases? Were the cases for infringement, or on contract?

Ans. Before the formation of the United Company a suit had been brought against the Goddus, father and sons, and the Goddu Sons Metal Fastenings Company, in the name of the trustees of the McKay Metallic Fastening Association, James W. Brooks, principal trustee, and Frank L. Stanley, associate trustee, under the contract which Louis Goddu, the father of the sons, had entered into previously with the trustees of the Metallic Association. It was charged by the trustees of the Metallic Association that the inventions embodied in the machines of the Goddu Sons Company had been made by Louis Goddu, the father, —

Int. 1579. Pardon me. I do not care for all the details, but if you will tell me where the suit was pending?

Ans. — and this suit was brought to compel the transfer of these inventions to the Metallic Association. Prior to the formation of the United Company no infringement suits had been actually instituted, but bills of complaint and affidavits had been prepared and printed in support of motions for preliminary injunction.

Int. 1580. Kindly state in what court the action referred to by you, to compel transfer of inventions of patent, was brought.

Ans. I think it was in the Circuit Court, but I will verify that, if you desire.

Int. 1581. Kindly do so, and give the number of the case and the date when the bill was filed, if convenient. In your answer to cross-question 1175 you say the tacking machine of the Goddu Metal Fastenings Company was covered by patent 584,735, of June 15, 1897, and I understand you to say that you examined the tacking machine referred to. Kindly state whether the tacking machine was in operation or set up for operation at the time you examined it, and for how long a time, if you know, it had been in operation.

Ans. I examined this machine in the small machine shop adjacent to the residence of Louis Goddu, the father, in Winchester. The machine was in such condition that it could be turned over by hand or by power if desired.

Int. 1582. And had this type of machine been manufactured by

the Goddu Sons Metallic Fastenings Company prior to the time you examined it, as referred to by you in your last answer?

Ans. The particular machine which I examined at Winchester had, I understood, been constructed in that machine shop where I saw it.

Int. 1583. Then is it true that so far as you know the Goddu Company had not manufactured and put out the tacking machine of the type examined by you?

Ans. They had not put out any tacking machines.

Int. 1584. Then is not your statement in error that the tacking machine of the Goddu Metal Fastenings Company infringed the patent referred to by you, in view of the fact that no machines had been made or put out?

Ans. The machine which I saw, if made after June 15, 1897, the date of the patent No. 584,735, which date was more than a year before I saw the machine, constituted an infringement of that patent by the act of manufacture. However, it is of course a fact that the machine could not after June 15, 1897, be either made or used without infringing that patent.

Int. 1585. I understood you to say that patent 584,735 on the tacking machine was procured by the United Company from the individuals. I also understood you to say that the tacking machine you examined was made by the individuals from whom the United Company procured the patents. Kindly state if I am correct in my understanding.

Ans. I do not now recall that I stated by whom the machine of patent No. 584,735 which I saw had been constructed.

Int. 1586. Kindly state whether the tacking machine made under patent 584,735 was manufactured and put out by the United Company or any of its affiliated companies after the patent on that machine was acquired.

Ans. No, sir; it was not.

Mr. CHOATE. I am not a bit clear about that patent 584,735. It is not mentioned in your cross-examination.

The WITNESS. The first line at the top of page 716.

Mr. CHOATE. When you say "the tacking machine of the company" do you mean of the Goddu Company?

The WITNESS. Yes. That company had been named in the preceding line.

Int. 1587. Kindly state if you know whether the loose nailer referred to by you on page 716, in answer to question 1175, was made and put out by the Goddu Company.

Ans. Certainly one machine had been made, — the one which I examined, — but no machines were ever put out by the Goddu Sons Company.

Int. 1588. Kindly state whether the loose nailer examined by you, referred to in your last answer, was operative.

Ans. The machine could be turned over. I assume that answers your question.

Int. 1589. Do you mean you did not see it in operation?

Ans. I did not see it operating upon shoes. I don't know that it was ever used in the actual manufacture of a shoe.

Int. 1590. Kindly state whether the United Company, after acquiring the patent covering the loose nailer referred to, manufactured and put out loose nailers of that type.

Ans. I believe you have already inquired as to that, but I will state again that, so far as I know, it did not.

Int. 1591. Kindly state whether the slugger referred to by you in answer to question 1175 was manufactured and put out by the Goddu Company.

Ans. It was never put out by the Goddu Company.

Int. 1592. Was it ever put out by anyone, so far as you know?

Ans. No, sir.

Int. 1593. Will you kindly state whether the string nail wire referred to by you in answer to question 1175, which you say was broadly covered by patent 641,099, was made and put out by the Goddu Company or by any other company?

Ans. Not so far as I know.

Int. 1594. Kindly state whether the screw-threaded wire referred to by you in the same answer was manufactured and put out by the Goddu Company or by any other party.

Ans. The Goddu Sons' screw machine was tried in one shoe factory, and I understand that this wire was supplied for use on that machine, but I don't understand that it was sold, as this use to which I refer was purely experimental.

Int. 1595. Did the United ever put out the fastening material referred to by you in your last answer?

Ans. That fastening material was very similar to the old standard screw wire formerly put out by predecessors of the United Company, and possibly to a very limited extent by the United Company after March, 1899.

Int. 1596. Will you kindly explain just what you mean in your last answer in making reference to "the old standard screw wire"? That is, whether a machine known as the old standard screw machine was manufactured and put out by the United Company, or any of its predecessors, in which such wire was used?

Ans. The old standard screw machine was the machine which —

Mr. CHOATE. Mr. Howard, the question is as to wire and not as to the machine.

The WITNESS. The latter part of the question is as to the machine.

[*At the request of Mr. Choate the question was repeated by the stenographer.*]

Mr. CHOATE. I object to that question as leading, and not opened by anything on cross-examination.

Mr. WEBSTER. And you instruct the witness not to answer?

Mr. CHOATE. No. But why don't you really just ask for an explanation as to what "old standard screw wire" means?

Mr. WEBSTER. He knows what we want. It is desirable to make the record as short as possible, and it seems to me he might explain it and do away with the necessity of a vast number of questions.

Mr. CHOATE. Why don't you just ask him what he means by standard screw wire?

Int. 1597. In view of the suggestion of opposing counsel, I will not at the present time insist on an answer to the question, but will ask you to explain what you mean by standard screw wire.

Ans. The old standard screw wire to which I referred was a wire having a single thread.

Int. 1598. Will you now state when the old standard screw wire having a single thread first went into use, so far as you know, and in what machine it was employed?

Mr. CHOATE. I desire to note my objection to the question as immaterial and not opened by anything on cross-examination, the standard screw wire having simply been used as an illustration by the witness. I instruct the witness not to answer the question until directed to do so by the court.

The WITNESS. Under advice of counsel, I decline to answer that question.

Int. 1599. Are you willing to state when the material termed by you "old standard screw wire" first went into use?

Ans. I cannot give the exact date, but it was certainly more than twenty years ago.

Int. 1600. Are you willing to state whether the United Company or any of its predecessors made and put out a machine adapted to use the wire termed by you "old standard screw wire"?

Ans. The predecessors of the United Company put out such a machine.

Int. 1601. Are you willing to give the commercial name of the machine referred to in your last answer?

Ans. For many years it has been known as the "old standard screw machine".

Int. 1602. Are you willing to state what company made and put out the machine termed by you as the "old standard screw machine"?

Ans. The McKay Metallic Fastening Association put that machine out.

Int. 1603. Are you willing to state when, so far as you are able to state, the "old standard screw machine" was first put out approximately?

Ans. I cannot state it from memory.

Int. 1604. Kindly state whether the United Company ever put

out a machine adapted to accomplish the same result as the machine referred to by you as the "old standard screw machine".

Ans. The United Company has put out a machine for attaching the outer sole of a shoe by means of a screw of threaded wire.

Int. 1605. By the last answer do you wish to be understood as saying that the machine put out by the United Company is adapted to accomplishing the same result as the machine referred to by you as the old standard screw machine?

Ans. I should prefer to accompany my answer to that question by a somewhat detailed explanation of the essential differences between the machine of the Goddu Sons Company and the machine of the United Company. It seems to me that my previous answer is sufficient.

Int. 1606. In your answer to question 1175 you say "there were a number of other patents". I do not recollect that you have specified what these "other patents" were. Will you kindly give the number, date and title?

Ans. The patents not mentioned by me in my answer to question 1175, which were assigned by the individuals to the United Company, were: No. 569,152, October 6, 1896, W. Goddu, tacker; No. 572,538, December 8, 1896, N. and G. Goddu, sewing machine; No. 592,702, October 26, 1897, N. and G. Goddu, sewing machine for lasting boots or shoes; No. 595,878, December 21, 1897, W. Goddu, nailing machine. There were also assigned applications, serial No. 597,027, filed June 26, 1896, which matured into patent 745,819, December 1, 1903, W. Goddu, sewing machine; application serial No. 689,656, filed October 27, 1898, which matured into patent No. 950,693, March 1, 1910, G. Goddu, pegger.

Int. 1607. Will you now kindly state briefly whether any machines or devices made in accordance with the construction set forth in the patents referred to by you in your last answer were ever made or put out by any person, firm or corporation?

Ans. In the cases of some of these patents some steps were taken before March, 1899, toward the construction of machines, but most, if not all, of the machines were never completed. As to No. 950,693, March 1, 1910, the United Company constructed sev-

eral experimental pegging machines in which some of the inventions claimed in the application for that patent at the time of its acquisition were embodied.

Int. 1608. Kindly state whether the United Company are now putting out or ever have put out a machine known commercially as the Chase laster.

Mr. CHOATE. That is not opened on the cross-examination, Mr. Howard. I think I will interpose an objection and ask the witness not to answer.

Ans. Under advice of counsel, I decline to answer.

Mr. WEBSTER. The question is merely preliminary. It seems to counsel for the Government fair that the witness should answer. Counsel reserves the right to pray the judgment of the court.

Int. 1609. Referring again to the matter of the litigation to which you have made reference as between the Goddu Company and the McKay Company, you have referred to one suit. Kindly state if that is all the litigation, so far as you know, between the companies referred to and to which you made reference in cross-examination.

Ans. But one suit had actually been instituted, although, by my answers to questions 1180 and 1181, I doubtless had in mind proposed infringement suits which were about to be instituted, but which had not actually been begun before March 24, 1899.

Int. 1610. State, if you know, what patents were relied upon as foundation for the proposed litigation for alleged infringement in the proposed suits referred to by you.

Ans. These patents were as follows: No. 265,227, September 26, 1882, Goddu, machine for driving sole fasteners; No. 403,835, May 21, 1899, Goddu, machine for uniting soles to uppers; No. 289,103, November 27, 1883, Hopkins, nailing machine; No. 356,-107, January 18, 1887, Dunham, boot or shoe nailing machine; No. 383,455, May 29, 1888, Goddu, nailing machine; No. 385,802, July 10, 1888, boot and shoe nailing machine; No. 493,910, March 21, 1893, Cummings and Coupal, pegging machine; No. 563,-478, July 7, 1896, nailing machine; No. 490,625, January 24, 1893, nailing machine.

Int. 1611. Am I to understand you to say that bills of complaint for infringement of all the patents narrated by you in the last answer were prepared?

Ans. Yes, sir.

Int. 1612. Will you kindly state who was the complainant or complainants and defendant or defendants in these several proposed causes?

Ans. James W. Brooks, principal trustee, and Frank S. Stanley, associate trustee, of the McKay Metallic Fastening Association, were, I believe, the complainants in each of the proposed suits, and the Goddu Sons Metal Fastenings Company was the defendant. I am not certain now whether any individuals were joined as defendants.

Int. 1613. Is there any of that data called for that you could get right away if we had a recess?

Ans. I have it here. In five minutes I could probably get it so as to give it to you. I have some of it here. What I have I could probably give you.

Int. 1614. Give us what you can at the present time, and then if it requires a little time we may take a little longer recess so as to give you time to look it up.

Ans. You inquired at a previous session whether any Globe lock-stitch welters had been put out by the United Company. So far as I can ascertain, none were put out by the United Company. You asked me to produce an illustration of the twin sole-laying machine, and I now produce it. The name on this cut is "Goodyear Improved Sole Laying Machine". This machine is a development of the two-form sole-laying machine previously known as the "Goodyear Improved Twin Sole Laying Machine".

The EXAMINER. That will be marked "Plaintiff's Exhibit No. 200".

The WITNESS. There is still some information that I have not here but can give you later.

Mr. WEBSTER. Now, Mr. Choate, I cannot finish until he gives me the bulk of the data and information called for, which he kindly agreed he would furnish; and do you want to go ahead, allowing

me to stop now and you go ahead and then I take up the other matters later?

Mr. CHOATE. Now, what are the things he has not given?

Mr. WEBSTER. I don't know. I may have inadvertantly forgotten something. I want to save all the rights I am entitled to.

Mr. CHOATE. Does that complete all the things you have thought that he asked for?

The WITNESS. No. He wished me to obtain cuts showing the successive stages in the development of the Amazeen skiving machine and to give information about the patents on that machine in its successive stages.

Mr. CHOATE. Is that important?

Mr. WEBSTER. No. I do not consider it of large importance. I cannot tell until after I see it. The probability is that I would not take but a few minutes.

Mr. CHOATE. If you really wanted to have that followed up, I should think it would take some time to look it up.

The WITNESS. I think I have that in my office in fair shape.

Mr. CHOATE. You can have that this afternoon?

The WITNESS. Yes.

Mr. CHOATE. What else?

The WITNESS. Mr. Webster asked me to furnish a list of the patents and applications on inventions embodied in the —

Mr. WEBSTER. There is one patent I referred to yesterday which I intended to introduce. I do not think I introduced it. I cannot tell what particular one it was until I look at the record. Is there any objection to my putting it in later?

Mr. CHOATE. I would like to wait and see what it is before I decide. I will not object to your presenting it later.

The WITNESS. In the power heel-breasting machine shown on page 176 of the 1902 catalogue to which I referred yesterday in connection with the discussion of the Brewer patent.

Mr. CHOATE. Have you got those now?

The WITNESS. No. I asked for those about five o'clock last evening and requested that they be furnished me by 9.30 today, but I did not get them. They are probably ready now.

Mr. CHOATE. That is two things. Now, what else?

The WITNESS. The dates when the Ross-Moyer machines were introduced I cannot have before the first of next week, as that information must come from Cincinnati. This morning I was asked for the data of the suit brought by the trustees of the McKay Metallic Fastening Association against the Goddus.

Mr. CHOATE. Are there any inventions asked for?

The WITNESS. I was not asked that. That is in connection with the proposed patent infringement suit, wasn't it?

Mr. CHOATE. Does that cover everything?

The WITNESS. That covers everything except cuts of some machines which I referred to in connection with the discussion of the Freeman patents.

Mr. CHOATE. Then, outside of the subjects Mr. Howard has just enumerated, you have completed your re-examination?

Mr. WEBSTER. Unless I think of something else that I inadvertently omitted. I think now of one matter that I should like to touch upon briefly.

Int. 1615. You have testified in cross-examination with reference to litigation concerning the eyelet patents. My recollection is that you have not specified what suits were brought, upon what patents they were brought or who the complainants and defendants were. If you have this data, will you kindly spread it on the record at the present time?

Ans. I have now at hand data as to the following suits: Equity No. 1013, Enamel Eyelet Company of Maine *v.* John C. Rhodes, bill filed August 1, 1898, for infringement of design patent 24,867, November 12, 1895, Kempshall; Equity No. 1085, John C. Rhodes, et al. *v.* Lucius Beebe & Sons Company, bill filed November 5, 1900, for infringement of patent 565,091, August 4, 1896, Rhodes. This suit was against a user of the enamel eyelet put out by the Enamel Eyelet Company; Equity No. 1543, new series, J. C. Rhodes & Company, Inc. *v.* Morley Button Manufacturing Company, bill filed October 29, 1901, for infringement of patent 565,-091, August 4, 1896, Rhodes. Equity No. 1544, new series, J. C. Rhodes & Company, Inc. *v.* Morley Button Manufacturing Com-

pany, bill filed October 30, 1901, for infringement of design, patent 24,867, November 12, 1895, Kempshall. Those are all the suits that I have notes of before me.

Int. 1616. State, if you know, how the cases were disposed of.

Ans. The suits Equity No. 1013 and 1285 had not been prosecuted to a final hearing before the acquisitions of the Enamel Eyelet Company and J. C. Rhodes & Company. After these acquisitions, the suits were settled amicably.

Int. 1617. Do you know what the entry was?

Ans. In the former, the entry was: "Bill dismissed by consent." In the latter the entry was: "Bill dismissed", according to my notes. In Equity No. 1543 and Equity No. 1544, the suit brought by the Rhodes Company against the Morley Company, both bills were dismissed without prejudice and without costs in accordance with the agreement to that effect contained in the instrument dated December 4, 1901, to which the United Shoe Machinery Company and the Morley Company were parties, that agreement being the one which was made at the time of the acquisition of the Morley Company's eyelet patents by the United Shoe Machinery Company.

Mr. CHOATE. In other words, all this litigation continued until matters were finally composed by the acquisition of the companies?

The WITNESS. Yes; and settlement of the litigation between the Rhodes Company and the Morley Company was set forth in the agreement as one of the objects of the transaction.

Mr. WEBSTER. Would you rather we adjourned until two o'clock and let me see what else I want to put in, or let me pick up the tag ends afterwards?

Mr. CHOATE. I should like to use up the time, if agreeable, in recross and then let you complete anything you have at two o'clock.

Mr. WEBSTER. That is quite agreeable to me.

Mr. CHOATE. I mean if it is agreeable to everybody, as long as we have given up this time, to let us use it to the best advantage and get through.

Mr. WEBSTER. I am quite content. Of course, as I have said before, if I have omitted anything I want to save the right to put it in.

Cross Examination by CHARLES F. CHOATE, Jr., Esq., *of Counsel for Defendants.*

Cross-Int. 1618. The suit brought by Brooks and Stanley, trustees, against the Goddu Sons Company had been running for some little time before the stock of the Goddu Company was bought by the United Company, had it not?

Ans. Yes, sir.

Cross-Int. 1619. A good deal of testimony had been taken?

Ans. A very large amount.

Cross-Int. 1620. And the claims of the McKay Metallic Fasten ing Association developed and substantiated before the stock was purchased by the United Company?

Ans. Yes.

Cross-Int. 1621. As you have been asked about the subject of litigation and the character of the charges, I will ask you if you will kindly produce and attach to your deposition a copy of the bill filed in Brooks and others against Goodu Sons?

Ans. I will do so.

Cross-Int. 1622. You referred to a bill or bills of complaint which had been prepared, supported by affidavits, based upon the alleged infringement of the McKay Metallic Fastening Association by the Goddus, or by the Goddu Sons Company, and you have been asked also about the character of those complaints. I will ask you if you will produce a copy of that bill or bills, with the affidavit of James W. Brooks in support of it, and attach it to your deposition?

Ans. I shall be glad to. I will add, however, that there were other affidavits.

Cross-Int. 1623. I understand that the other affidavits related particularly to technical matters.

Ans. Yes.

Cross-Int. 1624. In brief, the substance of the quarrel between the Metallic Fastening Association and the Goddus was this, was it not: that Louis Goddu had been employed by the Metallic Fastening Association a good many years and had invented more

or less machinery; they made contracts with him, and from time to time they claimed he had broken them and they had been forced to make new ones; they could not get him to abide by his agreements with them; they had taken his sons into their employ, had gone to Winchester and built a factory at his desire, and then some difference had arisen as to who should be superintendent of that factory, and one by one the Goddu Sons had left the employment of the Metallic Fastening Association; Louis Goddu had opened a little shop in which his sons were working; patents were being taken out ostensibly in the names of the sons which the trustees of the Metallic Fastening Association charged were really the inventions of Louis Goddu, which were being taken out in the names of his sons to conceal their real origin, and a suit was brought to compel a transfer of those patents taken out in the names of the sons to the company as being inventions really made by Louis Goddu? In substance, that is the statement of the quarrel, isn't it?

Mr. WEBSTER. Question objected to as entirely improper, more in the nature of argument than inquiry.

Mr. CHOATE. Well, if you object to that statement of it I will withdraw it. I will not press it. I thought it a convenient summary of the situation.

The EXAMINER. Does it all go out?

Mr. WEBSTER. I think I ought to object to it. I do not believe it is fair to argue the case on the record that way.

Mr. CHOATE. Well, if you really object, I will withdraw it. I think you will find on examination of the papers it is a fair summary of what they charge.

The EXAMINER. Do you desire it stricken from the record? If Mr. Webster consents, strike it from the record.

Mr. WEBSTER. Let it stay as it is, and the record shows it is withdrawn.

Cross-Int. 1625. Mr. Howard, I take it that your catalogue referred to as the catalogue of 1902 is not necessarily a complete description of all machines of the United Company, is it?

Ans. At that time or now?

Cross-Int. 1626. Well, either then — of course not now.

Ans. That is true.

Cross-Int. 1627. From time to time as machines were developed, single sheet illustrations of them were prepared if desired for the trade?

Ans. That is so.

Cross-Int. 1628. The fact that a machine does not appear in the catalogue is not necessarily conclusive that it was not being offered to the trade by the United Company at that time?

Ans. That is correct.

Cross-Int. 1629. With reference to the Atlas leveler, of which you produced a cut this morning, Exhibit 199, had that been developed at the time of the compilation of the catalogue of 1902?

Ans. No, sir.

Cross-Int. 1630. The cut which you offered as Exhibit 199 was then prepared for distribution, I take it, some time afterwards?

Ans. Yes, sir.

Cross-Int. 1631. Did the United Company, embodying the ideas obtained from Winkley and Phillips in the Atlas leveling machine, manufacture and offer the machine to the trade?

Ans. Yes, sir.

Cross-Int. 1632. And was it put out to a large extent?

Ans. Yes, sir; about five hundred of them were put out.

Cross-Int. 1633. And which accommodation to the trade has continued, has it not, ever since?

Ans. Yes, sir; continuously.

Cross-Int. 1634. And they are still in use and still offered to the trade?

Ans. Yes; and still being put out.

Cross-Int. 1635. With reference to the Breach machine, was every assistance afforded by the United Company to Breach in an endeavor to make commercial the idea embodied in his alleged invention?

Ans. Every possible assistance.

Cross-Int. 1636. And work was continued on it for quite a long time?

Ans. Nearly or quite two years, as I remember it.

Cross-Int. 1637. A good deal of money spent on it?

Ans. A large amount.

Cross-Int. 1638. And the result was that a machine could not be produced which was acceptable to the shoe manufacturers?

Ans. That was the result.

Cross-Int. 1639. They could not be interested in it?

Ans. No, sir.

Cross-Int. 1640. And that was the occasion for cessation of efforts in putting out or attempting to put out any Breach machine?

Ans. That, accompanied by a development in trade conditions in which you may not be interested.

Cross-Int. 1641. You may briefly mention it.

Ans. Shortly before the time of the acquisition of the Breach patents, sole-rounding machines of the so-called Stanley and Julian type were introduced, which used a wooden pattern instead of a metal pattern such as had been previously used in sole-rounding machines, and as was used in the Breach machine. That pattern cost but a small fraction of the cost of the metal pattern, and was a very great improvement because it obviated the necessity of lubricating the edge of the pattern, which had always presented a serious difficulty.

Cross-Int. 1642. The Bay State International Shoe Machinery Company manufactured its machines, if any, where?

Ans. In Montreal, Canada.

Cross-Int. 1643. None in this country, so far as you know?

Ans. None whatever.

Cross-Int. 1644. What do you say with respect to the comparative merits of those machines as compared with those for performing the same or similar operations upon which the United Company was then at work? Did they develop as excellent qualities?

Ans. These machines were distinctly inferior to machines being put out by the United Company at that time. I am prepared, if desired, to explain in detail the inferiority and defects of the machines of the Bay State International Company.

Cross-Int. 1645. I won't ask you to go into detail, but these

machines were ones which you stated were patented in Great Britain and in France?

Ans. Yes, sir.

Cross-Int. 1646. The machines of the United Company, to which you say they were inferior, were patented in the United States, were they?

Ans. Yes, sir; and also abroad, of course.

Cross-Int. 1647. But the Bay State Company did not have United States patents?

Ans. No, sir; the Bay State International Shoe Machinery Company owned no United States patents.

Cross-Int. 1648. Their Canadian or British patents required them, if they desired to retain the patents, to manufacture in those countries?

Ans. The Canadian patent law required manufacturing in Canada, and the French patent law in France. At that time the manufacture was not required under British patents.

Cross-Int. 1649. It was later, was it not?

Ans. Yes.

Cross-Int. 1650. Calling your attention to the fact that among the matters involved in the transaction with the Seaver Process Lasting Company were certain inventions on pulling-over machines, have the inventions acquired from the Seaver Process Lasting Company been embodied in pulling-over machines which have been perfected and put out by the United Shoe Machinery Company or the ideas embodied in the inventions?

Ans. Yes, sir; and the mechanism embodying those features is of the utmost importance in that machine.

Cross-Int. 1651. The Seaver Company did not have any commercial machine at the time of the transaction, did it?

Ans. They had only an experimental machine.

Cross-Int. 1652. And there was not any commercial machine in the market at that time?

Ans. No, sir.

Cross-Int. 1653. And it was a combination of the ideas involved in the Seaver patents with those upon which your own people were

working that resulted in the present commercial pulling-over machine?

Ans. Yes, sir.

Cross-Int. 1654. Were the lasting inventions obtained from the Seaver Company as useful and as beneficial as it was hoped and expected that they would be at the time of the purchase? Did they develop so?

Ans. No, sir; there was no demand from shoe manufacturers after the purchase of the Seaver patents for the Seaver lasting machine.

Cross-Int. 1655. Was it found practicable to adopt or incorporate any of the features of the Seaver machine in machines which were desired by shoe manufacturers?

Ans. It was not, as the corresponding features in the United Company's machines were in each instance superior.

Mr. WEBSTER. Answer objected to as an expression of opinion rather than a statement of facts.

Cross-Int. 1656. You have been asked if in certain cases machines as described in a particular patent have been put out by the United Company. I will ask you whether it has not usually been the case that where patents have been acquired and the character of those patents has been studied and worked over, ideas or parts of ideas or suggestions have been developed from them which, if practicable, have been embodied in machines which have been put out by the United Company?

Mr. WEBSTER. Objected to as calling for an opinion, having reference to no particular matter referred to in the redirect examination.

Ans. That has been true in nearly every case.

Cross-Int. 1657. And is it not true that in all the cases so far as you have knowledge, and of which you have been asked in redirect examination, an effort has been made in good faith to do something with the ideas or patents acquired, and so far as they have developed novel or useful features, those have been put to practical use?

Mr. WEBSTER. The same objection, that it calls for an opinion,

having reference to no particular matter referred to in the redirect examination.

Ans. That is true.

Cross-Int. 1658. And where they have been in whole or in part rejected or not used, it has been because study and experiment has developed the fact that they were not practicable or were inferior to those machines which the art had already developed?

Mr. WEBSTER. The same objection, that it calls for an opinion, having reference to no particular matter referred to in the direct examination.

Ans. That has been true in every instance where the inventions acquired were not put into practical use.

Mr. CHOATE. That is all. Now, we have got fifteen minutes. If Mr. Howard could be excused he could get his material together and be ready at two o'clock to supply what Mr. Webster wants.

Mr. WEBSTER. You are through with your cross-examination?

Mr. CHOATE. Yes, except so far as you open up other subjects.

The EXAMINER. Then we will suspend until two o'clock.

Cross-Int. 1659. You now produce the bill of complaint in the patent case you spoke of?

Ans. I do.

Mr. CHOATE. I offer that as an exhibit.

The EXAMINER. "Defendants' Exhibit No. 101", bill of complaint and affidavit attached.

Cross-Int. 1660. I would like to ask you one more question with reference to Goddu machines: Mr. Webster asked you whether any of those machines were manufactured or put out by the United Company, and you made your answer that they were not. If there are any reasons why those machines have not been manufactured or put out, I wish you would state them.

Ans. There was a fundamental weakness in the loose nailer of patent No. 383,044, in that this machine had an edge feed. This rendered the machine entirely impracticable for nailing the heel seats of Goodyear shoes, which is the principal use to which a loose nailing machine is put. At the time the heel seat of a welt shoe is nailed the heel end of the blocked sole, which has previ-

ously been sewed around the shank and fore part, is not trimmed and presents corners, as in the sample which I exhibit. The impracticability of using an edge feed machine for this work is obvious upon inspection of this sample. It should further be noted that this machine was not equipped with a jack. The horn shown in Figure 5 of the patent is adapted only for McKay work. The machine would also be unfitted for shank reinforcing work on the welt shoe, because that operation is performed after the edge of the sole has been trimmed, and there would be liability of mutilating the edge of the sole by the edge feed. The slugging machine of patent 583,086 had the same defect as the loose nailer; that is, this machine had an edge feed instead of an awl feed. The impracticability of an edge-feed slugging machine will be obvious on inspection of a sample heel and top-lift, which I exhibit. It will be observed that the edge of the top-lift presents but little surface for engagement by the edge feeding device, and it is practically impossible to secure the proper spacing for the slugs, which are of course very prominent in the finished shoe. This slugging machine was further impracticable for commercial use because it was so constructed that the horn dropped too far to permit the work to be fed satisfactorily. This could not be remedied without infringing the patents of the United Company. The slugging machine also was not equipped with a jack, and accordingly was not adapted for slugging welt shoes. The standard screw machine of the Goddu Sons Metal Fastenings Company, patent No. 583,045, used a single threaded wire like the old standard screw machine. The speed of the machine was consequently limited to 125 to 140 nails a minute, while the rapid standard screw machine of the United Company, using a double-threaded wire, ran at a speed of from 225 to 240 nails a minute.

The EXAMINER. "Defendants' Exhibit 102" is blocked outsole such as used on welt shoes. "Defendants' Exhibit 103" is a slugged heel.

Cross-Int. 1661. There is a copy of the bill filed in the suit that was brought. I ask you to identify the copy of the bill in the suit

referred to in your redirect examination, and if that is a copy of it, I will put it in evidence.

Ans. This bill of complaint which you have handed to me is a copy of the bill of complaint filed February 2, 1898, in the Circuit Court of the United States, District of Massachusetts, No. 985, James W. Brooks et al. *v.* Goddu Sons Metal Fastenings Company et al.

The EXAMINER. "Defendants' Exhibit 104."

Mr. CHOATE. Nothing else, Mr. Webster.

Direct Examination resumed by Mr. WEBSTER.

Int. 1662. If you now have the data called for and not already put in, will you kindly produce the same?

Ans. You requested me yesterday to give the number, date and title of patents covering modifications adopted in the machine illustrated on page 176 of the United Company's catalogue of 1902, power heel-breasting machine, since 1902. These patents and applications are as follows: reissued patent No. 13,413, April 30, 1912, B. B. Waterman, heel-breasting machine; application of Warren Frazier, 458,603, filed December 7, 1909, renewed as No. 531,798, work support; patent No. 1,023,284, April 16, 1912, F. H. Warren, machines for use in the manufacture of boots and shoes; application serial No. 708,908, filed July 11, 1912, M. F. Brogan. A method of making knives for that machine is covered by application serial No. 712,316, filed July 30, 1912, E. L. Hurd, method of forming knives. You requested me to produce illustrations of the United Company's machines in which features of the machines of Edwin L. Freeman have been incorporated. I now produce an illustration of the United Company's loose nailing machine No. 2.

The EXAMINER. "Plaintiff's Exhibit 201."

[*Ans. continued:*] An illustration of the United Company's Ziz slugger, later named "slugging machine No. 5".

The EXAMINER. "Plaintiff's Exhibit 202."

[*Ans. continued:*] I also produce an illustration of the United Company's rapid standard screw machine. The machine incorpor-

ating the features of Freeman's machine is known as rapid "standard screw machine Model B", but I have not yet been able to procure an illustration of that machine. So far as the parts shown in the photograph are concerned, however, the Model B machine is substantially as shown in this illustration.

The EXAMINER. "Plaintiff's Exhibit 203."

[*Ans. continued:*] You requested me to produce illustrations of the successive models of the Amazeen skiving machine and to state the patents embodied in those models.

Mr. CHOATE. Is that quite the question?

The WITNESS. That is as I recall it. I should have looked that up. I overlooked it.

Mr. CHOATE. He asked you if there was any other machine previously in use known as the Amazeen skiver, and you said "Yes", and he asked how it differed from the Amazeen skiver shown in the catalogue, and that you were to look up.

The WITNESS. I find that Mr. Choate is correct. The machine shown on page 132 of the catalogue of 1902 is the machine then known as "new high speed Amazeen skiving machine". That was preceded by a machine now designated "Model No. 4", but formerly known as "new model" and by "Model No. 3", as it is now designated, formerly known as "old pattern", and illustrated on page 136 of the 1902 catalogue. There were also earlier models, No. 1 and No. 2, of which I do not have illustrations. I now produce illustrations of Model No. 4 and Model No. 3.

The EXAMINER. "Plaintiff's Exhibit 204" is an illustration of Model No. 4. "Plaintiff's Exhibit 205" is an illustration of Model No. 3.

[*Ans. continued:*] If you desire, I can, as previously requested by you, point out how the earlier models differed from that shown on page 132 of the 1902 catalogue, but this explanation would necessarily be somewhat detailed.

Int. 1663. I will not call for it at the present time.

Ans. The data which you requested me to produce this morning as to the suit against the Goddu Sons Metal Fastenings Company I have already furnished in introducing the exhibit bill of com-

plaint. That is all the information which I have ready at this time.

Int. 1664. I observe in bill of complaint, Defendants' Exhibit 101, James W. Brooks and others against Albert Van Wagenen and others, it is alleged that the respondents infringed patents Nos. 383,445, 385,802, 289,103 and 356,107 in the manufacture of a loose nailing machine. Kindly advise whether the United Company, to your knowledge, ever made a loose nailing machine constructed as set forth in the patents above referred to.

Ans. The United Company, or its predecessors in business, built and put out machines embodying the inventions of all these patents. I believe that inventions of all of these patents have been embodied in machines put out by the United Company.

Int. 1665. Kindly state, if you can, whether the loose nailing machines manufactured by the United Company immediately after its organization were constructed like the machines previously put out by the McKay Metallic Fastening Association.

Ans. Immediately after the organization of the United Company it continued to put out the same loose nailing machine which had been put out immediately before the organization of the United Company by the McKay Shoe Machinery Company, which had succeeded the McKay Metallic Fastening Association.

Mr. WEBSTER. Mr. Choate, are you willing to furnish the Government with a list of patents owned by the United Company or any of its associated companies, which patents expired prior to the filing of the petition in this case, and which patents relate to machines for cutting soles from sole leather, machines for lasting shoes, machines for attaching welts to uppers, machines for attaching welts to the outsoles, machines for leveling and laying soles and machines for rough rounding and channeling, thus saving the loss of time and, as it seems to us, unnecessary expense and annoyance involved in procuring this information in some other way?

Mr. CHOATE. It seems to us that it must be presumed that the United States has information to support the allegations made in its bill, and that that information should be supplied by the United States in the ordinary way.

Mr. WEBSTER. Then, as I understand, you decline to furnish the information called for?

Mr. CHOATE. I think I must decline to prepare and furnish the case for the United States.

Mr. WEBSTER. If any expense is involved in preparing the data called for, the Government would cheerfully pay the same. With that in view, have you any objection to furnishing the information?

Mr. CHOATE. That does not aid me, because to prepare its case for the United States would involve the labor of a good many of our men who have other important work to attend to. Now, have you finished with Mr. Howard on redirect?

Mr. WEBSTER. I want to see the record. My suggestion would be that we suspend until next Tuesday, and then I suppose in fifteen minutes we can finish with Mr. Howard on this matter and take up the other.

Mr. CHOATE. Well, what remains upon redirect?

Mr. WEBSTER. I took no memorandum as you were examining the witness. I supposed you would not finish your recross-examination for two days, and I, of course, relied upon the typewritten record. You finished it so quickly that I have no memorandum.

Mr. CHOATE. Well, that is all right.

The EXAMINER. Tuesday at 10 o'clock?

Mr. CHOATE. On Tuesday you will finish his redirect. Do you then want him on direct again at that time?

Mr. WEBSTER. I shall endeavor at that time to get him to tell us about some patents.

Mr. CHOATE. Can't you give him notice about the things you will want, so that he can prepare himself in advance?

Mr. WEBSTER. I will say this: I would like to show by Mr. Howard, unless we can agree upon it, what patents were owned by the United Company and its associate companies, which patents expired prior to the filing of the petition in this case, and which patents relate to machines for cutting soles from sole leather, to machines for lasting shoes, to machines for attaching welts to uppers of shoes, to machines for attaching outsoles to welts of shoes, to

sole-leveling machines, sole-laying machines, and rough-rounding and channeling machines, loose nailers and heelers.

Mr. CHOATE. And that will cover everything you want in the whole inquiry?

Mr. WEBSTER. I do not care at this time to go into any branch of the art other than those named.

Mr. CHOATE. Now, you will notice the allegation under which this evidence is being taken is that many of the patents on the principal machines owned or controlled by them were about to expire as of early in 1899. You do not want him to be prepared on the expiration of patents clear up to the filing of the bill, do you?

Mr. WEBSTER. I would like to run to approximately the time of the filing of the bill. It is a question as to what the term "were about to expire in the near future" means.

Mr. CHOATE [*to the witness*]. Can you be prepared on those points by next Tuesday?

The WITNESS. I would like to have the whole statement by Mr. Webster read to me before I answer that question.

[*Statement of Mr. Webster read by the stenographer as follows:*]

"I would like to show by Mr. Howard, unless we can agree upon it, what patents were owned by the United Company and its associate companies, which patents expired prior to the filing of the petition in this case, and which patents relate to machines for cutting soles from sole leather, to machines for lasting shoes, to machines for attaching welts to uppers of shoes, to machines for attaching outsoles to welts of shoes, to sole-leveling machines, sole-laying machines, and rough-rounding and channeling machines, loose nailers and heelers."

The WITNESS. Could you not narrow that a little? Because when you say "machines for attaching soles to welts" it is not clear whether you intend to include the auxiliary machines.

Mr. WEBSTER. I do not intend to include the auxiliary machines.

Mr. CHOATE. Then you want that information with reference to the welt-sewing machine and the sole-stitching machine, and you want it with reference to what lasting machine?

Mr. WEBSTER. As at present advised, I am more familiar with

the Chase lasting than any other. But I would like a memorandum with reference to other lasting machines if they have gone into use commercially.

Mr. CHOATE. The others which have been mentioned are the Consolidated hand method, — do you want that?

Mr. WEBSTER. As at present advised, I would like it, and I offer that suggestion because I am absolutely unfamiliar with it and do not know what the commercial term means.

Mr. CHOATE. McKay & Copeland, — do you want that?

Mr. WEBSTER. If it is convenient.

Mr. CHOATE. And the Ideal?

Mr. WEBSTER. Yes; but I have to say that after examining these patents I probably will not go into any detail with reference to more than one or two machines of any class. That is, taking lasters, I do not think we will submit evidence later with reference to more than one lasting machine, or one type of lasting machine.

Mr. CHOATE. Which loose nailer do you want him to be prepared on?

Mr. WEBSTER. Any loose nailer that has gone into use.

Mr. CHOATE. The one that came from the McKay Company?

Mr. WEBSTER. I am content.

Mr. CHOATE. And that is now loose nailer No. 2; is that right?

The WITNESS. It was then called "the new loose nailer", but we now speak of it colloquially as the "old loose nailer".

Mr. CHOATE. What heeling machine? The McKay automatic?

Mr. WEBSTER. I am not sufficiently familiar, at the present time, with the machines to be able to identify them from their commercial names.

Mr. CHOATE. Well, now, can't you, Mr. Webster, make yourself familiar with those so that you won't have to cover a great field that you don't care anything about?

Mr. WEBSTER. I will try to.

Mr. CHOATE. Now, I am going to ask to have that list of machines read again.

[*Stenographer reads from statement by Mr. Webster as follows:*]

"I would like to show by Mr. Howard unless we can agree upon it

what patents were owned by the United Company and its associate companies, which patents expired prior to the filing of the petition in this case, and which patents relate to machines for cutting soles from sole leather — "

Mr. CHOATE. You will note that that is not included in the bill at all.

Mr. WEBSTER. I had an impression that it was.

Mr. CHOATE. Do you mean a clicking machine?

Mr. WEBSTER. No; I don't care anything about the clicking machine; I understand the clicking machine is a special machine for cutting uppers.

The WITNESS. Then that would be a dinker.

[*Stenographer continues reading the statement of Mr. Webster:*]

"— to machines for lasting shoes, to machines for attaching welts to uppers of shoes, to machines for attaching outsoles to welts of shoes, to sole-leveling machines, —"

Mr. CHOATE. Now, let us stop there. Now, we have had the Star, the Acme, the Goodyear automatic, and the Atlas. Which one of those do you prefer?

Mr. WEBSTER. I would like all of them, if he has them classified in such a way as to produce the information readily.

Mr. CHOATE. All right.

[*Stenographer continues reading the statement of Mr. Webster:*]

"— sole-laying machines, —"

Mr. CHOATE. That is the Goodyear improved sole layer.

[*Stenographer continues reading the statement of Mr. Webster:*]

" — rough rounding and channeling machines, —"

Mr. CHOATE. There is only one of those.

[*Stenographer continues reading the statement of Mr. Webster:*]

" — loose nailers and heelers."

Mr. CHOATE. Mr. Howard will try to be prepared on those, but without waiving our rights to object to the introduction of any of the evidence which may seem to us inadmissible. Now, Mr. Webster, you asked for patents reading on those machines which expired between 1899 and the date of the filing of the bill?

Mr. WEBSTER. I do not care if they expired before.

Mr. CHOATE. Do you mean before 1899? That is before we came into existence.

Mr. WEBSTER. You would not have that unless it was in the hands of your predecessors, — so, the patents expiring after the United Company came into existence.

Mr. CHOATE. And up to the filing of the bill?

Mr. WEBSTER. Patents relating to those machines, the class of machines noted.

Mr. CHOATE. That is, both in existence and expired?

Mr. WEBSTER. I don't just get what you mean.

Mr. CHOATE. Do you want both the patents that are existing now and those which have expired?

Mr. WEBSTER. I simply care for those which have expired. I don't care for those which were alive at the time of the filing of the bill.

The WITNESS. Now, just what do you mean by the expression "relating to", Mr. Webster?

Mr. WEBSTER. Well, I don't wish to limit the inquiry to patents relating only to machines which the United Company have recently put out, but if the United Company were putting out a machine in 1899, 1900, 1901, 1902, 1903, 1904, 1905 or 1906, upon which any of these patents read, then I desire to know what patents read on such machines.

The WITNESS. My difficulty was the vagueness that I thought I saw in the expression "relating to". I understand that your inquiry is limited to patents the inventions of which were at some time embodied in the commercial machine?

Mr. WEBSTER. Yes.

Mr. CHOATE. Do you want the patents themselves?

Mr. WEBSTER. I would not go so far as to ask for the producing of the patents. I ought to furnish those myself. I shall have to hunt them up. Of course it would be very nice to have them at the time of the inquiry, but there has recently been sent to me about half a ton of patents from the department which are now in

Springfield being classified, and I hope to find among them the patents which I need.

The EXAMINER. We will adjourn to Tuesday morning next, at 11 o'clock.

[*Hearing adjourned to Tuesday, July 22, 1913, at 11 o'clock* A. M.]

BOSTON, MASS., July 22, 1913.

Mr. CHOATE. Mr. Howard desires to correct one statement in his testimony.

Mr. WEBSTER. Very well.

The WITNESS. I desire to correct my answer to a question on page 1969 of the typewritten record [printed page 2049]. The question was: "Did the United Company put out any machines, after its purchase from the American Sole Laying Company, constructed like the machines which had previously been put out by the American Sole Laying Company?" I have learned since that session that the United Company put out fifty sole-laying machines substantially the same as the machines which had been put out by the American Sole Laying Machine Company prior to its acquisition by the United Company. The United Company continued putting out these machines so long as there was any demand for them from shoe manufacturers.

In response to a request from Mr. Webster that I produce drawings or cuts of machines in which features of the Freeman machine had been incorporated, I produced a photograph of the rapid standard screw machine, explaining that the Freeman features had been embodied in the rapid standard screw machine Model B, but that I did not at the time have a cut of that machine. I now have and produce a photograph of the Model B rapid standard screw machine in which the features of the Freeman machine to which I refer have been incorporated.

[*Print of Model B rapid standard screw machine introduced in evidence and marked "Plaintiff's Exhibit 206".*]

Mr. CHOATE. I would like to ask one further question, to explain one of his answers.

Cross Examination resumed by Mr. CHOATE.

Cross-Int. 1666. In your answer as to the Goddu loose nailing machine and the Goddu slugging machine, you used the terms "edge feed" and "awl feed". Please describe what you mean by those terms and describe the difference between the two kinds of feeds.

Ans. In the loose nailer or slugging machine having an edge feed, there is a device which engages the edge of the sole and which is given a motion in the direction in which it is desired that the work be fed to move the work along into position for the insertion of the next fastening. This mechanism comprises a tool having a serrated or roughened edge for engaging the stock. In an awl feed loose nailing or slugging machine, the machine is so organized that, after the awl has entered the stock to make the hole for the reception of the next fastening, the awl is moved toward and under the driver to bring the hole made by it into exact alignment with the driver, after which the awl is removed from the stock and the driver operates to insert the fastening.

Cross-Int. 1667. Was it a simple matter to substitute one of those feeds for the other?

Ans. It would not be a simple matter in any machine, and in the two Goddu machines in question, that is, the loose nailer and the slugger, such substitution would have involved entire reconstruction of the machines, and the machines so reconstructed would have been entirely different from the machines as actually built by the Goddu Company.

Mr. CHOATE. That is all, Mr. Webster.

Direct Examination resumed by Mr. WEBSTER.

Int. 1668. Referring to the Breach machine, I understand you to say, in response to questions by Mr. Choate, that a large amount of money was spent in the endeavor to make the idea embodied in Breach's alleged invention commercial. Kindly state if you have any personal knowledge as to the amount of money spent as stated by you.

Ans. I was in touch with the work as it was going on, and I think I may properly say that I have personal knowledge that the United Company expended approximately $30,000 in this connection.

Int. 1669. Have you examined any data to enable you to testify as to the expenditure in question?

Ans. As to the amount which I have stated, I am relying upon information furnished by those who have access to the figures.

Int. 1670. Then, as to these facts you are testifying as to what some one else tells you; is that correct?

Ans. My testimony is based on my personal knowledge, as explained above, and upon information substantiating my personal knowledge, which I have received from others who have occasion to know the facts.

Int. 1671. In connection with the same matter, I understand you to say that shoe manufacturers could not be interested in the Breach sole-cutting machine. Kindly state just what you mean by that reply and your source of information.

Ans. I have personal knowledge that the machine was tried out in shoe factories. I was not directly informed by any shoe manufacturer that he did not wish to have the machine in his factory, but I was so advised by others who have direct dealings with shoe manufacturers.

Int. 1672. You refer in your recross-examination to the Bay State Company stitcher and welter, and I understand you to say that the Bay State Company did not have patents in the United States. Will you kindly state whether the stitchers and welters of the Bay State Company went into use abroad, if you know?

Ans. About ten sets of these machines were put out in England. By "set" I mean the combination of the two machines; that is, ten welters and ten stitchers.

Int. 1673. But whether any were put out in Canada you have no knowledge?

Ans. I have not at this time.

Int. 1674. In your recross-examination you refer to the Seaver lasting machine, and you said that there was no demand for that

machine after the purchase of the Seaver patents. Kindly state, if you know, whether the Seaver lasting machine was put out by the Seaver Company prior to the acquisition of the assets of the Seaver Company by the United Company.

Ans. Yes, sir; it was.

Int. 1675. Kindly say, if you know, for about how long a period the Seaver lasting machine was in use prior to the acquisition of the assets of that company by the United Company.

Ans. I cannot state from memory.

Int. 1676. State approximately if you can do so.

Ans. I could not state, without looking it up, that the machines were in use for as long a period as one year.

Int. 1677. You mean prior to the purchase?

Ans. Prior to the acquisition of the Seaver patents by the United Company.

Mr. WEBSTER. I do not think of anything further at the present time. Shall I go on with Mr. Howard?

Mr. CHOATE. Now, I understand you call him to examine him on direct on some other subject.

Mr. WEBSTER. Simply calling upon him for the list of patents as noted in the last hearing.

[*Signature waived.*]

Attest: CHARLES K. DARLING, *Special Examiner.*

SECOND DEPOSITION OF NELSON W. HOWARD.

Direct Examination by ALLEN WEBSTER, Esq., *of Counsel for Complainant.*

Int. 1. Will you now produce the list of patents belonging to the United Shoe Machinery Company and its affiliated companies, which patents expired prior to the filing of the petition in this case, and which patents relate to machines for cutting soles from sole leather, machines for lasting shoes, machines for attaching welts to uppers, machines for attaching welts to outsoles, machines for leveling and laying soles, machines for rough rounding and

channeling soles, and metallic fastening machines and heeling machines?

Ans. As to the next to the last machine mentioned by you, your request was for patents on loose nailers, and I have here lists of patents on loose nailing machines, as well as lists of patents on the other machines mentioned by you.

Int. 2. Kindly produce the lists of such expired patents relating to machines for cutting soles from sole leather.

Ans. The United Shoe Machinery Company did not acquire from any of the companies which went into the United Company in February, 1899, any machines for cutting soles or any patents on such machines, and the United Company did not manufacture and put out any sole-cutting machines for several years after February, 1899.

Int. 3. Will you kindly produce the list of expired patents called for relating to machines for lasting shoes?

Ans. I now produce a list of patents on "lasting machine, Chase". A list of patents on lasting machine —

Mr. CHOATE. Let us have that marked as an exhibit.

Int. 4. Kindly read to the magistrate the number, title, date and name of inventor of each patent on the Chase lasting machine, which patents expired prior to the filing of the petition in this case.

Mr. CHOATE. I shall have to object to that question, Mr. Webster, as not within the scope of this order. I am perfectly willing you should use those lists which will serve a useful purpose to get this thing in a condensed form quickly. But your order does not entitle you to make any such inquiry. It is limited to proof of Letters Patent under which the defendants were manufacturing their machines in 1899, and proof that many of those patents were about to expire. Now, we shall be glad to convenience you if the United States will occasionally convenience us.

Mr. WEBSTER. At the last session, counsel for the United States inquired of counsel for the defendants whether Mr. Howard would produce a list of patents of the United Company and its associated companies relating to the various machines referred to, which patents had expired prior to the filing of the bill. It was the

understanding of counsel for the United States that counsel for the defendants agreed that Mr. Howard would produce such list. This, as it seems to us, is one step going to the support of the allegation referred to by learned counsel for the defendants.

Mr. CHOATE. Well, it seems to us that it is a great deal broader than the allegations of the bill. The bill suggests a certain situation: that in 1899 the patents which had existed were about to expire, and that that was the occasion for doing something, which something was a conspiracy and combination which the bill charges. It does not seem to us that that opens to you the opportunity for an inquiry as to what patents expired all the way from 1899 up to 1911.

Mr. WEBSTER. Are we to understand that counsel for the defendants instructs the witness not to answer the question?

Mr. CHOATE. I think I shall have to, Mr. Webster.

Mr. WEBSTER. And does the witness, acting under instruction, decline to answer?

The WITNESS. I do.

Mr. WEBSTER. In view of the attitude of counsel for the defendants and the witness, I desire to confer with my superior, and suggest a recess to enable me so to do, and desire to know of counsel for the defendants whether he will permit me to submit the lists in question to my superior to ascertain his views with reference to acceding to request of counsel for defendants, or as to what method counsel for the Government will pursue.

Mr. CHOATE. Counsel for the defendants has not made any request. I shall have to correct your statement in that respect. You may do anything which you would like to do. You may take one of these lists showing in substance what each of them show, for the purpose of confering with your associates.

Mr. WEBSTER. It was the understanding of counsel for the United States that counsel for the defendants requested that if the lists went in, the lists should comprise not only the patents which had expired but also patents now alive. Hence the remark as to "acceding to request of counsel for defendants".

Mr. CHOATE. I don't think any such request was stated. I sug-

gested that it would be convenient if a list of patents on machines of any type was to be put in the record. It would be more intelligible if the complete list was put in, and put in in one place so that the court would not be required to search through various parts of the record to ascertain the patent protection of any particular machine; and to accomplish that desirable result I did not object to your going beyond the scope of the court's order. But I did suggest that if you went beyond the scope of the court's order that that would be a desirable result, and that if you did not think at the moment that you could confine yourself to that, it seemed to me that we better follow the court's order.

Mr. WEBSTER. The request was specific and related only to patents which expired prior to the filing of the petition. As at present advised, counsel for the United States does not care to introduce and does not call for a list of any patents other than those specifically referred to, to wit, those which had expired prior to the filing of the petition. And in view of the attitude of counsel for the defendants, counsel for the Government suggests that recess be had until counsel may have an opportunity to confer with his superior.

Mr. WEBSTER. I learn that Mr. Gregg is not in the city: that he cannot get here until Wednesday morning. I have telegraphed to Mr. Gregg and expect he will reach Boston early Wednesday. I therefore suggest a further postponement or recess until Wednesday at 10 o'clock in the forenoon.

[*Adjourned to 10* A. M., *Wednesday, July 23, 1913.*]

BOSTON, MASS., July 23, 1913.

[*By direction of the Examiner and agreement of counsel the hearing was further suspended until 2 o'clock* P.M.]

Int. 5. Will you now read into the record a list of the number, date, title and name of applicant of patents called for in previous interrogatories, to wit, those which had expired prior to December 12, 1911, and after February 7, 1899.

Ans. Lasting machine, Chase: No. 329,366, October 27, 1885, Crisp, tacking machine: No. 337,925, March 16, 1886, Chase,

lasting machine for boots or shoes; No. 340,860, April 27, 1886, Chase, lasting machine; No. 364,088, May 31, 1887, Chase, machine for lasting boots or shoes; No. 376,368, January 10, 1888, Chase, lasting machine; No. 483,375, September 27, 1892, Chase, tack-driving mechanism.

Lasting machine, Consolidated hand method: No. 274,207, March 20, 1883, Matzeliger, lasting machine; No. 281,306, July 17, 1883, Scott, lasting machine for boots and shoes; No. 284,906, September 11, 1883, Scott, machine for lasting boots and shoes; No. 292,575, January 29, 1884, Pearson, lasting machine; No. 415,726, November 26, 1889, Matzeliger, mechanism for distributing tacks, nails, etc.; No. 421,954, February 25, 1890, Matzeliger, nailing machine; No. 423,920, March 25, 1890, Gooding and Ladd, nail and tack driving machine; No. 423,921, March 25, 1890, Gooding and Ladd, pegging machine; No. 423,922, March 25, 1890, Gooding and Ladd, lasting machine; No. 423,937, March 25, 1890, Matzeliger, tack separating and distributing mechanism; No. 441,482, November 25, 1890, Gooding and Ladd, nail-driving machine; No. 459,899, September 22, 1891, Matzeliger, lasting machine; No. 500,141, June 27, 1893, Ladd, lasting machine; No. 510,972, December 19, 1893, Ladd, starting and stopping mechanism for lasting machines; No. 510,973, December 19, 1893, Ladd, lasting machine; No. 510,975, December 19, 1893, Ladd, lasting machine; No. 510,976, December 19, 1893, Ladd, tacking machine; No. 510,977, December 19, 1893, Ladd, lasting machine; No. 510,978, December 19, 1893, Ladd, tack separating and feeding mechanism; No. 523,939, July 31, 1894, Ladd, lasting machine.

Lasting machine, Ideal: No. 329,282, October 27, 1885, Copeland et al., lasting machine; No. 365,505, June 28, 1887, Copeland et al., lasting machine for boots or shoes; No. 422,734, March 4, 1890, Copeland et al., lasting machine; No. 446,631, February 17, 1891, Crisp et al., tack-driving machine; No. 455,174, June 30, 1891, Crisp et al., tack-driving machine; No. 465,073, December 15, 1891, Copeland et al., lasting machine; No. 500,225, June 27, 1893, Crisp et al., tack-driving machine; No. 500,319, June 27, 1893,

2105

Crisp, tack-driving machine: No. 521,954, June 26, 1894, Grandy, lasting machine.

Lasting machine, McKay and Copeland: No. 286,893, October 16, 1883, Brock, lasting machine; No. 288,689, November 20, 1883, Brock, lasting machine; No. 302,885, August 5, 1884, Brock, lasting machine; No. 306,671, October 14, 1884, Brock, tack-driving implement; No. 371,816, October 18, 1887, Brock, lasting machine.

Lasting Machine No. 5, U. S. M. C.; none of the patents covering inventions embodied in this machine expired prior to December 12, 1911.

Shoe machine, Goodyear welt and turn: No. 317,759, May 12, 1885, French, sole-sewing machine; No. 412,704, October 8, 1889, French and Meyer, shoe-sewing machine; No. 461,793, October 20, 1891, Briggs, method of forming chain stitches; No. 488,505, December 20, 1892, LaChapelle, tension device for sewing machines; No. 495,452, April 11, 1893, Cole, sewing machine; No. 507,873, October 31, 1893, Arnold and Arnold, shoe-sewing machine; No. 518,911, April 24, 1894, Briggs, take-up for shoe-sewing machines.

Sewing machine, Goodyear Universal inseam: No. 366,935, July 19, 1887, Dancel, sole-sewing machine; No. 412,703, October 8, 1889, French and Meyer, sewing machine; No. 488,505, December 20, 1892, LaChapelle, tension device for sewing machines; No. 495,452, April 11, 1893, Cole, sewing machine.

Lockstitch machine, Goodyear outsole rapid: No. 366,935, July 19, 1887, Dancel, sole-sewing machine; No. 412,703, October 8, 1889, French and Meyer, sewing machine; No. 424,966, April 8, 1890, French and Meyer, shuttle for sewing machines; No. 473,870, April 26, 1892, French and Meyer, sole-sewing machine; No. 474,774, May 10, 1892, French and Meyer, sole-sewing machine.

Leveling Machine, Atlas: none of the patents covering inventions embodied in this machine expired prior to December 12, 1911.

Leveling Machine, Goodyear Automatic Sole: none of the patents covering inventions embodied in this machine expired prior to December 12, 1911.

Leveling Machine, Goodyear Welt and Turn (Turn Work): none of the patents covering inventions embodied in this machine expired prior to December 12, 1911.

Leveling Machine, Goodyear Welt and Turn (Welt Work): none of the patents covering inventions embodied in this machine expired prior to December 12, 1911.

Leveling Machine, Hercules: none of the patents covering inventions embodied in this machine expired prior to December 12, 1911.

Laying machine, Goodyear improved sole: No. 304,416, September 2, 1884, Eppler, sole-laying machine; No. 315,923, April 14, 1885, Eppler, sole-laying Machine; No. 335,016, January 26, 1886, Coupal and Wood, sole-laying machine; No. 353,251, November 23, 1886, Coupal, sole-laying machine; No. 362,447, May 3, 1887, Holland, sole-laying machine; No. 375,549, December 27, 1887, Hamm, sole-laying machine; No. 376,406, January 10, 1888, Coy, sole-laying machine.

Laying Machine, Goodyear Rotary Sole: none of the patents covering inventions embodied in this machine expired prior to December 12, 1911.

Rounding machine, Briggs, rough; rounding and channeling machine, Goodyear Universal: No. 463,967, November 24, 1891, Briggs, rough rounding and channeling machine; No. 463,982, November 24, 1891, Briggs, rough rounding and channeling machine; No. 511,263, December 19, 1893, Briggs and Dancel, rough rounding and channeling machine; No. 529,900, November 27, 1894, French and Meyer, channeling machine.

Nailing machine, Hungarian; nailing machine, loose: No. 265,227, September 26, 1882, Goddu, machine for driving sole fastenings; No. 356,107, January 16, 1887, Dunham, boot or shoe nailing machine; No. 383,455, May 29, 1888, Goddu, nailing machine; No. 490,624, January 24, 1893, Goddu, machine for uniting soles to uppers.

Loading and attaching machine, McKay automatic heel: No. 310,488, January 6, 1885, Allen, heel-nailing machine for boots or shoes; No. 317,851, May 12, 1885, Raymond, heel-nailing machine; No. 346,137, July 27, 1886, Towns et al., nail making

and distributing machine; No. 413,554, October 22, 1889, Raymond, nail machine; No. 446,383, February 10, 1891, Glidden et al., heeling machine; No. 502,667, August 1, 1893, Glidden, heel-compressing and loading machine.

Nailing Machine, Alpha Wood Heel: none of the patents covering inventions embodied in this machine expired prior to December 12, 1911.

Nailing machine, American lightning: No. 305,723, September 23, 1884, Tyler, heel-nailing machine; No. 321,401, June 30, 1885, Tyler and Merritt, heeling machine; No. 321,530, July 7, 1885, Raymond, heel-nailing machine; No. 343,703, June 15, 1886, Demary, heel-nailing machine; No. 446,885, February 24, 1891, Pope, heel-nailing machine.

Nailing machine, McKay rapid: No. 310,488, January 6, 1885, Allen, heel-nailing machine for boots or shoes; No. 446,383, February 10, 1891, Glidden and Elliott, heeling machine; No. 477,098, June 14, 1892, Brown and McCoy, heel-nailing machine.

That is all, Mr. Webster.

Int. 6. Does the list of expired patents which you have read into the record include patents under which the Goodyear Shoe Machinery Company, the International Goodyear Shoe Machinery Company, Goodyear Shoe Machinery Company of Canada, Consolidated & McKay Lasting Machine Company, McKay Shoe Machinery Company, Eppler Welt Machine Company, International Eppler Welt Machine Company and Davey Pegging Machine Company operated under or owned at the time these companies were taken over by the United Shoe Machinery Company?

Ans. The patents which I have named are those which expired prior to December 12, 1911, and the inventions of which were embodied in the machines named, which machines are those mentioned in the request for this information in response to which the lists are produced. The machines which I have named were being put out in February, 1899, by the Consolidated & McKay Lasting Machine Company, the Goodyear Shoe Machinery Company and the McKay Shoe Machinery Company, respectively, excepting lasting machine No. 5 U. S. M. C., leveling machine Atlas, leveling machine Good-

year welt and turn (turn work), leveling machine Goodyear welt and turn (welt work), leveling machine Hercules, laying machine Goodyear improved sole, nailing machine Hungarian and nailing machine Alpha wood heel, each of which machines were first put out by the United Shoe Machinery Company subsequently to February 7, 1899.

Direct Examination by WILLIAM S. GREGG, Esq., *of Counsel for Complainant.*

Int. 7. Does that list include all the patents owned or controlled by the Goodyear Shoe Machinery Company, for example, on welting machines that expired prior to December 12, 1911, that were taken over by the United Shoe Machinery Company from the Goodyear Company at or about the time the United was formed?

Ans. The lists which I have read into the record comprise all patents covering inventions embodied in the machines of the Goodyear Shoe Machinery Company named by me and as to which information was specifically requested by Mr. Webster, in February, 1899, which expired prior to December 12, 1911.

Int. 8. What I intended to ask you there was, regardless of any request Mr. Webster made: Whether or not that list included all the patents, or whether that list is only in response to what he specifically requested?

Ans. The lists which I have read into the record do not include all patents owned by the Goodyear Shoe Machinery Company relating to machines of the types named. The lists are limited to patents the inventions on which were used in the machines named.

Int. 9. What do you mean by "machines named"? I merely took the words "sewing machine" as an example. Does the list include all the patents on the welt-sewing machine — just take that one machine that the Goodyear Company owned or controlled at the time it went into the United Company, and that expired prior to December 12, 1911?

Ans. The list of patents on the welt-sewing machine includes all the patents covering inventions used in the welt-sewing machine of

the Goodyear Shoe Machinery Company in February, 1899, which expired prior to December 12, 1911.

Int. 10. Then the list of expired patents, for example, on welt-sewing machine, which you have read into the record and which were acquired by the United Company of the Goodyear Shoe Machinery Company, includes all patents which expired prior to December 12, 1911, regardless of the date of assignment by the Goodyear Company to the United Company?

Ans. Yes, sir. I did not pay the slightest attention to the date of the assignment, because that was done at the convenience of counsel. I assumed, in preparing that list, that all the patents that read on those machines were under the control of the United Company from that date.

Int. 11. While I mentioned there the welt-sewing machine specifically, your answer would also apply to outsole stitching machines or any other machines acquired from the companies mentioned in the petition that became a part of the United Company?

Ans. Yes. My answer would apply likewise to all of the machines named by me.

Direct Examination by ALLEN WEBSTER, Esq., *of Counsel for Complainant.*

Int. 12 (*by* Mr. WEBSTER). The lists you have read into the record, as I understand your statement, are lists of patents expiring on or before December 12, 1911, covering inventions embodied in machines manufactured by the several companies which together went to make up the United Shoe Machinery Company. Am I correct in that understanding?

Ans. Yes; inventions embodied in the machines named.

Int. 13. Now, have you a list of patents owned or controlled by said several companies, which patents the inventions of which were not embodied in machines of said companies and which patents expired on or before December 12, 1911?

Ans. No, sir; I have not.

Int. 14. Could you procure such lists without serious inconvenience?

Mr. CHOATE. I do not see how that is included in this issue submitted to the Examiner.

Mr. WEBSTER. Let him say whether he could or not.

Mr. CHOATE. Well, I suppose it is possible, if men enough and time enough are taken, to procure any of those lists, but I do not see why he should be asked to do it.

Mr. WEBSTER. Do you instruct him not to answer?

Mr. CHOATE. No. I object to the question.

Mr. WEBSTER. The witness should say something.

The WITNESS. Am I instructed —

Mr. CHOATE. It seems to me that the question is outside the scope of the issue submitted to this Examiner. You can state how long it might take you to compile such list, how many men you would have to put on.

The WITNESS. If I were to present this list tomorrow, probably the preparation and verifying of the list would require that the entire force of the patent department work most of the night.

Mr. CHOATE. I think I really ought to insist upon the ordinary rule that the examination be by one counsel. I have not been very strict about that.

The EXAMINER. Do you apprehend that the Examiner has any control over that other than note your objection on the record?

Mr. CHOATE. Perhaps this will be sufficient.

Mr. GREGG. I have no objection to putting the questions through Mr. Webster.

Int. 15. Kindly state whether the inventions of any of the patents you have not specified and which expired prior to December 12, 1911, which patents were owned or controlled by the several companies going to make up the United Company, were incorporated in any machines afterwards manufactured by the United Company. This relates, of course, to the types of machines which I will enumerate: welt turn machines, welt sewing machines, outsole stitchers, lasters, sole layers, sole levelers, rough rounders, loose nailers and heelers.

Ans. It is quite possible that inventions of patents not embodied in commercial machines just prior to February, 1899, were subse-

quent to that date embodied by the United Shoe Machinery Company in different models or types of machines. I could not answer more definitely without an extended investigation. I now, of course, have reference to patents relating to machines of the types named in the lists which expired prior to December 12, 1911.

Mr. CHOATE. Have you completed your examination of Mr. Howard?

Mr. WEBSTER. The present examination.

Cross Examination by CHARLES F. CHOATE, Jr., Esq., *of Counsel for Defendants.*

Cross-Int. 16. In answer to questions of counsel for the United States, you read from lists which you had prepared, which lists show the patent protection upon the various machines which you have named between February, 1899, and the present date?

Ans. Yes, sir.

Cross-Int. 17. And have you those lists there before you?

Ans. Yes, sir.

Cross-Int. 18. In some instances were inventions embodied in machines prior to December 12, 1911, upon which patents have since been granted?

Ans. Yes, sir.

Mr. CHOATE. I offer these lists and ask to have them put into the record in full as to what Mr. Howard would have testified constituted the patent protection on the machines inquired of by the counsel for the United States during the period between February, 1899, and the present time.

Mr. WEBSTER. That is put in as defendants' exhibit?

Mr. CHOATE. Yes; for convenience, I would like to have them go into the record at this point. It will all go in as one exhibit.

[*List of patents on inventions embodied in machines inquired about by counsel for the United States between February, 1899, and the present time offered in evidence, and marked "Defendants' Exhibit 105", appended hereto, as follows:*]

DEFENDANTS' EXHIBIT 105.

[Put in Evidence, page 2112.]

Cross-Int. 19. Calling your attention for the moment to these lists, where it appears that the date of the patent is subsequent to February, 1899, my understanding is that such patents as are named subsequent to that date cover inventions which were embodied in the machines under which they are listed?

Ans. Yes, sir; that is correct.

Cross-Int. 20. Will you look at your list, please, patents on shoe machines Goodyear welt and turn? Among the names of persons to whom the patents were issued appears the name "Eppler". Do you know whether that was Andrew J. Eppler?

Ans. That was Andrew Eppler, formerly Andrew Eppler, Jr.

Cross-Int. 21. And is it the same Eppler whose name appears in the list of patents under the heading "Lockstitch Machine, Goodyear Outsole Rapid"?

Ans. Yes, sir.

Cross-Int. 22. Your lists as given to counsel for the United States refer to a leveling machine, Goodyear welt and turn for turn work, and leveling machine, Goodyear welt and turn for welt work. Do those refer to machines, the one for doing work on turn shoes and the other for doing leveling on welt shoes?

Ans. Yes, sir.

Mr. CHOATE. That is all.

[*Signature waived.*]

Attest: CHARLES K. DARLING, *Special Examiner.*

Adjourned to 11 A. M., Monday, July 28, 1913.

By agreement of counsel the hearing was further suspended until 11 A. M. on July 29, 1913.

BOSTON, MASS., July 29, 1913.

DEPOSITION OF JOHN J. DOIDGE.

Direct Examination by ALLEN WEBSTER, Esq., *of Counsel for Complainant.*

Int. 1. Your name is John J. Doidge and you are the same John J. Doidge who has heretofore testified in this case?

Ans. Yes, sir.

Int. 2. In your former testimony you stated that the company with which you are connected had manufactured stitchers which I understand you testified were of the type known as the out-sole rapid lockstitch machine.

Ans. Yes, sir.

Int. 3. Kindly examine the cut I now hand you, the same being illustration found on page 24 of the United Shoe Machinery Company catalogue of 1902, and state whether the illustration is of a machine such as you understand to be known as an out-sole rapid lockstitch machine [*handing catalogue to witness*].

Ans. Yes, sir.

Mr. WEBSTER. The cut referred to by the witness, together with the printed matter on page 25, offered in evidence and marked "Plaintiff's Exhibit 207".

[*Cut of out-sole rapid lockstitch machine on page 24, and printed matter on page 25, of the catalogue, marked "Plaintiff's Exhibit 207".*]

Int. 4. Please examine the photograph which I now hand you, and state what it is a photograph of, and when, if you know, it was made [*handing photograph to witness*].

Ans. It is a photograph of a rapid out-sole lockstitch machine. The photograph was made yesterday.

Mr. WEBSTER. The photograph identified by the witness is offered in evidence and marked "Plaintiff's Exhibit 208".

[*Photograph of rapid out-sole lockstitch machine marked "Plaintiff's Exhibit 208".*]

Int. 5. Please state whether the machine of which Plaintiff's Exhibit 208 is a photograph is one of the machines referred to by you in your former testimony, as having been manufactured by the company with which you are connected, which were first made in the latter part of 1909.

Ans. [*After examining photograph Exhibit 208.*] Yes.

Int. 6. State whether the rapid out-sole lockstitch machines as shown in the photograph Plaintiff's Exhibit 208 are successfully operating machines.

Mr. CHOATE. Wait. That is not within the scope of the order, and the defendants object to it as not authorized by the order and as incompetent, inadmissible and immaterial.

Mr. WEBSTER. Well, I suppose he can answer the question and take it up later.

Ans. Yes.

Int. 7. State whether, to your knowledge, machines constructed like the machine illustrated in the photograph have been put in operation.

Mr. CHOATE. The same objection.

Ans. They have.

Int. 8. Mr. Howard, in his deposition, read into the record the following noted numbers and dates of patents as among the patents, the inventions of which were incorporated in lockstitch machines and which patents expired between February 7, 1899, and December 12, 1911, namely: —

French and Meyer, sole sewing machine, No. 474,774, dated May 10, 1892, expired May 10, 1909;

French and Meyer, sole sewing machine, No. 473,870, dated April 26, 1892, expired April 26, 1909;

French and Meyer, shuttle for sewing machines, No. 424,966, dated April 8, 1890, expired April 8, 1907.

State whether you have carefully examined the drawings of said patents and the descriptive portion of the specifications and compared such drawings and specifications with the machine illustrated in the photograph Plaintiff's Exhibit 208.

Ans. I would like to see the drawings.

Int. 9. Pardon me. [*Hands copies of patents to witness.*]

Ans. Yes, sir.

Int. 10. State whether the machine illustrated in photograph Plaintiff's Exhibit 208 is constructed and operates as shown in the patents referred to in the last question.

Mr. CHOATE. Please note defendants' objection to the question, as witness is not shown to be qualified to answer the question and as the subject-matter inquired of is not within the scope of the order, is immaterial and inadmissible.

Ans. As shown in Nos. 473,870 and 474,774, with one exception.

Int. 11. To save time, you might state the exception right here.

Ans. In drawing 474,774 it shows a flat spring and we used a U-shaped spring. That is the only difference. Part of 424,966 is used. I refer to the gate shown in Fig. 1, *h'*.

Int. 12. Were you present yesterday when Mr. Charles McC. Chapman, of New York, examined the machine you are testifying about?

Ans. Yes, sir.

Int. 13. State whether a welting machine was examined yesterday by yourself and Mr. Chapman.

Ans. There was.

Int. 14. Was a photograph made yesterday of the welting machine examined by yourself and Mr. Chapman yesterday?

Ans. Yes, sir.

Int. 15. Kindly examine photograph I now hand you and state whether it is a photograph of the machine examined by Mr. Chapman and yourself yesterday.

Ans. Yes, sir.

Mr. WEBSTER. Photograph identified by the witness introduced in evidence and marked "Plaintiff's Exhibit 209".

[*Photograph of welting machine marked "Plaintiff's Exhibit 209".*]

Int. 16. Please state whether the welter illustrated in Plaintiff's Exhibit 209 had any markings on it; and, if so, state what they were.

Ans. [*After examining photograph.*] The head is marked on a plate: "Property of the United Shoe Machinery Company, Lessor, Goodyear Department, Goodyear Welt and Turned Shoe Machine, No. 1941." The base had a plate marked: "423, Welt and Turn Shoe Machine, Patented. The property of the Goodyear Shoe Machinery Company, Lessor, Boston, Mass."

Int. 17. Mr. Howard testified with reference to patents on welters, the inventions of which had been incorporated in welters and which patents had expired between February 7, 1899, and December 12, 1911, among which patents he narrated the following: —

Patent to Z. T. French, sole sewing machine, No. 317,759, patented May 12, 1885; expired May 12, 1902;

Patent to French and Meyer, sole sewing machine, No. 412,704, dated October 8, 1889; expired October 8, 1906;

Patent to LaChapelle, tension device for sewing machines, No. 488,505, dated December 20, 1892; expired December 20, 1909;

Patent to Briggs, take-up for shoe sewing machines, No. 518,911, dated April 24, 1894, and expired April 24, 1911.

Kindly state whether you have examined the drawings and the

descriptive portions of the specifications of these several patents and whether you understand the construction therein illustrated and described [*passing copies of patents to witness*].

Ans. [*After examining patents.*] Yes, sir.

Int. 18. Please state whether the welting machine illustrated in photograph Plaintiff's Exhibit 209 is constructed as set forth in said patents examined by you, excepting, of course, the Briggs method patent.

Mr. CHOATE. Please note the defendants' objection to the question as not within the scope of the order, that the witness is not qualified to answer, and that the question is inadmissible and immaterial.

Mr. WEBSTER. Then you will have two objections, Mr. Choate; first, that it is not within the scope of the order; and, second, that he is not qualified, —

Mr. CHOATE. Yes.

Ans. The machine is built in accordance with No. 412,704 —

Mr. WEBSTER. Do you wish to examine as to his qualifications?

Mr. CHOATE. No.

Mr. WEBSTER. Then I would like to have it noted on the record that Mr. Choate is invited to examine the witness as to his qualifications and declines.

[*Ans. continued:*] — 438,505, 518,911, and has some of the elements shown in 317,759.

Int. 19. I don't know whether you mean that the machine has the elements without the patents.

Ans. Some of the elements shown in 317,759.

Int. 20. But not all of them?

Ans. Not all of them.

Int. 21. Just here, kindly state how much experience you have had in the manufacture of shoe machinery.

Ans. I worked at shoe machinery business since 1888, with the exception of four years between the dates 1902 and 1907.

Int. 22. State whether you have had any experience in building machines such as are illustrated in the photograph of stitcher marked "Plaintiff's Exhibit No. 208".

Ans. Yes.

Int. 23. How many years' experience have you had with reference to building such machines?

Ans. Since 1907.

Int. 24. State whether you have had any experience in building, operating or repairing welting machines such as illustrated in photograph Plaintiff's Exhibit 209.

Ans. I have had experience in making parts for a similar machine. I might correct that and say somewhat similar.

Mr. WEBSTER. You have no objection to his putting in "somewhat" there?

Mr. CHOATE. That is all right.

Int. 25. State, if you know, whether welting machines like that illustrated in photograph Plaintiff's Exhibit 209 have been extensively and successfully operated.

Ans. I believe they have.

Mr. CHOATE. Please note my objection to the answer as not responsive to the question and as not competent or admissible evidence.

Mr. WEBSTER. The United States offers in evidence the patents referred to by the witness. The same are marked as follows:— "French and Meyer Patent [stitcher] No. 474,774, Plaintiff's Exhibit 210"; "French and Meyer Patent [stitcher] No. 424,966, Plaintiff's Exhibit 211"; "French and Meyer Patent [stitcher] No. 473,870, Plaintiff's Exhibit 212"; "French Patent [welter] No. 317,759, Plaintiff's Exhibit 213"; "French and Meyer Patent [welter] No. 412,704, Plaintiff's Exhibit 214"; "LaChapelle Patent [tension device] No. 488,505, Plaintiff's Exhibit 215"; "Briggs Patent [take-up for welters] No. 518,911, Plaintiff's Exhibit 216"; "Briggs Patent [method of operating chain stitches] No. 461,793, Plaintiff's Exhibit 217."

You may inquire, Mr. Choate.

Mr. CHOATE. If it would not inconvenience you, I should like to suspend this cross-examination until 2 o'clock.

Mr. WEBSTER, You may. Shall we take a recess, then?

Mr. CHOATE. No. Haven't you another witness you can put on?

Mr. WEBSTER. I do not care to put him on until you finish with Mr. Doidge.

Cross Examination by CHARLES F. CHOATE, Esq., *of Counsel for Defendants.*

Cross-Int. 26. Where was the photograph Exhibit 208 taken?

Ans. Taken in South Framingham in one of the buildings known as the R. H. Long Machinery Company.

Cross-Int. 27. Was the machine which is the subject of the photograph a machine which had been built under your direction?

Ans. Yes, sir.

Cross-Int. 28. How long ago?

Ans. Some time in August, 1909, we started to build that machine.

Cross-Int. 29. And in what part of the R. H. Long factory was it when photographed?

Ans. It was in the building nearest Winter Street bridge.

Cross-Int. 30. What is the name or designation of that room?

Ans. The particular room? The needle room.

Cross-Int. 31. How long, if at all, has the machine been in operation?

Ans. It has been in operation in the assembling room, stitched on, for an hour or more, some time the last of last month or the beginning of this present month.

Cross-Int. 32. Is that all the operating that was ever done, to your knowledge?

Ans. That is all.

Cross-Int. 33. In was built in 1909 and was not operated at all until about how long ago?

Ans. I understood you to ask me when we started to build the machines. That particular machine was assembled some time last month. We started to build the machines some time in 1909.

Cross-Int. 34. I asked you when this machine was built.

Ans. I don't think I could give you any better answer than that. Possibly some of the parts were manufactured during 1909, and the machine not assembled until last month.

Mr. CHOATE. Without waiving the objections to the questions put on direct examination, the defendants propound the following questions *de bene:* —

Cross-Int. 35. In answer to Mr. Webster's questions, you examined the drawings attached to certain patents which he showed you, and you stated that the machine Exhibit 208 was constructed as shown in the drawings attached to two of those patents, namely, 473,870 and 474,774, with one exception. Do you mean that Exhibit 208 embodies all the features exhibited in drawings in 473,870?

Ans. Yes.

Cross-Int. 36. And do you mean that Exhibit 208 embodies all the features shown in the drawings attached to patent 474,774?

Ans. Yes.

Cross-Int. 37. And one feature taken from patent 424,966?

Ans. Yes.

Cross-Int. 38. Which feature was selected by you?

Ans. I believe I said *h*'.

Cross-Int. 39. You spoke of a spring; I want to know who selected that feature for embodiment in Exhibit 208. Did you do it, or did Mr. Webster, or did Mr. Long?

Ans. I picked it out; I believe I said *h*'; I should have said Figure 4.

Cross-Int. 40. You should have said Figure 4?

Ans. Yes.

Cross-Int. 41. What is Figure 4?

Ans. Locking gate.

Mr. WEBSTER. Now, Mr. Choate, do you think it is fair to interpose my name in there?

Mr. CHOATE. As I understood, on the examination before he said that he copied this machine under your direction.

Mr. WEBSTER. I do not think he has said that. My understanding is that he intended to testify and did testify that I told him he had a right to manufacture machines under expired patents.

Mr. CHOATE. Is there any question but you were the patent

adviser for R. H. Long before you became the patent adviser of the United States?

Mr. WEBSTER. It has nothing to do with it, has it?

Mr. CHOATE. I think it has something to do with it.

Mr. WEBSTER. I acted as one of Mr. Long's attorneys; I do not see any reason why you should insert my name in the record. You can if you want to.

Mr. CHOATE. Well, I think I will leave the question as it is. If the association is a proper one, I do not see why you should have any objection. I am quite sure that Mr. Doidge did say in his previous examination that this machine was copied at your suggestion.

Mr. WEBSTER. I challenge the statement upon the record.

Cross-Int. 42. You said that this machine Exhibit 208 was a successfully operating machine?

Ans. Yes, sir.

Cross-Int. 43. Was more than one of them made by the company with which you and Mr. Long were associated?

Ans. Yes, sir.

Cross-Int. 44. And did each embody the locking gate feature of which you have just spoken?

Ans. I believe I said that some of the features shown in 424,966 were embodied in the machine. I did not say that particular construction was embodied.

Cross-Int. 45. My question was: Did each of these successfully operating machines embody the locking gate feature that you have just spoken of?

Ans. Yes, sir.

Cross-Int. 46. Was that machine given a name as connected with Mr. Long, or with your company?

Ans. Do you mean the trade-name of the machine?

Cross-Int. 47. Yes.

Ans. Yes.

Cross-Int. 48. What was the name?

Ans. The Waldorf stitcher.

Cross-Int. 49. The Waldorf was the name of the shoe which Mr. Long manufactured?

Ans. There is such a shoe manufactured. I do not know who manufactures it.

Cross-Int. 50. Mr. R. H. Long is at the head of the company that makes the Waldorf shoe?

Ans. I don't know who is at the head of the company that makes the Waldorf shoe.

Cross-Int. 51. What is the name of your company?

Ans. The R. H. Long Machinery Company, Incorporated.

Cross-Int. 52. Is he connected with that company?

Ans. Yes, sir.

Cross-Int. 53. In what capacity?

Ans. Treasurer.

Cross-Int. 54. You, at some time, have testified that portions of Exhibit 208 were copied from similar parts of a machine leased from the United Shoe Machinery Company, have you not?

Ans. I don't believe so.

Cross-Int. 55. Well, is it the fact?

Ans. What is 208? [*Examines Exhibit 208.*] Now, what is the question?

Cross-Int. 56. [*Question repeated by stenographer.*]

Ans. I believe so; some time in 1907.

Cross-Int. 57. Well, it is the fact, isn't it?

Ans. I presume it must be if I stated it at that time.

Cross-Int. 58. And you testified that it was the only machine which you copied from the United Shoe Machinery Company's machines?

Ans. Do you mean by that, was one machine made? I don't think I understand the question.

Cross-Int. 59. No. I mean it was the only type of machine of which you made a copy.

Ans. The only type of the stitcher machine, or any machine?

Cross-Int. 60. Yes.

Ans. Yes.

Cross-Int. 61. Is that right?

Ans. Yes, that is right.

Cross-Int. 62. You testified that Exhibit 209 embodied the feat-

ures of certain patents which you named, which were 412,704, 488,505 and 518,911. Did Exhibit 209 embody all of the features of those three patents?

Ans. I shall have to examine the patents. [*Examines patents.*] It embodied all shown in 518,911 and 488,505; also some of the features shown in 412,704.

Cross-Int. 63. But not all?

Ans. Not all of them.

Cross-Int. 64. And it did not embody all of the features in 317,-759?

Ans. No, sir, it did not.

Cross-Int. 65. Did the patented features of which you have just spoken, embodied in the machine, comprise the entire machine, or were there parts of the machine in which those patented features were not embodied?

Mr. WEBSTER. Question objected to because it calls for the construction of what was not patented. The direct examination related only to a comparison of drawings and specifications, but not as to what was or was not patented. And the witness is instructed that he is not required to answer as an expert as to what is or is not patented.

Ans. There were parts of the machine in which those patented features were not embodied.

Cross-Int. 66. Was Exhibit 209 constructed in detail like the drawings attached to the patents the numbers of which you have given?

Ans. Not in all respects.

Cross-Int. 67. Do you mean that there were variations in size and form and feature of the details?

Ans. No; I did not mean that.

Cross-Int. 68. In some respects 209 differed in detail as to the size of the parts shown in the patent?

Ans. Most assuredly.

Cross-Int. 69. And in some respects as to the shape of the parts?

Ans. Yes, sir.

Cross-Int. 70. So that 209 is not an exact reproduction of the machine shown in the drawings attached to these patents?

Ans. No, sir; not in all respects.

Cross-Int. 71. And the modifications or alterations or variances were suggested by you?

Ans. I beg pardon?

Cross-Int. 72. Were the modifications or alterations or variances from the drawings suggested by you?

Ans. Well, I think I pointed out —

Mr. WEBSTER. What are you talking about now? The stitcher or the welter?

Mr. CHOATE. The welter.

[*Ans. continued:*] — I think I pointed out some of them.

Cross-Int. 73. And advised them?

Ans. Advised what?

Cross-Int. 74. Advised these differences?

Ans. I advised that there were such differences between the machine and the drawing.

Cross-Int. 75. I mean at the time the machine was made, did you advise that there were such differences?

Ans. That question has not come up, and I have not answered to that effect.

Mr. WEBSTER. Let me make a suggestion. You are laboring under the impression that he built the welter, and he did not. It is the United welter.

Cross-Int. 76. Let me ask you as to Exhibit 208. Was that machine in detail like the drawings shown in the patents that you referred to in connection with it?

Ans. Yes, with the exception of the differences that I pointed out.

Cross-Int. 77. Well, that was with reference to the locking gate?

Ans. The locking gate was one. There were some differences.

Cross-Int. 78. And spring?

Ans. And spring; yes, sir.

Cross-Int. 79. I mean as to detail of the size and shape of the

different parts; were they exactly as shown in the drawings attached to the patents?

Ans. There was a difference in cam in patent 473,870, outside of those I noted, the spring and lock gate.

Cross-Int. 80. Where was the photograph 209 taken?

Ans. In the needle room of the R. H. Long Machinery Company, South Framingham.

Cross-Int. 81. And how long had that machine been in the possession of the R. H. Long Machinery Company?

Ans. I could not tell you that.

Cross-Int. 82. Well, how long do you remember of its being there?

Ans. It has been there since I went there.

Cross-Int. 83. How many years is that?

Ans. I would like to modify that, to say that to the best of my knowledge it has been there since 1907, — in storage.

Cross-Int. 84. It was there when you came?

Ans. Not in that building.

Cross-Int. 85. Has it been in storage ever since you have been there?

Ans. Practically so.

Cross-Int. 86. It has not been in use?

Ans. Not to my knowledge.

Cross-Int. 87. The knowledge which you testified to, as to the successful operation of the stitching machine, had reference to the Waldorf stitcher?

Ans. Yes, sir.

Cross-Int. 88. And you expressed no knowledge, but only a belief, as to the welter of which you were asked, Exhibit No. 209?

Ans. That is correct.

Cross-Int. 89. Your machinery company has made no such welters?

Ans. No, sir.

Cross-Int. 90. And so far as Exhibit 209 itself is concerned, it has never been operated since you have been at the factory?

Ans. Not to my knowledge.

Cross-Int. 91. When you examined it yesterday, was it complete in all its parts or had anything been taken out of it?

Ans. Nothing removed to my knowledge. It was complete, so far as I know.

Cross-Int. 92. Can you say one way or the other?

Ans. I am quite positive the machine is complete in all its details.

Mr. CHOATE. That is all.

Direct Examination resumed by Mr. WEBSTER.

Int. 93. In cross-examination you were asked with reference to the particular stitching machine of which photograph Plaintiff's Exhibit 208 is a picture. State whether machines constructed like that machine have gone into successful use.

Ans. Yes, sir.

Mr. WEBSTER. That is all.

Cross Examination resumed by Mr. CHOATE.

Cross-Int. 94. I desire to ask one more question. The use of the machine photographed in Exhibit 208 is mostly by cobblers, isn't it, — shoe cobblers?

Ans. To a great extent; yes.

Cross-Int. 95. Now, Exhibit 209, you have said, had two plates on it; the head had a plate marked "No. 1941", the base had a plate which was marked "No. 423"?

Ans. Yes, sir.

Cross-Int. 96. Do you know when that head was put upon that base?

Ans. No, sir.

Cross-Int. 97. Or whether or not it was done there at your factory?

Ans. I don't believe it was done in the factory. It was taken right out of storage.

Cross-Int. 98. I say, do you know?

Ans. No, I do not know.

Cross-Int. 99. Did you have the machine taken out of storage?

Ans. Yes, sir.

Cross-Int. 100. Was it crated up when you took it out of storage?

Ans. No, sir.

Mr. CHOATE. That is all.

JOHN J. DOIDGE.

Attest: CHARLES K. DARLING, *Special Examiner.*

DEPOSITION OF CHARLES McCORMACK CHAPMAN.

Direct Examination by ALLEN WEBSTER, Esq., *of Counsel for Complainant.*

Int. 1. Please state your name, residence and profession.

Ans. Charles McCormack Chapman; age, forty-six; residence, New York City, State of New York; occupation, patent solicitor and patent expert.

Int. 2. Please state your education, experience and studies tending to fit you to testify with reference to patents and machines and a comparison between the two.

Ans. Education obtained in the public schools of the District of Columbia and the State of New York. Was graduated from the George Washington University, District of Columbia, with degrees of LL. B., LL. M., and Master of Patent Law. Was for over fourteen years an assistant examiner on the examining corps of the United States Patent Office, and for upwards of ten years have been practicing my profession. While in the Patent Office my duties involved the examination of applications for patents, comparison of claims contained therein with prior art structures, construction of claims in applications and patents, study of patents, inventions covered by them, and by applications filed in the Patent Office, and such other incidental duties as are necessarily involved in performing services as an assistant examiner upon the examining corps of the Patent Office. During the practice of my profession, in the past ten years, I have on numerous occasions rendered opinions concerning patents and the patentable novelty of inventions covered by them, have had occasion to construe and interpret claims of patents and apply the latter to machine structures. I have also had occasion to study the machine built under patents or in accordance

with them, and make comparisons of the same with other machines illustrating prior art. I have on several occasions given expert testimony for use in the Federal courts.

While in the Patent Office and for upwards of ten years I was employed on the class of sewing machines and during that period made a special study of and became familiar with all classes and types of machines having reference to shoe sewing and, in many instances, became familiar with other machines, incidental to shoe manufacturing. Since starting upon my professional career I have had occasion to make a special study of shoe-sewing machines and witness the practical operation of such machines and minutely examine the structures and modes of operation thereof.

Mr. WEBSTER. Mr. Choate, do you desire to examine the witness with with reference to his qualifications?

Mr. CHOATE. I will keep that until the general cross-examination.

Int. 3. Kindly examine the photograph I now hand you, the same being marked "Plaintiff's Exhibit 209"; and state whether you identify the photograph; whether you were present when it was made, and whether you examined the machine illustrated in the photograph [*handing to witness Plaintiff's Exhibit 209*].

Ans. I have examined the Plaintiff's Exhibit No. 209 and identify the machine portrayed therein as one which I examined in one of the buildings of the R. H. Long Machinery Company at South Framingham, Massachusetts. This machine was photographed in my presence in that building, and in the presence of Mr. Doidge and Mr. Webster, counsel for the United States.

Int. 4. You did not say when. I don't know as I asked you when you examined it.

Ans. The machine was photographed yesterday, July 28, 1913.

Int. 5. Kindly state whether you examined the machine of which Plaintiff's Exhibit 209 is a photograph, and compared the same with patents.

Ans. I did examine such machine and made comparisons thereof with certain patents.

Int. 6. Kindly examine copies of patents marked "Plaintiff's Exhibits 213", "214", "215", "216" and "217", the same being

copies of patents referred to, with one exception, by Mr. Doidge, and state whether the welting machine examined by you yesterday of which Plaintiff's Exhibit 209 is a photograph, is constructed and operates as set out in the machine patents referred to in the question. State also what marking, if any, you found on the welting machine.

Mr. CHOATE. Please note the defendants' objection to the question as not within the scope of the order, and as immaterial, incompetent and inadmissible.

Ans. The machine which I examined yesterday and on several previous occasions, and which is portrayed in Plaintiff's Exhibit 209, has two name plates, one containing the following being the top plate or plate applied to the head of the machine: "The property of the United Shoe Machinery Company, Lessor, Goodyear Department, Goodyear Welt and Turn Shoe Machine, No. 1941." On the bottom plate applied to the upper portion of the stand, the following: "423, Welt and Turned Shoe Machine. Patented. The Property of the Goodyear Shoe Machinery Company, Lessor, Boston, Mass."

Referring first to Plaintiff's Exhibit 214, being French and Meyer patent No. 412,704, I made a very careful comparison of the machine of Exhibit 209 with said patent and found said machine to contain in all material respects substantially the same structure illustrated in the drawings of the said Plaintiff's Exhibit 214. One difference in the machine as compared with said Exhibit 214 is the structure of the auxiliary take-up illustrated in Plaintiff's Exhibit 216, being patent of Briggs No. 518,911. Another difference is that the machine of Exhibit 209 has not therein the particular structure of mechanism for actuatiug the welt guide; that is to say, the structure contained in this Exhibit No. 213, being patent to French No. 317,759, is not contained in said machine Plaintiff's Exhibit 209.

Int. 7. You mean the machine illustrated in Plaintiff's Exhibit 209?

Ans. I am assuming that the machine and photograph are identical. This is also true of the structure illustrated in Figs. 3 and 4 of the drawings of Plaintiff's Exhibit 213. That is to say, the

so-called "sticker bar" is not contained in the machine of Plaintiff's Exhibit 209.

I found in the machine of Plaintiff's Exhibit 209 a portion of the structure illustrated in Plaintiff's Exhibit 215, being patent to LaChapelle No. 488,505. That is to say, I found in the said machine of Plaintiff's Exhibit 209 a device by means of which when the machine is brought to a standstill and the driving-shaft reversed to a predetermined position, the tension is released on the rolling tension device at the back of the machine. The portrayal of the structure in Fig. 3 of the said LaChapelle patent, Plaintiff's Exhibit 215, of the means by which the tension is released at a predetermined time, is not very clear, but the structure as contained in the machine of Plaintiff's Exhibit 209 would appear to be substantially as that of the said Fig. 3 of the LaChapelle patent, Plaintiff's Exhibit 215.

In examining the machine of Plaintiff's Exhibit 209 and comparing the same with Plaintiff's Exhibit 214, French and Meyer patent 412,704, I was careful to examine the various cam paths cut in the several discs carried by the driving-shaft, and to also, by operating the machine, obtain the various positions of parts portrayed in the several figures of the said French and Meyer patent Plaintiff's Exhibit 214, to verify the mode of operation of the machine of Plaintiff's Exhibit 209 with that operation which is illustrated by the said patent Plaintiff's Exhibit 214. In so doing, I found that the mode of operation of so-called method of forming chain stitches illustrated in Plaintiff's Exhibit 217, being patent to Briggs 461,793, was carried out in all material and substantial respects. A difference, however, between the two in favor of the machine of Plaintiff's Exhibit 209 and Plaintiff's Exhibit 214, French and Meyer patent 412,704, was observed by me in that feature of the finishing stroke of the needle which results in the complete setting of the stitch, which appeared to have been omitted from the Briggs patent structure, Plaintiff's Exhibit 217. I believe that answers the question.

Int. 8. State whether the welter examined by you yesterday and with reference to which you are now testifying was constructed

and operated as set out in the several machine patents you have referred to, and as referred to in the claims of said patents.

Mr. CHOATE. Note the defendants' objection to the question as not within the scope of the order and as inadmissible and immaterial.

Ans. With the exceptions heretofore noted the machine of Plaintiff's Exhibit 209 is constructed and operates substantially as set forth in the several patents referred to by me. There are claims in the patent 317,759, Plaintiff's Exhibit 213, which cover a construction not contained in the machine of Plaintiff's Exhibit 209. The claims I refer to are numbered 5 and 6 in the said Plaintiff's Exhibit 213, claim 5 referring to the means for varying the extent of, and the positive throw of, the welt guide slide, and the other claim, No. 6, referring to the sticker bar and means for actuating the same.

Int. 9. Kindly advise whether you have knowledge of a prior art as affecting the Briggs method patent, Plaintiff's Exhibit 217; and, if so, state what it is.

Mr. CHOATE. Note the defendants' objection to the question as not within the scope of the order and as immaterial and inadmissible.

Ans. In the prior art I found a patent granted to Stickel April 1, 1884, No. 296,084, for hand apparatus for forming stitches, which in the description of the mode of operation of the instrument made the subject of said patent describes the Briggs method of Plaintiff's Exhibit 217. The descriptive portion of the patent to Stickel referred to by me is that setting forth the mode of operation of the instrument in making chain stitches.

[*The copy of patent to Stickel offered in evidence and marked "Plaintiff's Exhibit 218".*]

Mr. CHOATE. Please note the defendants' objection to the introduction of the exhibit as not within the scope of the order and as incompetent, inadmissible and immaterial.

Mr. WEBSTER. In this connection, counsel for the United States offers copy of opinion and decree in the case of United Shoe Machinery Company *v.* Duplessis Company, as reported in Federal

Reporter, Vol. 155, page 842, Circuit Court of Appeals, First Circuit, the same having special reference to a controlling patent to French and Meyer, No. 412,704, in which it is held that said patent expired —

Mr. CHOATE. Do you think you should state what is held as long as you put in your exhibit?

Mr. WEBSTER. — in which the Government contends it is held that said patent expired September 17, 1902. I have not that copy here. Do you want to put it in later?

[*Opinion and decree referred to offered in evidence and marked "Plaintiff's Exhibit 219".*]

Mr. CHOATE. I shall object to it as not being within the scope of the order and as not the best evidence, and as incompetent and inadmissible and immaterial.

Int. 10. Kindly state whether you were present when photograph Plaintiff's Exhibit No. 208 was made, and whether you examined the machine therein illustrated in comparison with the patents, and when the photograph was made, if you know.

Ans. The machine portrayed in the photograph of Plaintiff's Exhibit No. 208 was photographed in my presence yesterday, July 28, 1913, and in the presence of Mr. Doidge and Mr. Webster, in one of the buildings of the R. H. Long Machinery Company at South Framingham, Massachusetts. I made a careful examination of this machine of the said Exhibit No. 208 with patents July 28, 1913, at South Framingham, Massachusetts.

Int. 11. Kindly state with what patents you made comparison of said machine and whether the machine so examined by you was constructed and operated as shown in said patents.

Ans. The patents which I examined and compared with the machine of Plaintiff's Exhibit 208 are Plaintiff's Exhibit 210, being French and Meyer patent No. 474,774; Plaintiff's Exhibit 211; Plaintiff's Exhibit 212, being French and Meyer patent No. 473,870. With the exception of a few immaterial details, I found the machine of Plaintiff's Exhibit 208 to be in all material respects substantially the same as that illustrated in the drawings of the Plaintiff's Exhibit 202, being French and Meyer patent 473,870. I also

found the machine of Plaintiff's Exhibit 208 to contain the structure, excepting one or two immaterial details illustrated in the Plaintiff's Exhibit 210, French and Meyer patent, 474,774. I found that the machine of the Plaintiff's Exhibit 208 in certain features differed quite materially from Plaintiff's Exhibit No. 211, being French and Meyer patent 424,966. The important point of difference resides in the structure of the bobbin case holding means, which is covered by the claims and portrayed in the drawings of Plaintiff's Exhibit 211, French and Meyer patent 424,966. Another difference between the last said exhibit and the machine of Plaintiff's Exhibit 208 resides in the means by which the thread is led from the bobbin to the outside of the shuttle, the machine of Plaintiff's Exhibit 208 being devoid of that particular means which is referred to and illustrated in Figures 1 and 2, and in details in Figure 3 of Plaintiff's Exhibit 211, French and Meyer patent 424,966.

Int. 12. Please state whether you found the machine of Plaintiff's Exhibit 208 to be constructed and operating as referred to in the claims of the several patents.

Mr. CHOATE. Please note the defendants' objection in the same phraseology as last given.

Ans. The structure called for by the three claims of Plaintiff's Exhibit 211, French and Meyer patent 424,966, is not contained in the machine of Plaintiff's Exhibit 208. The structure covered by the claims of Plaintiff's Exhibit 210, French and Meyer patent 474,774, is answered in all material respects by the machine of Plaintiff's Exhibit 208. With the possible exception of claims 8 and 10 of the Plaintiff's Exhibit 212, French and Meyer patent 473,870, the claims of said exhibit describe a structure contained in the machine of Plaintiff's Exhibit 208.

Int. 13. Should you say, from your knowledge, study and experience, that the patents to which you have referred in your deposition might properly be termed "basic patents" early in 1899, in reference to the machines in question, welters and stitchers?

Mr. CHOATE. Note the defendants' objection to the question as not within the terms of the order, as leading, inadmissible, incom-

petent and immaterial, and because the word "basic" has no recognized or accepted meaning with reference to the subject-matter.

Mr. WEBSTER. Attention is called to the fact that the words "basic patents" are found in the allegation of the petition, the paragraph beginning at the foot of page 15. For this reason the term is employed by counsel.

Mr. CHOATE. You may note the further objection that the inquiry, if material, relates to a matter to be decided by the court and not testified to by the witness.

[*The question is read.*]

Ans. Yes, with the exception of a few detailed claims contained in some of the patents examined by me, and with the exception of such patents as do not date back as early as 1899.

Int. 14. Just what do you mean by "do not date back"?

Ans. Some of the patents examined by me are not as early as 1899. In answering the foregoing question, I had in mind several patents which I examined in connection with those of the exhibits heretofore referred to by me; but in looking over the said exhibits I find that my answer is misleading, — that is, of the exhibits there are no patents subsequent to the year 1899.

Int. 15. Please explain what you mean by "patents subsequent"; that is, whether you mean patents the applications for which were filed in 1899.

Ans. I mean patents dated subsequent to the year 1899.

Mr. WEBSTER. You may inquire.

Mr. CHOATE. Does that complete your direct examination?

Mr. WEBSTER. So far as at present advised. I may think of something for which I pray your indulgence.

Mr. CHOATE. We should like, if convenient to you, to suspend until 2 o'clock tomorrow the cross-examination.

Mr. WEBSTER. I should be glad to accommodate you, Mr. Choate, at any time.

[*Adjourned to 2* P. M., *Wednesday, July 30, 1913.*]

BOSTON, MASS., July 30, 1913.

Mr. CHOATE. Is there anything further you have to ask of Mr. Chapman?

Mr. WEBSTER. I do not think of anything now. There may be something later on.

Mr. CHOATE. There may be something that you have forgotten?

Mr. WEBSTER. Yes. If I have anything further, I presume it will develop.

Mr. CHOATE. Except that you may have inadvertently overlooked something, you have completed your examination?

Mr. WEBSTER. Yes. I am not hiding anything.

Cross Examination by FREDERICK P. FISH, Esq., *of Counsel for Defendants.*

Mr. FISH. Cross-examination *de bene esse*, and without waiving objection.

Cross-Int. 16. During what period of ten years were you employed on the class of sewing machines in the Patent Office?

Ans. I first went on to the class of sewing machines in the middle of the year 1886, and remained on that class until my resignation in 1902.

Cross-Int. 17. Referring to the Stickel patent, April 1, 1884, No. 296,084, for hand apparatus for forming stitches, you have stated that that patent, in the description of the mode of operation of the instrument made the subject of said patent, describes the Briggs method of Plaintiff's Exhibit 217, and that the descriptive portion of the patent to Stickel so referred to by you is that setting forth the mode of operation of the instrument in making the chain stitches. Please compare the mode of operation of the instrument of the Stickel patent in making chain stitches with the method patented in the Briggs patent as defined in the claim, and state definitely the resemblances and the differences between them in order that the exact meaning of your testimony on direct may be clear.

Ans. In the Stickel patent the method of making chain stitches is illustrated in Figures 4, 5, 6 and 7. The process or method for making said chain stitches, as illustrated in those figures, is

described on page 2 of the patent description, beginning in the paragraph line 6 and ending with line 31, page 2, Figure 11 being referred to as the culmination of the steps of the process thus described. The method of the Briggs patent, Plaintiff's Exhibit No. 217, involves the following steps: First, "passing a loop of thread through a hole in the materials", this step being illustrated in Figure 4 of the Stickel patent, wherein several chain stitches are illustrated as having been completed and another stitch started, the loop thereof indicated by S being shown about the body or stock of the needle; second, "inserting an instrument through the loop and holding the instrument in a second hole in the materials at the point desired for the next stitch", this step likewise being illustrated in Figure 4 of the Stickel patent, wherein the instrument, *including* the hooked needle, is shown thrust through the materials and entered also in the loop S of the stitch about to be made. In the hand operation of the instrument of the Stickel patent the needle is held as called for in this second step of the Briggs method; third, drawing on the supply end of the thread. This step is illustrated in the Stickel patent in that operation of the operative wherein he takes hold of the end of the thread indicated by Z in all the figures but not indicated by Z in Figure 4. This supply end of the thread is drawn upon by the operative for the purposes and to produce the position shown in Figure 5 of the Stickel patent, the fourth step of the Briggs method being "thus drawing the loop that is now around the instrument against the material". This step of the Briggs method is illustrated in Figure 5 of the Stickel patent, wherein the operative has drawn upon the supply end of the thread and looped it about the holder and engaged it in the hook of the needle and thus drawn the loop indicated in Figure 4 as S about the stock of the needle, as clearly shown in Figure 5 of the Stickel patent. Fifth, "forming another loop from the supply thread on the opposite side of the materials". This step of the Briggs method is also illustrated in Figure 5 of the Stickel patent, the said other loop being that which is in sight, Figure 5, in the hook of the needle. Sixth, "removing the instrument from the second hole in the materials and from the drawn down loop", this step being illustrated in suc-

cession in Figures 5, 6 and 7 of the Stickel patent, wherein the second loop of thread is drawn through the second hole and also through the drawn down loop, which latter, as shown in Figure 7 of the Stickel patent, now lies snugly against the surface of the material in the direct line of sight, the second loop in the said Figure 7 of the Stickel patent remaining in the hook of the needle and being shown as pulled through the preceding loop referred to in the said last step of the Briggs method as the "drawn down loop". Seventh, "and passing the second loop made from the supply thread through the second hole in the materials and through the drawn down loop", this step being also illustrated in Figure 7, as above described.

Cross-Int. 18. Does the man who is operating the Stickel tool grasp the thread with his fingers or hand at the point Z of No. 5, 6 and 8 and at the corresponding point of No. 4 of the drawings?

Ans. According to my understanding; yes.

Cross-Int. 19. Does he maintain his hand throughout the operation permanently in position and without moving it, or is he obliged to move it at all, as by a pull?

Ans. Do you mean with reference to Figure 4, or the other figures?

Cross-Int. 20. My question relates to the entire operation from No. 4 to No. 7 of the drawings.

Ans. With the understanding of your last statement, the operator holding the supply end of the thread as at Z necessarily manipulates the thread so as to loop it about the yielding holder as well as the needle, to place the thread in the hook of the needle to form the successive loops.

Cross-Int. 21. Is that all his active participation in the operation in so far as his manipulation of the thread at Z is concerned?

Ans. So far as my observation and my understanding of the mode of manipulating the instrument of the Stickel patent is concerned; yes.

Cross-Int. 22. What is it that transforms the open loop S of No. 4 to the corresponding loop S of No. 5, which seems to be drawn down?

Ans. Primarily, manipulation of the instrument by the handle thereof to seek a succeeding position in the materials, and simultaneously therewith carrying the loop drawn through the material by the hooked needle into the second position for penetration; secondly, manipulation of the supply end of the thread to draw the said first loop into position shown in Figure 5 prior to drawing the second loop through the materials and into and through the first loop.

Cross-Int. 23. You have named two actions. Are both involved in the transformation of the loop S at No. 4 into its condition in No. 5?

Ans. Yes.

Cross-Int. 24. Exactly how does the first agency act in so doing?

Ans. The hand of the operator manipulating the instrument by its handle draws a loop of thread through the material, the thread having previously been looped about the holder and the needle as in Figure 5, and also drawing the loop on the shank of the needle on the opposite side of the material, and the movement of the instrument bodily laterally or toward the left of Figure 4 in order to seek a new point for penetration of the instrument.

Cross-Int. 25. Do you mean that the movement of the needle laterally to the left of figure 4 transforms the loop S of Figure 4 into the condition in which the same is shown in Figure 5?

Ans. Oh, no. You asked me about the operation of the first instrumentality. The first instrumentality referred to by me was the hand of the operator manipulating the instrument by its handle.

Cross-Int. 26. Now I ask you how the hand of the operator manipulating the instrument by its handle transforms the loop S of No. 4 into the form in which the same appears in No. 5?

Ans. I described that operation fully in my preceding answer and stated two instrumentalities.

Cross-Int. 27. I am referring only to the first instrumentality.

Ans. I have not stated that the first instrumentality alone accomplishes that result. The second instrumentality aids in accomplishing that result.

Cross-Int. 28. To what extent does the first instrumentality in and of itself contribute toward accomplishing that result?

Ans. Without it the result could not be accomplished at all; therefore, it aids very materially in accomplishing the result.

Cross-Int. 29. How far in and of itself, without reference to the second instrumentality, is the result accomplished by the first instrumentality?

Ans. The first instrumentality primarily locates the loop of the stitch; secondarily, acts as the snubbing post around which each loop is drawn tightly and snugly against the material, and, thirdly, accomplishes the result of drawing the second or succeeding loops through each preceding loop.

Cross-Int. 30. And what draws the loop about this snubbing post?

Ans. The hand of the operator drawing upon the supply end Z of the thread, plus the interposition of the holder and the end or hooked end of the needle.

Cross-Int. 31. Starting with the condition of things shown in No. 5, does the hook of the needle continuously bear against the same point on the thread in proceeding from No. 5 to No. 6 and to No. 7?

Ans. Maybe and maybe not, depending entirely upon the operator.

Cross-Int. 32. Please explain the conditions under which it may be so and may not be so and the nature and occasion for the intervention of the operator to cause one or the other condition of operation.

Ans. Assuming that the supply comes from a spool or cop or holder for the thread held in the left hand of the operator and that the right hand of the operator grasps the handle of the instrument, the proper operation of the device or instrument in making the chain stitches according to the Stickel patent would be substantially as follows: Assuming several stitches to have been made, as illustrated in both Figures 4 and 5, a loop of the thread will be drawn through the materials, the hole through which said loop may be drawn having first been made by the hooked needle being pushed through the materials from front to rear. By withdrawing the needle from the material, a loop of thread will be formed on the

front side and will be held in the hook of the needle. The needle will then be shifted with the instrument bodily toward the left and the point of the needle will be placed at the position next desired for a stitch.

The needle will then be pushed through the material from front to rear, still holding the first loop laid in its hook, and passing its shank clear into that first loop, thus positioning the hook of the needle so that a second loop may be formed therein. The second loop will then be formed by first casting the supply end of the thread with the left hand or other hand of the operative about the holder — described in the Stickel patent as finger *d* — and in the hook of the needle. At the same time the operative with his left hand, pulling upon the supply end, draws the loop now about the shank of the needle tightly down about the latter, thus laying that loop upon the face of the fabric snugly against the same. In this position with parts as illustrated in Figure 5 a new loop or second loop will be pulled through the material and also drawn through the preceding loop, the right hand of the operative manipulating the instrument so as to produce this result. The instrument will then again be moved to the left, with the second loop in the hook of the needle, and a new position will be sought and the needle pushed through the material at that position. Successive steps will be carried out as previously described.

Mr. FISH. Objected to as altogether irresponsive.

[*The question is repeated.*]

The WITNESS. The only other condition that I can see called for by the question is that if the instrument is not properly manipulated, and if the left hand of the operator does not properly control the supply end Z of the thread, then it is possible that the thread may reeve in the hook of the needle. On the contrary, if the supply end of the thread Z is properly held and manipulated, that condition will not occur.

Cross-Int. 33. Fitting the action of the operator definitely and precisely to the conditions shown in No. 5, will you state how he is to manipulate the thread which he holds at Z in such a way that

the hook of the needle will bear constantly upon the same point on the thread during its subsequent operations?

Ans. As illustrated in Figures 5 and 6, and assuming the manipulation of the instrument through those two figures to the position of Figure 7, if the operator properly controls the Z end of the thread he will prevent it from reeving in the hook of the needle, and will in manipulating the instrument give up the supply end of the thread proportionately with the movement of the needle rearwardly through the material into the position of Figure 7. This will result under the tension of the holder *d* in drawing and making the loop entirely from the thread extending from the hook of the needle to the material.

Cross-Int. 34. In Figure 5 the lowest thread of the loop S' is shown as extending from the fabric to the finger, which in Figure 2, for example, is marked "*d*". In No. 6 it is also shown as extending from the fabric to that finger, but the distance from the fabric to the finger is very much less. What has happened to that portion of the thread that has moved somewhere during the operation from No. 5 to No. 6?

Ans. By the manipulation of the supply end of the thread in casting it about the holder *d*, the operative has drawn upon the loop upon the face side of the material and tightly drawn that loop around the shank of the needle and snugly against the face of the material. The hook of the needle, in the meantime, by manipulating the instrument has been drawn closer to the rear face of the material and the operator has either at that time or at a period slightly before that time placed the thread in the hook of the needle and used the latter as an aid to drawing in the preceding loop.

Cross-Int. 35. And during that operation from No. 5 to No. 6, has or has not the thread rendered through the hook of the needle?

Ans. It may be so and it may not be so.

Cross-Int. 36. Isn't it inevitable that it should be so?

Ans. No.

Cross-Int. 37. Why not?

Ans. Because the operative, instead of tightening the supply end of the thread in the hook of the needle, as shown in Figure 5, may

wrap it about the shank of the needle below the hook, and thus draw in the thread to assume the position of Figure 6. He may then cast the thread into the hook of the needle as shown in Figure 6.

Cross-Int. 38. Of course, absolutely nothing of the sort is shown in No. 5, and you are clearly not entitled to advance any such hypothesis unless the specification justifies it. Where do you find such a suggestion in the specification?

Ans. The description of this patent to Stickel is, as I understand it, directed to those skilled in the art and not to novices; the description of the mode of producing a Stickel stitch is so clear to my mind that with the ordinary intelligence of the average operative the results described by me will necessarily be attained.

Mr. FISH. Objected to as irresponsive and volunteered. The question will be repeated.

[*The question is read.*]

The WITNESS. If my answer is not responsive, kindly explain in what particular.

Cross-Int. 39. Where do you find in the specification the suggestion of a mode of operation and of manipulation which you have made?

Ans. I first refer to the description of the Stickel patent, page 1, beginning on line 31. Next, page 1, beginning on line 54 and ending on line 72. Next, page 2, beginning on line 6 and ending on line 31.

Cross-Int. 40. You have referred to a great part of the descriptive matter of the specification. Can you not put your finger on any statement which justifies you in the hypothetical action which you have suggested?

Ans. The action which I have suggested is not hypothetical. On the contrary it is based on the description of the drawings of the Stickel patent, coupled with that necessary common sense of a skilled operative in manipulating the instrument for the purpose of producing the stitch described in the patent.

Cross-Int. 41. But it is not disclosed specifically in the specifications?

Ans. Why, the hands of the operator are not described in the

various manipulations of the tool, but those hand operations or manipulations of the instrument necessarily result from the clearly described mode of operation of the implement in the production of the stitch shown in Figure 11 through the several positions of Figures 4 to 7.

Mr. FISH. Objected to as irresponsive and voluntary. Question repeated.

[*The question is read.*]

The WITNESS. Please point out in what respect my answer is not responsive. I thought I had answered it fully.

Cross-Int. 42. The question related to a specific matter which the answer did not touch, even remotely. Question repeated.

[*The question is read.*]

Ans. Believing that my answers have been quite responsive, nevertheless I refer to the "process of making chain stitches as illustrated in Figures 4, 5, 6 and 7", which is set forth in the paragraph page 2, beginning line 6, of the Stickel patent. This description of mode of operation and process for producing the stitch illustrated in Figure 11 is my justification for the answers I have given as well as the mode of operation which I have described.

Cross-Int. 43. I call your attention to the following passage from and after line 15 of page 2 of the specification: —

"The thread is kept taut at Z, Fig. 5, and thereby the loop of the previous stitch on the top face of the leather is tightened. Then the tool is drawn back, the tension of the loop thereby increasing and swinging the movable finger inward toward the hook. The tension on the previous stitch will be constantly kept on until the needle with loop holder and finger has been drawn backward far enough so as to cause the loop of thread to slip off from the finger and to be drawn through the hole, as seen in Fig. 7."

Are these specific requirements of the specifications consistent with the hypothetical mode of operation which you have suggested?

Ans. I draw attention to the fact that in your quotation you omitted the words in brackets "[see Fig. 6]", which illustrates the tension position of the thread suggested in a portion of your quotation. Now, answering your question, there is no doubt that the

matter quoted by you is justification for the mode — not hypothetical — of operation described by me.

Cross-Int. 44. Loop S of No. 4 appears in a modified form in No. 5. Does it appear in No. 5 in its final form; and, if not, what further changes are there in it?

Ans. If by "modified form" you mean a different position, well and good, and assuming that to be your meaning my answer is that in the position of Figure 5 the same loop S has been drawn tightly about the shank of the needle and snugly against the face of the materials. This is not its final condition, that condition — final — not being reached until the needle has completely left in.

Mr. FISH. That is all, Mr. Webster.

Mr. WEBSTER. That completes the cross-examination of Mr. Chapman?

Mr. FISH. Yes.

The WITNESS. I would like to make a correction on the record.

Mr. FISH. There is one more question I would like to ask.

Cross-Int. 45. When was your attention first called to the Stickel patent with its relation to the Briggs patent?

Ans. If my memory serves me correctly, it was the year 1907, in the summer. I went to Washington for a client and made a search relative to the validity of the Briggs method and the claim of that patent. During that search I found the Stickel patent.

Mr. FISH. That is all, Mr. Webster.

The WITNESS. On typewritten page 2103 [printed page 2146] of the record in my answer with reference to Plaintiff's Exhibit 212, being French and Meyer patent 473,870, I stated that with the possible exception of claims 8 and 10 of that exhibit patent the claims of said exhibit described a structure contained in the machine of Plaintiff's Exhibit No. 208. I made that statement at that time because at the moment I could not remember whether the adjustments called for in claims 8 and 10 were present in the machine of Plaintiff's Exhibit 208. Since making that statement I have verified my recollection and claims 8 and 10 with the said exhibit machine, and find that the latter contains in all particulars the structure called for by claims 8 and 10. In making this veri-

fication I also discovered the fact that I omitted to state that claim 6 of the same patent exhibit is not found in the machine of Plaintiff's Exhibit 208.

Mr. WEBSTER. I do not think there will be any redirect, but in view of the fact that it is nearly time to close and I would like a little time to examine the record I will postpone the redirect examination until tomorrow. As at present advised, there will be no redirect examination of the witness. The postponement was had yesterday to enable the counsel for the defendants to prepare for cross-examination, and I apprehend there will be no objection to postponement of redirect until tomorrow.

[*Adjourned to 10* A. M., *August 14, 1913.*

Signature waived.]

Attest: CHARLES K. DARLING, *Special Examiner.*

DISTRICT COURT OF THE UNITED STATES,
DISTRICT OF MASSACHUSETTS.

IN EQUITY.

No. 301.

UNITED STATES OF AMERICA, PETITIONER,
v.
UNITED SHOE MACHINERY COMPANY, OF NEW JERSEY, ET AL.,
DEFENDANTS.

ORDER EXTENDING TIME FOR TAKING TESTIMONY BEFORE EXAMINER UNDER ORDER DATED JUNE 27, 1913.

August 8, 1913.

PUTNAM AND DODGE, JJ. (BROWN, J., *concurring.*) It is ordered (both parties consenting hereto) that the times for taking testimony under the order dated June 27, 1913, entitled "Order Directing the Taking of Testimony with Respect to Patents Before an Examiner" be extended two (2) weeks, the petitioner to be allowed until August 26, 1913, inclusive, for evidence in chief, the defendants to have until October 11, 1913, inclusive, for testimony in defence, and the petitioner to have to October 25, 1913, inclusive, for rebuttal.

By the Court,

CHARLES K. DARLING, *Clerk.*

The above-named parties hereby consent to the entry of the foregoing order.

July 31, 1913.

ALLEN WEBSTER,
Special Assistant to the Attorney General,
for Petitioner.
CHARLES F. CHOATE, JR.,
for Defendants.

BOSTON, MASS., August 14, 1913.

Mr. WEBSTER. Mr. Chapman, our expert, met with an accident. His eye is affected, and he is under a doctor's care. This may necessitate the asking for further time. I offer now —

Mr. CHOATE. Before leaving that matter I should like to call attention to the statement made by Mr. Webster at the last hearing, to the effect that he had concluded his examination of Mr. Chapman.

Mr. WEBSTER. I think you will find that I stated I had concluded the examination of Mr. Chapman with reference to those particular things. I certainly have not concluded with reference to other branches of the case, other patents and other machines.

Mr. CHOATE. Before we began the cross-examination of Mr. Chapman, I asked: "Is there anything further you have to ask Mr. Chapman?" You said: "I do not think of anything now. There may be something later on." I said: "There may be something that you have forgotten?" You said: "Yes. If I have anything further, I presume it will develop." I said: "Except that you may have inadvertently overlooked something, you have completed your examination?" You said: "Yes. I am not hiding anything." We should not have cross-examined except upon that statement.

Mr. WEBSTER. It has been my expectation to put Mr. Chapman on with reference to a vast number of patents and machines. I put him on with reference to welters and stitchers which he had examined, and patents on welters and stitchers, but I have always expected and now expect to put him on with reference to other machines and other patents. My statement, read from the record

by Mr. Choate, has reference to that examination with reference to those machines and those patents.

Mr. CHOATE. We should like to have it noted that we reserve any rights that we may have to object to Mr. Chapman being recalled.

Mr. WEBSTER. I suppose we have a right to recall a witness. I offer now in support of the notice that we may have to ask for an extension of time an affidavit by Mr. Chapman, and a certificate from Dr. Haskell. I do not think these ought to be made a part of the record. It is not a part of the case, but I will file the same with the examiner and furnish opposing counsel a copy if they desire.

The EXAMINER. These are filed with the clerk of the court?

Mr. WEBSTER. Filed with the examiner, I suppose.

Mr. CHOATE. I would like to see a copy of them.

[*Mr. Choate examines two papers filed by Mr. Webster with the examiner.*]

Mr. WEBSTER. I offer now the opinion and decree which was offered on page 2101 of the testimony [printed page 2145], to which Mr. Choate's objection was entered at the time.

Mr. CHOATE. Will you note it again now, please?

Mr. WEBSTER. The petitioner offers as an exhibit catalogue of Goodyear Shoe Machinery Company dated on the title page "Boston, Mass., January 1, 1897".

Mr. CHOATE. Is this something that has been referred to before, or something that you offer now?

Mr. WEBSTER. Something that I am offering now. I have not any copy of it. I wish you would furnish me a good copy, as this is somewhat mutilated.

[*Catalogue of Goodyear Shoe Machinery Company, January 1, 1897, introduced in evidence and marked "Plaintiff's Exhibit 220".*]

Mr. CHOATE. I would like to have our objection noted to the introduction of that exhibit. It is not within the scope of the order; it is not properly identified; it is incompetent, immaterial and inadmissible.

Mr. WEBSTER. Petitioner offers in evidence copy of United

States patents referred to by witness Howard as being patents the inventions of which were incorporated in machines and which patents expired after the organization of the United Company, and before the filing of the petition, the same being as follows: —

Patent of J. E. Crisp, tacking machine, dated October 27, 1885, No. 329,366;

Patent to Frank Chase, lasting machine for boots or shoes, dated March 16, 1886, No. 337,925;

Patent to Frank Chase, lasting machine, dated April 27, 1886, No. 340,860;

Patent to Frank Chase, machine for lasting boots or shoes, dated May 31, 1887, No. 364,088;

Patent to Frank Chase, lasting machine, dated January 10, 1888, No. 376,368;

Patent to Frank Chase, tack driving mechanism, dated September 27, 1892, No. 483,375.

[*Group of patents, relating to lasting machines, etc., as above enumerated, introduced in evidence, in one binder, and marked "Plaintiff's Exhibit No. 221".*]

Mr. WEBSTER. Petitioner offers also under the same heading patent to Matthias Brock, assignor to McKay & Copeland Lasting Machine Company, lasting machine, dated October 16, 1883, No. 286,898;

Patent to Matthias Brock, assignor to McKay & Copeland Lasting Machine Company, lasting machine, dated November 20, 1883, No. 288,689;

Patent to Matthias Brock, assignor to McKay & Copeland Lasting Machine Company, lasting machine, dated August 5, 1884, No. 302,885;

Patent to Matthias Brock, assignor to McKay & Copeland Lasting Machine Company, tack driving implement, dated October 14, 1884, No. 306,671;

Patent to Matthias Brock, assignor to McKay & Copeland Lasting Machine Company, lasting machine, deted October 18, 1887, No.371,816.

[*Group of patents to Matthias Brock, relating to lasting ma-*

chines, etc., as above enumerated, introduced in evidence, in one binder, and marked "Plaintiff's Exhibit No. 222".]

Mr. WEBSTER. The petitioner offers also under the same heading patent to George W. Copeland and Joseph E. Crisp, lasting machine, dated October 27, 1885, No. 329,282;

Patent to Copeland, Crisp and Grandy, lasting machine for boots or shoes, dated June 28, 1887, No. 365,505;

Patent to Copeland and Crisp, lasting machine, dated March 4, 1890, No. 422,734;

Patent to Crisp and Copeland, tack driving machine, dated February 17, 1891, No. 446,631;

Patent to Crisp and Copeland, tack driving machine, dated June 30, 1891, No. 455,174;

Patent to Copeland, Crisp and Grandy, lasting machine, dated December 15, 1891, No. 465,073;

Patent to Crisp and Junkins, tack driving machine, dated June 27, 1893, No. 500,225;

Patent to Crisp, tack driving machine, dated June 27, 1893, No. 500,319;

Patent to Grandy, lasting machine, dated June 26, 1894, No. 521,954.

[*Group of patents, relating to lasting machines and tack driving machines, as above enumerated, introduced in evidence, in one binder, and marked "Plaintiff's Exhibit 223".*]

Mr. WEBSTER. The petitioner offers also under the same heading patent to Allen, heel nailing machine for boots or shoes, dated January 6, 1885, No. 310,488;

Patent to Raymond, 2d, heel nailing machine, dated May 12, 1885, No. 317,851;

Patent to Towns and Raymond, 2d, nail making and distributing machine, dated July 27, 1886, No. 346,137;

Patent to Raymond, 2d, nail machine, dated October 22, 1889, No. 413,554;

Patent to Glidden and Elliott, heeling machine, dated February 10, 1891, No. 446,383;

Patent to Glidden, heel compressing and loading machine, dated August 1, 1893, No. 502,667.

[*Group of patents, relating to heel nailing machines, etc., as above enumerated, introduced in evidence, in one binder, and marked "Plaintiff's Exhibit 224".*]

Mr. WEBSTER. I offer copy of assignment from the Goodyear Shoe Machinery Company, of Connecticut, to the Goodyear Shoe Machinery Company, of Maine, dated March 9, 1893, recorded May 27, 1893, in Liber S. 48, page 122, of transfer of patents in the United States Patent Office. I ask that this assignment be marked for identification and I will procure a certified copy and introduce the same in evidence, provided opposing counsel insist upon a certified copy being produced.

Mr. CHOATE. What is that in support of, Mr. Webster?

Mr. WEBSTER. That one of the constituent companies was operating under the patents.

Mr. CHOATE. Please note our objection as immaterial, inadmissible and incompetent for the purpose suggested. We shall desire to ask that you get a properly certified copy.

[*Copy of assignment from Goodyear Shoe Machinery Company of Connecticut, to the Goodyear Shoe Machinery Company, of Maine, dated March 9, 1893, marked for identification "Plaintiff's Exhibit 225 for identification".*]

Mr. WEBSTER. The petitioner offers copies of all the patents referred to in the assignment.

Mr. CHOATE. We make the same objection as to the previous exhibit. We assume they are offered for the same purpose.

Mr. WEBSTER. They are offered for any purpose that they are admissible for, the same as the assignment was, to support the Government's case.

Mr. CHOATE. Note that we also object because they are not offered for any purpose within the scope of the order.

[*Copies of patents referred to in the assignment, in one binder, marked "Plaintiff's Exhibit 226".*]

Mr. WEBSTER. I will now ask Mr. Jones to take the stand.

DEPOSITION OF CHARLES H. JONES.

Direct Examination by ALLEN WEBSTER, Esq., *of Counsel for Complainant.*

Int. 1. Your name is Charles H. Jones and you are the same Charles H. Jones that has heretofore testified in this case?

Ans. Yes, sir.

Int. 2. You are, I believe, president of the Commonwealth Shoe & Leather Company?

Ans. Yes, sir.

Int. 3. Were you connected with the Commonwealth Shoe & Leather Company in January of 1899?

Ans. Yes, sir.

Int. 4. And for how long previous to that date were you connected with that company?

Ans. Since 1884,— the formation of the company.

Int. 5. Have you any personal knowledge as to whether the Goodyear Shoe Machinery Company were putting out machines early in 1899?

Ans. Yes, sir.

Int. 6. State what machines, to your knowledge, the Goodyear Shoe Machinery Company were putting out early in 1899.

Ans. They were putting out the welter and turn shoe machine, the rapid stitching machine — the rapid lockstitch stitching machine, it was called, I think; the rough rounding and channeling machine, outsole channelers, insole channelers, welt groovers and bevelers, lip turners, bobbin winders, and various other secondary machines, — auxiliary machines.

Mr. CHOATE. Please note our objection to that statement.

Int. 7. State, if you know, whether the Goodyear Shoe Machinery Company were putting out the machines referred to by you early in 1899, claiming the same to be protected by patents.

Mr. CHOATE. We object to the form of the question, and object to it also because it is leading and suggestive, and also because it is immaterial, irrelevant and inadmissible.

Ans. Yes, sir; they were.

Int. 8. State the foundation for your reply to the last question.

Mr. CHOATE. Note the same objections.

Ans. We were dealing with them continuously at that time. I find on our books during December, 1898, and January, 1899, numerous entries showing the transactions we were having with them at the time. We have had their leases before that time and since, and have been dealing with them continuously since 1884.

Mr. CHOATE. Please note our objection to the answer as not responsive to the question.

Int. 9. Have you, and can you produce, a lease agreement between the Goodyear Shoe Machinery Company and the Commonwealth Shoe & Leather Company dated approximately the date inquired about?

Ans. February, 1899. It is not a lease; it is a bill.

[*Produces a paper.*]

Int. 10. Kindly read the same that it may be entered on the record.

Ans. "Boston, February 14, 1899. Commonwealth Shoe & Leather Company, Marlboro, in account with the Goodyear & McKay Sewing Machine Company, 158 Summer Street. Subject to all the terms and conditions of any agreement or licenses between the said parties. For a lease and license of the following machinery:

One Good Lockstitch Machine, No. 223,
One Cop Winder, No. 181,
One Outsole Channeler No. 953,
One Three Foot Counter-shaft, all $350.
Terms, Cash, April 24, 1899. Shipped by Dart & Company's Express."

Mr. CHOATE. Please note our objection to the answer as not responsive to the question, as incompetent, inadmissible and immaterial.

[*Paper dated February 14, 1899, marked "Plaintiff's Exhibit 227".*]

Mr. CHOATE. And I ask to have noted on the record that the exhibit produced by the witness is not a bill of the Goodyear Shoe Machinery Company but purports to be a bill of the Goodyear & McKay Sewing Machine Company.

Int. 11. Mr. Jones, kindly state whether the bill you have produced and read into the record is the bill of the Goodyear Shoe Machinery Company?

Mr. CHOATE. Please note our objection to the question as seeking to contradict a written document by oral evidence; as incompetent, immaterial and inadmissible.

Ans. That is a bill from the same company that furnished us all our Goodyear machinery. I do not know the title of the company or when it was changed, if it has been changed. It was the company that we procured all our machinery from.

Mr. CHOATE. Note an objection to the answer as not responsive to the question.

Int. 12. Have you in your possession, and can you produce, a lease agreement between the Goodyear Shoe Machinery Company and the Commonwealth Shoe & Leather Company?

Mr. CHOATE. Do you fix any time?

Mr. WEBSTER. I will ask him the time when he produces it.

Ans. I have no leases with me. I have —

Mr. CHOATE. That is all you are asked.

The WITNESS. I beg your pardon. I have a lease; yes, sir.

Int. 13. Kindly give the date.

Ans. The first day of February, 1893. I have others. The first of February, 1893; the third day of January, 1895; the first day of March, 1892. I think those are all the leases I have here. I would not be sure. Here is one more: the fifth day of April, 1898; the eighth day of January, 1896; the twenty-third day of March, 1898; the eighteenth day of May, 1899; the twenty-first day of January, 1898.

Int. 14. Kindly produce the lease agreements called for dated April, 1898, and May 18, 1899.

Ans. [*Witness produces papers.*] Here is March, 1898. I do not know that you want that also.

Mr. WEBSTER. Do you admit the execution?

Mr. CHOATE. For the purposes of this case, waiving any other rights, we will admit the execution.

Mr. WEBSTER. The lease agreement referred to by the witness, dated April 5, 1898, is offered in evidence.

[*Agreement dated April 5, 1898, introduced in evidence and marked "Plaintiff's Exhibit 228".*]

Mr. CHOATE. Please note our objection to the exhibit as not containing any allegation in the scope of the order or included in the bill, and as incompetent, inadmissible and immaterial.

Mr. WEBSTER. Counsel for the Government respectfully calls attention to the recital in the leases of the patents.

The lease agreement produced by the witness, dated May 18, 1899, is offered in evidence.

[*Agreement dated May 18, 1899, introduced in evidence and marked "Plaintiff's Exhibit 229".*]

Mr. CHOATE. We ask that the same objection be noted as to the previous exhibit.

Mr. WEBSTER. Counsel for the petitioner calls particular attention to the recital in the lease agreements, reading as follows: —

"Whereas the lessor is the owner of or licensed under the several Letters Patent of the United States recited in the schedule following, namely, Schedule of Patents No. 240,307, dated April 19, 1881: —

No. 249,279, dated November 8, 1881;
No. 253,156, dated January 31, 1882."

Mr. CHOATE. Why not have that copied in without reading it?

Mr. WEBSTER. That is agreeable to me.

Mr. CHOATE. Or simply state that you call attention to the list of patents?

Mr. WEBSTER. I do not call attention to all of them. I call attention to the particular ones down to and including No. 488,481, dated December 27, 1892.

Those are the leases of January instead of April.

The WITNESS. Here is the April 5th one.

Mr. CHOATE. The patents you call attention to are the ones that expired before 1899?

Mr. WEBSTER. They include patents dated December 19, 1893, No. 511,263.

[*Lease dated May 18, 1899, introduced in evidence and marked "Plaintiff's Exhibit 229".*]

Int. 15. Kindly state whether you have knowledge as to whether the Consolidated & McKay Lasting Machine Company were putting out machines on or about the early part of 1899.

Ans. Yes, sir; they were.

Int. 16. State what machines the Consolidated & McKay Lasting Machine Company were putting out at the time referred to by you.

Ans. The ones on which I have knowledge are the Chase lasting machine and the Consolidated hand-method lasting machine.

Int. 17. State, if you know, whether the Consolidated & McKay Lasting Machine Company were putting out those machines at that time under claims of protection under patent.

Ans. Yes, sir; they were.

Mr. CHOATE. Please note our objection to the question, the same as that which was noted to the same question when previously put as to Goodyear machines.

Int. 18. State your reason for the statement that they were putting out machines under claim that the same were patented.

Ans. They tendered us leases for signature containing the list of the patents which they claimed covered these machines.

Int. 19. Have you any written memoranda dated on or about January, 1899, containing a recital of a list of patents claimed by that company?

Ans. I have a lease agreement dated January 23, 1900, with such a list.

Int. 20. Kindly produce the same for examination. [*Witness produces paper.*] I call your attention to the fact that the paper produced by you does not seem to be executed.

Ans. No, sir; he did not sign it. I have one dated the 24th of March, 1900, that is signed, a duplicate of that.

Int. 21. Kindly produce it. [*Witness produces paper.*]

Mr. WEBSTER. Do you admit the execution, Mr. Choate?

Mr. CHOATE. Do you offer this for any other purpose except to show that the Consolidated & McKay Lasting Machine Company

was doing business on the date of this paper under a claim of patents on these machines?

Mr. WEBSTER. And before that, of course. At that date and before.

Mr. CHOATE. That is the purpose of it? Limited to that purpose, we will admit the execution of the paper.

Mr. WEBSTER. The petitioner offers in evidence the paper produced by the witness, license and rental lease from the Consolidated & McKay Lasting Machine Company to the Commonwealth Shoe & Leather Company.

[*License and rental lease, dated March 24, 1900, from Consolidated & McKay Lasting Machine Company to Commonwealth Shoe & Leather Company introduced in evidence, and marked "Plaintiff's Exhibit 230".*]

Mr. WEBSTER. I call attention to the following recital: —

"This license and rental lease agreement, made in duplicate the 24th day of March A. D. 1900, by and between the Consolidated & McKay Lasting Machine Company, a corporation incorporated under the laws of the State of Maine, Licensor and party of the first part, and Commonwealth Shoe and Leather Co. of Skowhegan, Maine, Licensee and party of the second part, Witnesseth:

Whereas, the Licensor is now the owner of the following Letters Patent of the United States relating to Lasting Machines or auxiliary machines for lasting to wit:

No. 274,207, dated March 20, 1883,
No. 281,306, dated July 17, 1883,
No. 284,906, dated Sept. 11, 1883,
No. 292,575, dated Jan. 29, 1884,
No. 312,335, dated Feb. 17, 1885,
No. 415,726, dated Nov. 26, 1889,
No. 421,954, dated Feb. 25, 1890,
No. 423,920, dated March 25, 1890,
No. 423,921, dated March 25, 1890,
No. 423,922, dated March 25, 1890,
No. 423,937, dated March 25, 1890,
No. 441,482, dated Nov. 25, 1890,
No. 459,899, dated Sept. 22, 1891,
No. 482,349, dated Sept. 13, 1892,
No. 500,141, dated June 27, 1893,
No. 510,972, dated Dec. 19, 1893,
No. 510,973, dated Dec. 19, 1893,

No. 510,974, dated Dec. 19, 1893,
No. 510,975, dated Dec. 19, 1893,
No. 510,976, dated Dec. 19, 1893,
No. 510,977, dated Dec. 19, 1893,
No. 510,978, dated Dec. 19, 1893, . . ."

Mr. CHOATE. Please note our objection to the introduction of this exhibit as not in support of any allegation within the scope of the order or in the bill; and that it is incompetent, inadmissible and immaterial.

Int. 22. Kindly state whether you have knowledge as to whether the McKay Shoe Machinery Company was putting out machines under claim of patent protection early in 1899, or at about that time.

Mr. CHOATE. Please note our objection to the question, the same as was noted to the previous similar question as to the Goodyear machines.

Ans. Yes, sir; they were.

Int. 23. State what machines were being so put out by the McKay Shoe Machinery Company at that time.

Ans. Heeling machines and heel compressing machines.

Int. 24. Have you in your possession and can you produce any written memoranda, signed by that company, indicating under what patents it claimed protection?

Ans. The leases we have read from the McKay & Bigelow Heeling Machine Association, but our account, the money we paid, was to the McKay Shoe Machinery Company.

Mr. CHOATE. Please note our objection to the answer as not responsive to the question.

Int. 25. Have you refreshed your recollection by reference to your books to ascertain what dealings you had with reference to machines received by your company from the McKay Shoe Machinery Company at or about the date referred to?

Ans. Yes, sir.

Int. 26. State the facts in reference to the matter inquired about.

Mr. CHOATE. Please note our objection to the question, which has no reference to any intelligible previous question calling for an answer.

Ans. I have a lease and license, No. 1731, from the McKay-Bigelow Heeling Machine Association, dated December 17, 1897, for American lightning nailing machines, twelve of them, and for two Fisher compressing machines. [*Witness produces paper.*]

Mr. CHOATE. Please note our objection to the answer as not responsive to the question, and not in support of any allegation within the scope of the order or the bill.

Int. 27. State whether, within your knowledge, the McKay-Bigelow Heeling Machine Association, or it, associated with the McKay Shoe Machinery Company, continued up to early in 1899 putting out machines of the type referred to in the paper produced by you.

Mr. CHOATE. Please note our objection to the question as incompetent, inadmissible, irrelevant and not within the scope of the order.

Ans. It did so continue, sir.

Mr. CHOATE. Please note our objection to the answer as not competent evidence of the fact.

[*Lease and license No. 1731, from the McKay-Bigelow Heeling Machine Association, lessors, dated December 17, 1897, to the Commonwealth Shoe & Leather Company, lessee, introduced in evidence and marked "Plaintiff's Exhibit 231".*]

Mr. WEBSTER. Mr. Choate, will you admit the execution, as you did before?

Mr. CHOATE. We will admit the execution for the purpose of this case, but object to the introduction of the exhibit as not proving any fact within the scope of the order and as incompetent, immaterial and inadmissible.

Mr. WEBSTER. Counsel for petitioner calls attention to the following recital in the lease and license No. 1731: —

"Whereas, The Lessors are engaged in the manufacture of shoe machinery, and devices to be used in connection therewith, and particularly machinery and devices useful in the manufacture of the heel portions of boots and shoes; and

Whereas, The Lessors, at great expense, have endeavored, and are constantly endeavoring to improve and render more useful, the machinery and devices manufactured by them, and are the owners

of the following Letters Patent of the United States for improvements and inventions relating to machinery and devices for the manufacture of shoes, viz. : —

James W. Carver, 401,131, April 9, 1889.
Benjamin & Simmons, 503,895, Aug. 22, 1893. . . ."

Int. 28. Kindly state whether you have knowledge as to whether the Eppler Welt Machine Company was putting out machines early in 1899.

Ans. Yes, sir; it was.

Int. 29. Kindly state what machines, to your knowledge, the Eppler Welt Machine Company were putting out at that time.

Ans. Machines for sewing welt and machines for stitching the outer soles.

Int. 30. Have you knowledge or memorandum tending to show whether the Eppler Welt Machine Company were at that time putting out machines under claims of patent protection?

Ans. I have no memoranda. I have knowledge, but no memoranda.

Int. 31. You may state what you have knowledge of.

Ans. I examined the machinery, and its agent referred to patents which did not conflict with patents of the Goodyear Company and which effectively protected his machine.

Mr. CHOATE. Please note our objection to the answer as not responsive to the question, as stating hearsay, and as incompetent, inadmissible, irrelevant and immaterial.

Int. 32. State whether you have knowledge as to whether the Davey Pegging Machine Company were putting out machines early in 1899 under the claim of patent protection.

Ans. They were. I cannot fix the date exactly. It was prior to 1899, but I cannot state exactly the date.

Int. 33. State what machines were being put out by the Davey Pegging Machine Company on or about the early part of 1899.

Ans. A machine for pegging on a horn. We have only our book records of transactions with them. Our ledger shows the charges and the payments; we had no lease. It was a purchased machine.

Int. 34. State whether or not the Commonwealth Shoe & Leather Company purchased any machine or machines of the Davey Pegging Machine Company; and, if so, what machines, and when the same were purchased.

Ans. The Commonwealth Company purchased a pegging machine, for pegging on a horn, of the Davey Pegging Machine Company, prior to January, 1899. I cannot tell exactly the date. I have no record.

Int. 35. State whether that machine is in use at the present time.

Ans. It is.

Int. 36. Now, referring particularly to welting machines procured as stated by you of the Goodyear Shoe Machinery Company, kindly state as nearly as you are able when the first welting machine was procured by you or your company from that company.

Ans. I think in the year 1884.

Int. 37. State whether that particular machine is in use today.

Ans. I think not, sir. I do not find any lease of it here, and I don't think it is.

Int. 38. State for how long a time any one particular welting machine procured by the Commonwealth Shoe & Leather Company from the Goodyear Shoe Machinery Company has been, to your knowledge, in operation.

Mr. CHOATE. Please note our objection to the question as not within the scope of the order, as incompetent, inadmissible, irrelevant and immaterial.

Ans. I find one here dated May, 1896. There are some older than that, I know. I am sure that we have had some of the machines in use nineteen years.

Mr. CHOATE. Please note my objection to the answer as not responsive to the question, not in support of any allegation within the scope of the order; inadmissible, irrelevant, immaterial and incompetent.

Int. 39. Kindly state whether you caused any of the machines in your factory at Whitman to be photographed recently.

Ans. I did, sir.

Int. 40. And what machines?

Ans. The welt machine, the rough-rounding machine, the channeling machine and leveler.

Int. 41. When were these photographs made?

Ans. The first part of th' week.

Int. 42. Will you kindly produce the photographs and state what they refer to?

Ans. Photograph of our welt machine, No. 228. That I found the lease for a moment ago. That is dated May 28, 1896.

Mr. WEBSTER. I offer this, being a photograph of welting machine referred to in transfer agreement dated May 21, 1896.

[*Photograph of welting machine introduced in evidence and marked "Plaintiff's Exhibit 232".*]

Int. 43. Kindly state whether the welting machine a photograph of which has just been produced by you had any markings upon it; and, if so, what they were.

Ans. It had two name plates: one of them "No. blank, welt and turn shoe machine, patented, the property of the Goodyear Shoe Machinery Company, Lessor, Boston, Mass."; the other name

plate read: "The property of the United Shoe Machinery Company, Lessor, Goodyear Department, Goodyear welt and turn shoe machine, No. 228."

Int. 44. Kindly produce the next photograph, and state what it has reference to.

Ans. The next photograph is a Universal rough-rounding and channeling machine, No. 31.

[*Photograph of Universal rough-rounding and channeling machine introduced in evidence and marked "Plaintiff's Exhibit 233"*]

The WITNESS. That is included in lease of January 8, 1896.

Int. 45. Kindly state whether the Universal rough rounder of which Plaintiff's Exhibit 233 is a photograph is in use at the present time?

Ans. It is.

Int. 46. Kindly produce the next photograph referred to by you.

Ans. The next photograph is automatic leveler, No. 35.

[*Photograph of automatic leveler introduced in evidence and marked "Plaintiff's Exhibit 234".*]

Int. 47. Kindly produce the next photograph you have made reference to.

Ans. This is of an insole channeling machine, No. 2072.

Int. 48. Procured when and of whom?

Ans. Procured of the Goodyear Shoe Machinery Company prior to January, 1899.

Int. 49. Give the date, if you are able, and state whether it was procured under lease or otherwise.

Ans. I should be able if I had time enough. I may not have the lease. I did not know that you wanted the date today.

Int. 50. Kindly look it up so that you may testify tomorrow.

Ans. I will, sir.

[*Photograph of insole channeling machine No. 2072 introduced in evidence and marked "Plaintiff's Exhibit 235".*]

Mr. WEBSTER. I suggest that we adjourn and get those dates and get those leases.

Mr. CHOATE. Can't you use up the rest of the time?

Mr. WEBSTER. I prefer, saving my rights, to allow you to pro-

ceed with your cross-examination. As at present advised, I do not think of anything further to ask this witness.

Mr. CHOATE. That is, you have finished your examination?

Mr. WEBSTER. As at present advised. I may think of something further between now and tomorrow morning that I shall want to ask. I am quite content you should use up the time in cross-examining if you desire.

Cross Examination by CHARLES F. CHOATE, Esq., *of Counsel for Defendants.*

Cross-Int. 51. Mr. Jones, who selected those machines to be photographed?

Ans. I did.

Cross-Int. 52. At whose request?

Ans. At the request of the Government.

Cross-Int. 53. What was the request?

Ans. That I photograph certain machines. I don't know as I can tell you exactly, but my recollection is that I was to cause photographs to be taken of certain machines which were bought prior to the formation of the United Machine Company.

Cross-Int. 54. You do not mean bought?

Ans. I mean leased, procured.

Cross-Int. 55. Any machines that you had acquired, or machines that you had acquired at a certain time?

Ans. Machines that we had acquired prior to the formation of the United Company.

Cross-Int. 56. Do you mean at any time prior?

Ans. As I remember it. I do not remember that there was any specification. I do not know that there was any specification as to time.

Cross-Int. 57. That is, to photograph any machines that you had acquired prior to February, 1899?

Ans. Of these different companies; yes, sir.

Cross-Int. 58. Did you have anything to do with the procuring of the Davey pegging machine?

Ans. No, sir.

Cross-Int. 59. Which you say your company had?

Ans. No, sir.

Cross-Int. 60. You have no idea when it was acquired?

Ans. I have as much idea as any of our people. We cannot, any of us, remember just the time; we talked it over. We cannot remember. We have no lease or anything that gives us the date. It was prior to 1899.

Cross-Int. 61. You speak of it as being purchased. Have you any knowledge whatever of the transaction by which it came into your possession?

Ans. Our treasurer tells us at the time he purchased it —

Cross-Int. 62. No.

Ans. I did not do it myself, if you mean that.

Cross-Int. 63. I do not want your statement of what somebody else told you.

Mr. CHOATE. I ask that that be stricken out.

Cross-Int. 64. Have you any knowledge of the transaction by which it came into your possession?

Ans. No personal — I did not do it myself. I have the same knowledge of it as I should have if our treasurer buys leather —

Cross-Int. 65. Have you made any examination of your books to ascertain the date?

Ans. I have.

Cross-Int. 66. Did you find anything to show when it was acquired?

Ans. I have not as yet. I found a ledger with the date of January, 1899, where was an entry of supplies purchased. I did not go back of that. I do not know whether I can find an earlier ledger or not.

Cross-Int. 67. You expect to be here tomorrow? I wish you would look up your books as far back as you have occasion to, to ascertain if you can find anything with reference to any purchase of that machine.

Ans. It would be quite impossible for me to find anything by that time, because for that remote time it is rather difficult, and the papers are not easily accessible.

Cross-Int. 68. You mean the transaction may have been any time between 1884 and 1899?

Ans. No; I do not mean that.

Cross-Int. 69. Between what dates?

Ans. For a long time after 1884 I was in the factory constantly. We did not use the Davey pegger.

Cross-Int. 70. Between what times approximately?

Ans. I should say my best judgment would be it would be between 1895 and 1899.

Cross-Int. 71. Please examine your books between 1895 and 1899 and see if you find any record of any purchase of the Davey pegging machine.

Ans. I will. If I can find the books I will examine them, certainly.

Cross-Int. 72. Was there any name on the machine?

Ans. On the Davey pegger?

Cross-Int. 73. Yes.

Ans. I have not examined it with that in mind.

Cross-Int. 74. Will you examine it and ascertain if there is any?

Ans. Yes, sir.

Mr. CHOATE. That is all.

[*Adjourned to 10 A. M., Friday, August 15, 1913.*]

BOSTON, MASS., August 15, 1913.

Direct Examination resumed by Mr. WEBSTER.

Int. 75. Did I ask you about a certain date?

Ans. Yes, about a date on a channeling machine.

Int. 76. Do you recollect where that is?

Ans. The date is in a lease which Mr. Keliher has, and I have not been able to get hold of it.

Int. 77. Then you can't give it this morning?

Ans. No.

Int. 78. Is there anything else?

Ans. Mr. Choate called for a memorandum in relation to the Davey pegger. I have made further examination and will be glad to state that, if this is the time.

Cross Examination resumed by Mr. CHOATE.

Cross-Int. 79. Have you obtained any information as to the time when your company acquired the Davey pegger?

Ans. I examined the ledger previous to the one I referred to in my testimony, and I find a credit to John F. Davey on July 3, 1895, machinery $300, and that item was paid for on August 29, 1895, and I believe that that was the pegging machine in question. But I have no bill for it and only the ledger entry, so I cannot say any further. I have written to a man who was cognizant of the matter, who was employed by us, but I have no answer of course, and I do not know whether I shall be able to get any further information or not.

Cross-Int. 80. So your best information is, from that investigation, that in July, 1895, the Commonwealth Shoe Company bought a pegger of John F. Davey?

Ans. Yes, sir.

Cross-Int. 81. And that is the one which you testified about yesterday?

Ans. Yes, sir.

Cross-Int. 82. So you would want to correct your statement, would you not, that it was bought of the Davey Pegging Machine Company? If it was bought of anybody, it was bought of John F. Davey, to whom the money was paid, wasn't it?

Ans. Exactly. At the time referred to in my statement yesterday, January, 1899, the account was in the name of the Davey Pegging Machine Company. On this previous ledger I find the name of John F. Davey crossed out, and the Davey Pegging Machine Company inserted in its place, or following it.

Cross-Int. 83. It would seem to indicate that the Davey Pegging Machine Company was not in existence at the time you got the machine?

Ans. It would seem to indicate that John F. Davey did the business, and was succeeded by the Davey Pegging Machine Company.

Cross-Int. 84. And that one transaction is all the knowledge

that you have about who put out or marketed the Davey Pegging Machine prior to 1899?

Ans. Oh, no. We were constant —

Cross-Int. 85. Pardon me. Have you personal knowledge of acquiring any other pegging machines by your company than the one of which you testified?

Ans. No, sir.

Cross-Int. 86. Did you look up any other matter yesterday for me?

Ans. I don't think so. I don't recollect anything else.

Mr. CHOATE. That is all.

Direct Examination resumed by Mr. WEBSTER.

Int. 87. You were asked in cross-examination yesterday as to your knowledge about the putting out of these pegging machines. Kindly state what knowledge you had about the Davey Pegging Machine Company putting out pegging machines in 1899 or about that time.

Mr. CHOATE. Please note my objection to the question as being a subject which was inquired about on direct examination and not opened again on redirect examination.

Ans. The business done by John F. Davey was continued by the Davey Pegging Machine Company and we were in constant dealing with them, and the Davey Pegging Machine Company offered us improvements on our machines some time prior to 1899, — shortly prior to 1899, I think.

Mr. WEBSTER. I inadvertently omitted to have the catalogue which is put in as Plaintiff's Exhibit No. 220 identified, and I pray the indulgence of the court and counsel for that purpose.

Int. 88. I will ask you to kindly examine the book I now hand you [*Exhibit 220*], the same being marked "Plaintiff's Exhibit 220", and ask you to state what it is.

Mr. CHOATE. Please note our objection to the question, as it does not appear that Mr. Jones ever had any connection with the company which it is claimed issued the catalogue, or that he had any

personal knowledge of the issuance of the catalogue whatever, or that he has ever seen the paper before.

Ans. This is like a catalogue that we had which we received from this company —

Mr. CHOATE. Which company?

The WITNESS. The Goodyear Shoe Machinery Company.

Ans. [*resumed:*] —and used in our business for several years.

Mr. CHOATE. Please note our objection to the answer as not being responsive to the question, and request that it be stricken out.

Mr. WEBSTER. That is all I think of now, Mr. Choate, to inquire of this witness at the present time.

Cross Examination resumed by Mr. CHOATE.

Cross-Int. 89. Mr. Jones, do you know whether the pegging machines, if any, which were put out by the Davey Pegging Machine Company prior to 1899 were in all respects similar to the machine which you have testified your company obtained from John F. Davey?

Ans. I don't think that they were in all respects similar. I think improvements were added to the machine brought out by the Davey Pegging Machine Company.

Mr. CHOATE. That's all.

Mr. WEBSTER. As tending to show that the Davey Pegging Machine Company were putting out machines claimed to be built under patents, the petitioner offers in evidence lease and license No. 186, between the Davey Pegging Machine Company and Selz, Schwab & Company, dated March 10, 1899, and calls particular attention to the recital therein, as follows: —

"Whereas the lessor is the owner of the following described Letters Patent of the United States, namely, No. 414,501, Nov. 5, 1889, to John F. Davey, No. 504,311, August 29, 1893, to John F. Davey."

[*Lease and license No. 186, between Davey Pegging Machine Company and Selz, Schwab & Company, dated March 10, 1899, offered in evidence and marked "Plaintiff's Exhibit 236".*]

Mr. CHOATE. Please note the defendants' objection to the intro-

duction of that paper as not tending to support any allegation which is within the scope of the order, or within the bill, and as not tending to sustain the proposition for which it is offered.

Mr. WEBSTER. Do you admit the execution?

Mr. CHOATE. For the purposes of this case we will admit of the paper's execution.

Mr. WEBSTER. In support of the petitioner's allegation that the Consolidated & McKay Lasting Machine Company were putting out machines claimed to be protected by Letters Patent early in 1899, petitioner offers license and rental lease No. 58 G, dated January 28, 1899, between the Consolidated & McKay Lasting Machine Company and R. H. Long Shoe Manufacturing Company, and calls particular attention to the patents therein enumerated as follows:—

"274,207, dated March 20, 1883,
281,306, dated July 17, 1883,
284,906, dated Sept. 11, 1883,
292,575, dated Jan. 29, 1884,
312,335, dated Feb. 17, 1885,
415,726, dated Nov. 26, 1889,
421,954, dated Feb. 25, 1890,
423,920, dated March 25, 1890,
423,921, dated March 25, 1890,
423,922, dated March 25, 1890,
423,937, dated March 25, 1890,
441,482, dated Nov. 25, 1890,
459,899, dated Sept. 22, 1891,
482,349, dated Sept. 13, 1892,
500,141, dated June 27, 1893,
510,972, dated Dec. 19, 1893,
510,973, dated Dec. 19, 1893,
510,974, dated Dec. 19, 1893,
510,975, dated Dec. 19, 1893,
510,976, dated Dec. 19, 1893,
510,977, dated Dec. 19, 1893,
510,978, dated Dec. 19, 1893,
518,933, dated April 24, 1894,
523,939, dated July 31, 1894,"—

copies of which patents are to be produced and introduced herein.

[*License and rental lease No. 58 G, Consolidated & McKay Last-*

ing Machine Company to R. H. Long Shoe Manufacturing Company, Springfield, Massachusetts, dated January 28, 1899, introduced in evidence and marked "Plaintiff's Exhibit 237".]

Mr. CHOATE. We admit the execution for the purposes of this case.

Mr. WEBSTER. In support of the petitioner's allegation that the Consolidated & McKay Lasting Machine Company put out machines early in 1899 claimed to be protected by Letters Patent, the petitioner offers in evidence the license and rental lease between the Consolidated & McKay Lasting Machine Company and Selz, Schwab & Company, dated December 17, 1898, and calls particular attention to the patents therein recited, of which patents copies will hereafter be produced and put in evidence, as follows: —

"319,784, dated June 9, 1885;
337,662, dated March 9, 1886;
337,924, dated March 16, 1886;
337,925, dated March 16, 1886;
338,930, dated March 30, 1886;
340,860, dated April 27, 1886;
356,619, dated January 25, 1887;
356,620, dated January 25, 1887;
363,283, dated May 17, 1887;
364,088, dated May 31, 1887;
376,368, dated January 10, 1888;
391,688, dated October 23, 1888;
477,788, dated June 28, 1892;
477,789, dated June 28, 1892;
478,501, dated July 5, 1892;
483,375, dated September 27, 1892."

In connection with this license and rental lease the petitioner offers memorandum attached thereto, dated March 11, 1899, reading as follows: "Boston, Mass., March 11th, 1899."

Mr. CHOATE. We do not object to that, but we think it would be convenient as you refer to those papers if you should state what they are leases of; don't you think so?

Mr. WEBSTER. So many have gone in without it that I do not suppose it would be of any advantage now. I will read the memorandum.

"Boston, Mass., March 11th 1899.

To Messrs. Selz, Schwab & Co. Chicago, Ill.

Gentlemen: — Enclosed please find your copies of the lease with signatures completed. Yours very truly,

Chase Dept.

CONSOLIDATED & McKAY LASTING MCH. Co.

R."

I also call attention to a memorandum attached dated Boston, Mass., March 17, 1899, reading as follows: —

"To Messrs. Selz, Schwab & Co., Chicago, Ill.

Gentlemen: — Enclosed please find your copy of the lease with signatures completed. Yours very truly,

Chase Dept.

CONSOLIDATED & McKAY LASTING MCH. Co."

[*License and rental lease, dated December 17, 1896, between Consolidated & McKay Lasting Machine Company and Selz, Schwab & Company, with two letters thereto attached as above stated, introduced in evidence and marked "Plaintiff's Exhibit 238".*]

Mr. WEBSTER. I very much regret the illness of Mr. Chapman. Mr. Gregg is to see Mr. Chapman in New York today and communicate with me at once, and he hopes he will be able to testify by the middle or latter part of next week. Under the circumstances, I do not see how I can proceed further until the middle or latter part of next week.

Mr. CHOATE. You will advise us as soon as you can when you can go ahead, will you?

Mr. WEBSTER. Yes; just as soon as I find out what I can do, I will notify you promptly and give you all the notice in advance possible.

Mr. CHOATE. You will not forget, will you, that we want to be away between the 9th of September and the 1st of October?

Mr. WEBSTER. Now, Mr. Keliher spoke to me about that, and I told him to say to you that it was impossible for me personally to agree to any extension of that kind; that personally I was perfectly agreeable. I was compelled to refer the matter to Mr. Gregg. I will confer with Mr. Gregg at the first opportunity. If it is within my power, I will be only too glad to accommodate you.

Mr. CHOATE. You perhaps notice that we have acquiesced in all your postponements?

Mr. WEBSTER. Yes. You have been fair about it.

[*Signature waived.*]

Attest: CHARLES K. DARLING, *Special Examiner.*

[*Adjourned subject to notice from counsel for the Government.*]

BOSTON, MASS., August 25, 1913.

Mr. WEBSTER. The petitioner now offers in evidence a certified copy of the assignment from the Goodyear Shoe Machinery Company, of Connecticut, to the Goodyear Shoe Machinery Company, of Maine, to take the place of the uncertified copy put in for identification as Plaintiff's Exhibit 225, and requests leave to withdraw the copy put in for identification and substitute the certified copy, and requests that the same be marked "Plaintiff's Exhibit 225".

Mr. CHOATE. There is no objection to that.

[*Certified copy of assignment from Goodyear Shoe Machinery Company, of Connecticut, to the Goodyear Shoe Machinery Company, of Maine, dated March 9, 1893, introduced in evidence and marked "Plaintiff's Exhibit 225".*]

Mr. WEBSTER. The petitioner offers in evidence group of twenty-four patents to which particular attention was called at the time of the introduction of Plaintiff's Exhibit 237, the same being patents to which attention was called in lease between the Consolidated & McKay Lasting Machine Company and the R. H. Long Shoe Manufacturing Company, said lease being dated January 28, 1899, said copies of patents comprising the following: —

Patent to J. E. Matzeliger, lasting machine, No. 274,207, dated March 20, 1883;

Patent to J. R. Scott, lasting machine for boots and shoes, No. 281,306, dated July 17, 1883;

Patent to J. R. Scott, machine for lasting boots and shoes, No. 284,906, dated September 11, 1883;

Patent to A. W. Pearson, lasting machine, No. 292,575, dated January 29, 1884;

Patent to C. Dancel, machine for lasting boots and shoes, No. 312,335, dated February 17, 1885;

Patent to J. E. Matzeliger, mechanism for distributing tacks, nails, etc., No. 415,726, dated November 26, 1889;

Patent to J. E. Matzeliger, nailing machine, No. 421,954, February 25, 1890;

Patent to Gooding et al., nail and tack driving machine, No. 423,920, dated March 25, 1890;

Patent to Gooding et al., pegging machine, No. 423,921, dated March 25, 1890;

Patent to Gooding et al., lasting machine, No. 423,922, dated March 25, 1890;

Patent to J. E. Matzeliger, tack separating and distributing mechanism, No. 423,937, March 25, 1890;

Patent to Gooding et al., nail driving machine, 441,482, November 25, 1890;

Patent to Matzeliger, lasting machine, 459,899, September 22, 1891; * *

Patent to Frechette, last machine, 482,349, September 13, 1892;

Ladd, lasting machine, 500,141, June 27, 1893;

Ladd, starting and stopping mechanism for lasting machines, 510,972, December 19, 1893;

Ladd, lasting machine, 510,973, December 19, 1893;

Ladd, lasting machine, 510,974, December 19, 1893;

Ladd, lasting machine, 510,975, December 19, 1893;

Ladd, tacking machine, 510,976, December 19, 1893;

Ladd, lasting machine, 510,977, December 19, 1893;

Ladd, tack separating and feeding mechanism, 510,978, December 19, 1893;

Wheeler, tack distributor, 518,933, April 24, 1894;

Ladd, lasting machine, 523,939, July 31, 1894.

Mr. CHOATE. Are those all the patents mentioned in the lease, or only part of them?

Mr. WEBSTER. Only part of them, I think.

[*Group of patents introduced in evidence and marked "Plaintiff's Exhibit 239".*]

Mr. WEBSTER. Petitioner offers in evidence lease and license, former number 1593, new number 1785, between James W. Brooks, principal trustee, and John Brooks, associated trustee for the McKay-Bigelow Heeling Machine Association, lessors, and Selz, Schwab & Company, lessee, dated March 21, 1898, and calls particular attention to the patents therein referred to, copies of which patents will be offered in evidence as soon as the same are procured.

Mr. CHOATE. This is only for the purpose of showing that the McKay Shoe Machinery Company was doing business under a claim of patents prior to 1899?

Mr. WEBSTER. Yes. And in connection therewith the petitioner offers letter dated November 2, 1898, reading as follows: —

"Office of the
McKAY SHOE MACHINERY COMPANY,
No. 76 Lincoln Street,
Heeling Department. Boston, November 2nd, 1898.
Mess. Selz, Schwab & Co., Chicago, Ill.,
Gentlemen: — Will you kindly number the lease sent you for the compressor #34 and Mayo rapid nailer #2555 at Joliet, which is now numbered #1593, to #1785, and greatly oblige?
Yours truly,
Dic. McKAY SHOE MACHINERY CO."

[*Lease and license No. 1785 from James W. Brooks, principal trustee, and John Brooks, associated trustee for the McKay-Bigelow Heeling Machine Association, lessors, to Selz, Schwab & Company, lessee, dated March 21, 1898, with letter of November 2, 1898, attached thereto marked "Plaintiff's Exhibit 240".*]

Mr. WEBSTER. Is the execution admitted?

Mr. CHOATE. Yes.

Mr. WEBSTER. Counsel for petitioner calls particular attention to the recital of the machines set forth in the lease just offered in evidence reading as follows: —

"McKay Pricking Machine,
McKay Heel Compressing and Loading Machine,
Fisher Compressing Machine,
Bresnahan Compressing Machine,
Heel Trimming and Randing Machine,

Heel Trimming and Randing (including Grinding) Machine,
No. 2 Automatic Heel Nailing and Trimming Machine,
Rapid Nailing Machine,
Union Heel Trimmer,
Spring Heel Trimmer,
American Lightning Nailing Machine,
American Compressing Machine,
Columbia Compressing Machine,
Automatic Heel Loading and Compressing Machine,
Improved National Nailing Machine,
Columbia Nailing Machine,
Automatic Spring-heel Nailing Machine,
Standard Automatic Nailing Machine,
Standard Automatic Nailing Machine, without Pricking Attachment,
Standard Automatic Loading or Compressing and Loading Women's Work Machine."

In support of petitioner's contention that the Goodyear Shoe Machinery was engaged in putting out machines early in 1899, and it being found difficult to procure any documents relating to that exact date, petitioner offers in evidence memoranda of the Goodyear Shoe Machinery Company dated November 29, 1897, and memoranda of the Goodyear Shoe Machinery Company dated March 27, 1900, in both of which memoranda the following machines are recited: —

"Goodyear Welt Shoe Machine, Chain Stitch,
Goodyear Turned Shoe Machine, Chain Stitch,
Goodyear Turned or Welt Shoe Machine, Lock Stitch,
Goodyear Outsole Stitcher, (Lock Stitch, "Rapid"),
Welt Channeller,
Outsole Channeller,
Turn Channeller,
Channel Lip Turner,
Universal Rounder and Channeller,
Sole Layer,
Hadaway Stitch Separating Machine,
Automatic Levelling Machine,
Welt Beater,
Bobbin Winder,
Welt Groover,
Welt Splitter,
Moulder,

Channel Opener,
Universal Shanking-Out Machine,
Inseam Trimmer."

Mr. CHOATE. We will admit the signature for the purpose of this case without waiving our objection to the competency of the papers for the purpose offered.

[*Proposal and acceptance dated November 29, 1897, and proposal and acceptance dated Whitman, Mass., March 27, 1900, introduced in evidence and marked "Plaintiff's Exhibit 241".*]

Mr. WEBSTER. Petitioner also, in support of its contention that the Goodyear Shoe Machinery Company was engaged in putting out machines early in 1899, offers memoranda of the Goodyear Shoe Machinery Company dated February 3, 1898, addressed to Messrs. L. C. Bliss & Co., Whitman, Mass., in which the following machines are recited: —

"Goodyear Turned or Welt Shoe Machine, Chain Stitch,
Goodyear Turned or Welt Shoe Machine, Lock Stitch,
Goodyear Outsole Stitcher, (Lock Stitch, 'Rapid'),
Welt Channeller,
Outsole Channeller,
Turn Channeller,
Channel Lip Turner,
Universal Rounder and Channeller,
Automatic Leveller,
Sole Laying Machine,
Welt Beater,
Shank Skiver,
Turn Trimmer,
Bobbin Winder,
Welt Groover,
Welt Splitter,
Moulder,
Channel Opener,
Universal Shanking-out Machine,
Stitch Separator."

Mr. CHOATE. We will admit the execution without waiving our objection to the competency of the papers.

[*Letter of Goodyear Shoe Machinery Company to L. C. Bliss & Co., dated February 3, 1898, introduced in evidence and marked "Plaintiff's Exhibit 242".*]

Mr. WEBSTER. Petitioner offers in evidence catalogue of McKay-Bigelow Heeling Machine Association bearing date on the front cover 1890, and bearing date on the inner cover, page 1, 1888.

Mr. CHOATE. Please note the defendants' objection to the exhibit as not properly identified, as not competent, as immaterial, irrelevant and inadmissible.

[*Catalogue of McKay-Bigelow Heeling Machine Association, 1888–1890, marked "Plaintiff's Exhibit 243".*]

Mr. WEBSTER. Petitioner offers in evidence catalogue of the Chase Lasting Machine Company dated 1886.

Mr. CHOATE. What is this offered for, Mr. Webster?

Mr. WEBSTER. It shows that certain machines were being put out, and we expect to connect it up later.

Mr. CHOATE. Note the defendants' objection to the exhibit as not tending to prove anything within the scope of the order or bill, as not properly identified, and as incompetent, immaterial, irrelevant and inadmissible.

[*Catalogue of the Chase Lasting Machine Company, dated 1886, marked "Plaintiff's Exhibit 244".*]

DEPOSITION OF CHARLES McC. CHAPMAN (*recalled*).

Direct Examination by ALLEN WEBSTER, Esq., *of Counsel for Complainant.*

Mr. CHOATE. Are you now calling Mr. Chapman again?

Mr. WEBSTER. In view of your objection, he will have to be called again.

Mr. CHOATE. I should like to have it noted on the record that we have understood Mr. Chapman's deposition has been closed except for anything that has been forgotten, and this does not appear to be any evidence that has been forgotten by the United States. We should therefore like to have our objection noted.

Mr. WEBSTER. Counsel for the United States states that, as heretofore stated by him, Mr. Chapman testified only with reference to particular machines and patents, and I now desire to put him on with reference to other machines and patents. For that purpose he is recalled.

Mr. CHOATE. We did not understand that counsel for the United States so stated, although we particularly inquired if his direct evidence had been closed, and should not have cross-examined him had we not been advised that it had been.

Int. 46. Kindly state whether since you have testified in this case you have examined the machine illustrated in photograph Plaintiff's Exhibit 232; and, if so, state where you examined the same.

Ans. I have examined the machine of the said exhibit, having found the same at the factory of the Commonwealth Shoe and Leather Company, Whitman, Massachusetts. In so examining the machine, I compared the machine with the illustration of the photograph Plaintiff's Exhibit No. 232, and also noted the number of the machine at the said factory to be 228.

Int. 46. State whether you have made comparison between the welter illustrated in Plaintiff's Exhibit Photograph No. 232 with the illustration of welt and turn machine found on page 13 of catalogue of parts of Goodyear Shoe Machinery Company, Plaintiff's Exhibit 220.

Ans. I have made such comparison.

Int. 48. State the likenesses and differences, if any, you found on making such comparison.

Ans. In comparing the machine of Plaintiff's Exhibit No. 232 with the welt and turn machine of the catalogue of Plaintiff's Exhibit 220, and the illustration of which machine found at page 13 of said catalgoue, I found the said machine and the machine of the cut of the catalogue to be substantially the same in point of structural features as illustrated in the catalogue. One difference noted by me was the lack in the machine of the catalogue at page 13 of the so-called LaChapelle tension release and stop mechanism. I, however, found that the said tension release parts are referred to in said catalogue of Plaintiff's Exhibit 220 on pages 225 and 226. I made comparison of the numbers of the said parts, as indicated in the catalogue, with the numbers on certain of the parts of the machine and found them to correspond. I particularly noted the numbers 1103, 1106 and 1108 on the corresponding parts of

the machine, and also found that other numbers in the list referred to parts descriptive of those found in the machine.

Int. 49. Have you examined, and do you understand, English patent No. 13,366 of 1888, to French and Meyer, a copy of which I now hand you?

Ans. I have examined this patent and believe I understand the same.

Mr. WEBSTER. English patent to French and Meyer 13,366 of 1888 put in evidence and marked "Plaintiff's Exhibit 245".

Int. 50. Have you made comparison between the drawings, specification and claims of the English patent Plaintiff's Exhibit No. 245 and the construction illustrated and described and claimed set forth in United States patent to French and Meyer No. 412,704, Plaintiff's Exhibit 214, and Briggs patent No. 461,793, Plaintiff's Exhibit 217? And if you have made such examination and comparison, kindly state what you found with reference to their likenesses and differences.

Mr. CHOATE. Please note the defendants' objection to Exhibit 245 and to the question now propounded, on the ground that it is not within the scope of the order, as incompetent, immaterial, irrelevant and inadmissible.

Ans. I have made a comparison of the British patent No. 13,366 of 1888 with the United States French *et al.* patent No. 412,704, Plaintiff's Exhibit 214, and the United States patent to Briggs 461,793, Plaintiff's Exhibit 217, both as to illustration, text or description and substance of subject-matter of the claims of the several patents. Referring to the British patent and the French *et al.* patent No. 412,704, I find that the first seven figures of the latter patent are substantially identical with the seven figures of the British patent, both as to views, position of parts and subject-matter illustrated, and practically as to reference characters and disposition of the same on the several figures of the drawings. In the United States patent there are several figures, 8 to 19 inclusive, which are not in the drawings of the British patent, but which relate entirely to details of the construction and apparently better illustration of parts. In point of descriptive matter, the

text of both the patents seems to be substantially the same, and in all material particulars the text of the one will read upon the drawings of the other. As to the claims, the first three claims of the British patent run to the structure shown in the United States patent, and the five claims of the United States patent run to the subject-matter illustrated in the British patent and described therein. There is a difference in phraseology in the claims of the respective patents, and in consequence a slight difference in scope of claims. In substance, however, the structure claimed is the same. Referring now to the Briggs patent 461,793, Plaintiff's Exhibit 217, I find that the method of this United States patent is substantially described and claimed in the British patent 13,366 of 1888, and that the subject-matter of the claim of said Briggs patent is illustrated in the British patent 13,366. In the British patent there are two claims, Nos. 4 and 5, which set up the method of making chain stitches shown, described and claimed in the Briggs patent. There is a difference in the phraseology and claim wording in the British claims 4 and 5, but the subject-matter of the British claims 4 and 5 is substantially that of the claim of the United States Briggs patent.

Mr. CHOATE. Please note that the defendants object to so much of the witness' answer as compares the United States patent to Briggs with the British patent as immaterial, irrelevant, incompetent and inadmissible.

Int. 51. State whether you have quite recently examined a machine known as the Chase laster, and whether as a result of such examination you understand the construction and operation of the same.

Ans. I have examined several Chase lasting machines, so called, one in South Framingham, Massachusetts, at the factory of the R. H. Long Machinery Company, and several at the factory of the Commonwealth Shoe and Leather Company, Whitman, Massachusetts, and believe that I understand the structure and mode of operation of the said machines.

Int. 52. State whether you have examined and understand United States patents to Chase, lasting machine No. 348,060, dated April

27, 1886; patent to Chase, machine for lasting boots or shoes, No. 364,088, dated May 31, 1887; patent to Chase, lasting machine, dated January 10, 1888, No. 376,368, and patent to Chase, tack driving mechanism, No. 483,375, dated September 27, 1892, copies of which I now hand you.

Ans. I have examined the several patents referred to and believe that I understand the same.

Int. 53. State whether you have made comparison between the machines illustrated and described in the patents referred to and the construction referred to in the claims of said patents with the machines which you say you examined.

Ans. I have.

Int. 54. State the likenesses and differences between the structures of the machines examined and the structures and operations of the machines shown in the patents referred to in the claims thereof.

Ans. Referring first to Chase patent 348,060, dated April 27, 1886, I made a careful comparison of the subject-matter of this patent with the machine at the Long factory in South Framingham, and found the subject-matter of the patent, in point of illustration, description and both the claims, to be embodied in said machine. Having studied the machine in connection with the said patents and becoming quite familiar with it, I also examined several machines at the Whitman factory and found them to contain the same subject-matter. The machine at the Long factory I assume is No. 300, or approximately that, owing to the fact of the parts of the machine having the series numbers 301, etc. There was no number on the face of this machine. The base of the machine, however, had the following marking: "The Property of the Chase Lasting Machine Company." In the factory at Whitman, however, the numbers of two of the machines are 529 and 801. I did not take the numbers of the other three. The base of these several machines, however, all had the same marking as the machine at South Framingham, viz.: "The Property of the Chase Lasting Machine Company."

Referring to the Chase patent No. 364,088, May 31, 1887, I

made a careful comparison of the subject-matter of this patent, as illustrated with the machine at the South Framingham factory, and found said machine to contain the subject-matter of the patent with the exception of a few details of construction, said details having reference to the gear drive, illustrated in Figure 1 of the said patent; in Figures 4, 5 and 6 the gearing shown in these several figures not being present in the said machine. This was also true of the several machines at the Whitman factory. Also, the particular means shown for adjusting the toe-clamp shown in Figure 2 is not embodied in the South Framingham machine in the matter of the screw and slot construction indicated by 4 and 5 in said Figure 2. In the machines at the said factory there was simply an adjusting screw bearing upon the opposite ends of the toe-clamp. In point of operation and function the structures, however, are the same. In Figure 7 of the Chase patent No. 364,088 is illustrated a pliable toe-clamp or clasp. In the machine at the South Framingham factory, my recollection is that the structure of this portion or part of the machine was slightly different in that instead of being a continuous link construction the machine has a solid central portion, to the opposite ends of which the links are connected. In substance, however, the structures of the patent and the machine are substantially identical. I carefully read the claims of this patent upon the said South Framingham machine and found that claims 1, 2, 3 and 4 and 9, 10 and 11 are fully and clearly embodied in said machine.

Referring to the Chase patent No. 376,368, dated January 10, 1888, I made the same careful comparison of the subject-matter thereof with the South Framingham machine and found the structure shown and described and claimed therein to be embodied in said machine, with the difference heretofore noted in connection with the previous patent running to the detail of the solid central portion of the clamp or clasp. I also compared the claims of this Letters Patent with the machine at South Framingham and found the substance of all four of the said claims fully embodied in the said machine.

Referring now to the Chase patent No. 483,375, dated Septem-

ber 27, 1892, which in subject-matter is for a tack-driving mechanism, I found the instrument described and shown in this patent suspended on the machine at the South Framingham factory, and similar instruments in use by the operatives in connection with the several machines at the Whitman factory. At the South Framingham factory I found the following marking on the instrument: "1150. The Property of the Chase Lasting Machine Company. Patd. October 14, 1884, January 25, 1887, September 27, 1892." I took this instrument all apart and carefully compared the same with the structure illustrated in the said patent 483,375 and found the subject-matter to be exactly the same. I also carefully read the claim of the patent on the instrument and found the structure thereof to be fully embodied in the instrument No. 1150.

Mr. WEBSTER. Copies of the four patents referred to by the witness put in evidence as one exhibit and marked "Plaintiff's Exhibit 246".

[*Copies of the following patents, patent to Chase, lasting machine, No. 348,060, dated April 27, 1886;*

Patent to Chase, machine for lasting boots or shoes, No. 364,088, dated May 31, 1887;

Patent to Chase, lasting machine, dated January 10, 1888, No. 376,368;

And patent to Chase, tack-driving mechanism, No. 483,375, dated September 27, 1892, introduced in evidence and marked "Plaintiff's Exhibit 246".]

Mr. CHOATE. I should like to have our objection noted to the exhibit as not supporting any claim included within the scope of the order or the bill; as incompetent, irrelevant, immaterial and inadmissible.

Int. 55. Kindly state whether you have recently examined a machine known as a Universal rounding and channeling machine of which Plaintiff's Exhibit (photograph) No. 233 is a picture.

Ans. I have, one at the South Framingham factory and one at the Whitman factory. The machine at the South Framingham factory has the following marking on the stand-plate: "The Property of the United Shoe Machinery Co., Lessors, Goodyear Depart-

ment, Goodyear Universal Rounding and Channelling Machine No. 408." The numbers on the parts of the head of the machine are all 2100 and upwards. The number of the machine at the Whitman factory which I examined is 31, and is that which is illustrated in the photograph Plaintiff's Exhibit No. 233.

Int. 56. Kindly examine copy of patent to Briggs, rough rounding and channeling machine, dated November 24, 1891, No. 463,982, issued to the Goodyear Shoe Machinery Company as assignor, and state whether you understand the same.

Ans. I have examined the said patent and believe that I understand the same.

Int. 57. Kindly examine British patent No. 3497 of 1896, and state whether you understand the same.

Ans. I have carefully examined this patent and believe that I understand the same.

Int. 58. State whether you have made comparison between the machine illustrated in Plaintiff's Exhibit 233 and the machines illustrated, described and referred to in the claims of the two patents to which you have just made reference, and state whether you find any differences or likenesses between the same, and, if so, kindly point them out.

Ans. At the South Framingham factory I carefully compared machine No. 408 with the subject-matter of the Briggs patent No. 463,982, and while I found that in point of structure and organization of the two machines there is a vast difference, I also found that in point of generic subject-matter the structure of the Briggs patent 463,982 and the structure of the machine No. 408 is in certain material particulars the same. The particulars referred to are the subjects-matter of claims 1, 2 and 3 of the Briggs patent No. 463,982. This subject-matter I found to be fully embodied in the Universal rough rounding machine No. 408 at the South Framingham factory. At the same time and place I compared the said machine No. 408 with the two patents to French and Meyer, one for sole channeling and trimming machine, No. 600,883, dated March 22, 1898, and the other for trimming and channeling machine, No. 599,602, dated February 22, 1898. In making my comparison

of the last two patents with the machine at the South Framingham factory, I went into all the detail possible and found that the subject-matter of the two patents, in description and illustration and in nearly all the claims thereof, is embodied in said machine. While I did not compare specifically the two patents with the machine at the Whitman factory, my knowledge of the structure of the patents and of rough rounding machines enabled me to note that in point of structure and mode of operation the said Whitman machine No. 31 is in all material respects substantially the same as that of two French and Meyer patents Nos. 600,883 and 599,602. Subsequently, I compared the subject-matter of the British patent No. 3497 of 1896 with the subject-matter of the two French and Meyer patents Nos. 600,883 and 599,602, and find that the subject-matter of the British patent is substantially the same as that of the French and Meyer United States patent No. 600,883. In fact, the several illustrations of the two patents just referred to are substantially identical, reference characters and all. There are more figures of drawings in the United States patent, but they show simply different views of the same machine. I direct attention to the fact, also, that in my comparison I found that, in point of general subject-matter, the British patent's structure and that of the French and Meyer patent 599,602 is substantially the same, there being a few structural differences in the United States patent not found in the British patent. This may be due, however, to the fact that the copy of specification of the patent, which I have been able to obtain and examine, has been somewhat amended, presumably under the British practice, resulting in cancellation of certain portions of the specification of the British patent, leaving those portions, however, clearly readable, but completely eliminating certain claims and figures of the drawings of the patent. As to the claims of the two United States patents and the British patent, the subject-matter, after careful comparison by me, I find to be substantially the same. There is a great difference in claim, wording and phraseology of the British claims, due to the patent practice in Great Britain, but in point of substance and generic subject-matter the claims of the

British patent run to the same subject-matter as the two United States French and Meyer patents.

Mr. CHOATE. Please note our objection to all that part of the answer which refers to, or makes comparison with, the British patent 3497 of 1896 as not tending to support anything within the scope of the order or the bill, and as incompetent, irrelevant, immaterial and inadmissible, and as not responsive to the question.

Mr. WEBSTER. Petitioner offers in evidence the three United States patents referred to by the witness, the same being French and Meyer, trimming and channeling machine, No. 599,602, dated February 22, 1898; French and Meyer, sole channeling and trimming machine, No. 600,883, March 22, 1898; Briggs, rough rounding and channeling machine, No. 463,982, November 24, 1891.

[*Copies of patents enumerated above introduced in evidence and marked "Plaintiff's Exhibit No. 247".*]

Mr. WEBSTER. The petitioner also puts in evidence copy of British patent No. 3497 of 1896 to French and Meyer entitled "Improvement in machine for trimming and channeling soles of boots and shoes."

[*Copy of British patent No. 3497 of 1896 to French and Meyer entitled "Improvement in machine for trimming and channeling soles of boots and shoes", introduced in evidence and marked "Plaintiff's Exhibit No. 248".*]

Mr. CHOATE. Please note our objection to the introduction of Exhibit 248, as not tending to support anything within the scope of the order or the bill, as incompetent, immaterial, irrelevant and inadmissible.

Int. 59. Kindly state whether you have made a careful examination of the illustration of rapid outsole stitcher found on page 61 of the Goodyear Shoe Machinery catalogue of January 1, 1897, the same being Plaintiff's Exhibit 220, with the "Long" stitcher shown in photograph Plaintiff's Exhibit 208, to which you have heretofore made reference; and if you answer yes, state whether the machine referred to is the same or different from the machine illustrated on said page 61.

Mr. CHOATE. Please note the defendants' objection to this ques-

tion as relating to a branch of the inquiry upon which the witness has already been fully examined on direct and cross and as to which his examination has been completed.

Ans. I have made a careful comparison of the machine illustrated on page 61 of the Plaintiff's Exhibit No. 220 with the Long rapid stitcher illustrated in Plaintiff's Exhibit 208. In making that comparison I found that practically all the details of construction, so far as I can make them out in the cut on said page 61, are embodied in the said Long machine. In some respects I was, of course, compelled to simply compare the likeness of one part with another, but so far as I could determine the said Long machine embodies the entire structure and arrangement of parts shown in the cut at page 61 of the said Goodyear catalogue of 1897.

Int. 60. Kindly state whether you have recently examined a separator at the Whitman factory.

Ans. I have examined a separator at the Whitman factory bearing the number 124.

Int. 61. Kindly examine the cut shown on page 89 of Plaintiff's Exhibit 220 and compare the same with the separator which you say you examined, and point out the likenesses and differences, if any there be.

Ans. I made a careful comparison of the separator at the Whitman factory with the cut illustrated on page 89 of the said Plaintiff's Exhibit 220 and found that the said Whitman separator embodies substantially all the features of construction illustrated in the said cut at page 89 of the catalogue. A detail of difference between the two is the facial construction of the support for the material, that on the machine being without the concentric grooves which appear to be illustrated in the cut at page 89 of the catalogue. A feature of construction which I found in the Whitman machine, and which I am unable to determine positively is in the machine of the cut of the catalogue, relates to a means by which the denting and separating blade is held periodically from upward movement. This construction in the machine has the function of preventing unusually hard materials or an extra thick material from forcing the separating blade vertically. A device thus holds the blade in

proper position whereby to produce uniform work. As stated, the cut at page 89 of the catalogue is somewhat obscure as to this feature, and I am unable to say that the said feature is shown in the said cut. The machine which I examined has a name plate which includes the following: "Hadaway Stitch Separator, No. 124, Patented. Property of the Goodyear Shoe Machinery Co., Boston, Mass., Lessor."

Int. 62. Please examine the photograph I now hand you, being marked "Plaintiff's Exhibit 235", and state whether you have recently examined the machine of which said photograph is a picture.

Ans. I have examined the machine which is illustrated in this exhibit.

Int. 63. What is the type of machine referred to?

Ans. A channeling machine.

Int. 64. Please examine the cut on page 95 of the innersole channeler in the Goodyear catalogue Plaintiff's Exhibit 220, and compare the cut in the catalogue with the machine examined by you, and state the likenesses or differences.

Ans. After making a careful comparison of the machine illustrated in the catalogue in the cut on page 95, I am able to state that there are a couple of differences between it and the machine of the photograph Plaintiff's Exhibit 235. One difference has reference to the lever extending horizontally over the driving shaft of the machine, to which a chain is connected for the purpose of operating said lever, the latter having the function of lifting one of the cutting devices. Another difference is that a driving pulley has been added to the machine in the Whitman factory on the driving shaft adjacent to the crank. One other detail of difference is the adjusting means which is illustrated in the photograph exhibit, and which is present in the Whitman factory machine, this particular adjusting means for the cutter not being present in the catalogue machine at page 95, the adjustment there being simply a screw. The Whitman factory machine, or machine of the photograph Plaintiff's Exhibit 235, is substantially the same as that illustrated on page 4 of another catalogue which I have, Plaintiff's

Exhibit No. 190. The Whitman factory machine which I examined is No. 2,072.

Int. 64. Kindly state whether in mode of operation the machine you examined and the machine illustrated in the Goodyear catalogue are the same or different.

Ans. So far as I can determine, the mode of operation is the same. The machine, when I examined it, was set for special work, the special work being that which is illustrated by the piece of material on which I saw the machine operate, and which I here produce and have marked with the machine number "2,072".

Mr. WEBSTER. Specimen referred to by the witness put in evidence and marked "Plaintiff's Exhibit 249".

Int. 65. Kindly state whether you have recently, at the Whitman factory, examined an outsole channeler; and, if so, state whether you have compared the same with the outsole channeler illustrated on page 108 of Plaintiff's Exhibit 220.

Ans. I have examined such machine at the Whitman factory, said machine being 419, and carefully compared the same with the catalogue cut of such a machine at page 108, Plaintiff's Exhibit 220.

Int. 66. Kindly state what you found by way of likenesses or differences.

Ans. The Whitman factory machine is substantially identical with that of the catalogue cut at page 108, but I noted that the catalogue cut of the machine is lacking the cutter which was on the machine at the Whitman factory which I examined. The place for the application of the cutter is shown in the catalogue cut at page 108, and various cutters or knives are illustrated on pages 110, 111 and 112 of said catalogue.

Int. 67. Please examine the photograph I now hand you, the same being marked "Plaintiff's Exhibit 234", and state whether you have recently examined the machine of which said exhibit is a photograph.

Ans. I have examined that machine at the Whitman factory and found it to be machine No. 35.

Int. 68. Kindly examine the cut on page 28 of Plaintiff's Exhibit 190, the same being catalogue of the United Shoe Machin-

ery Company of 1902, and state the likenesses and differences between the machine examined by you and the illustration referred to.

Ans. I made a careful comparison of this machine at the Whitman factory with the photograph and also with the cut in the catalogue of Plaintiff's Exhibit 190 and found that the only difference in construction between the Whitman factory machine and that of the cut is in the shape of the leveling rollers. In the catalogue cut at page 28 the leveling rollers are shown as having a grooved contour longitudinally, while the rollers of the machine are straight cylinders. The rollers such as are illustrated in the cut of catalogue Plaintiff's Exhibit 190 were in a box beside the machine, and those I examined and compared with the cut and found to be the same as the latter.

Int. 69. State whether you have recently examined a pegging machine at the Whitman factory.

Ans. I have examined such machine.

Int. 70. Kindly examine cut on page 76 of Plaintiff's Exhibit 190, and compare the construction and operation of the machine illustrated in the cut with the machine examined by you.

Ans. The Whitman factory Davey pegging machine is what I would term an old style. The one in the catalogue at page 76 is what might be called a modernized machine. In general appearance the two machines are very much alike. There are, however, some differences between the two machines, which may be noted as follows: —

The horn, or support, on which the shoe rests during operation has its supporting shaft and co-operating springs exposed in the Whitman factory machine, while in the catalogue machine at page 76 such parts are apparently covered by a casing. In consequence, I am unable to state that the structure at this point is identical with that of the factory machine. The frame casting is slightly different in shape, that of the catalogue being a much more graceful and modernized structure and being much more compact than the Whitman factory machine. The Whitman factory machine has its driving wheel at the end of the driving shaft outside the casing.

In the catalogue machine at page 76 the driving wheel seems to be partially enclosed, and the structure of the head of this machine is much more compact. So far as I have been able to determine from the catalogue machine as shown in the cut, page 76, coupled with the description, it is my opinion that in point of general mode of operation and functional results the two machines are substantially the same. I am not able to say that the Davey pegging machine at the Whitman factory is able in its operation to drive two or three rows of pegs at one time, as seems to be the function of the catalogue machine.

Int. 71. State whether you have examined an Amazeen skiver recently at the Whitman factory and compared the same with the high-speed Amazeen skiving machine illustrated on page 132 of Plaintiff's Exhibit 190; and, if so, kindly state the likenesses and differences.

Ans. I examined several so-called Amazeen skivers at the Whitman factory and made comparison between the same and the Amazeen skivers illustrated on page 132 and also on page 136 of the catalogue. I found the following in connection with all the Whitman factory machines as compared with the two Amazeen skivers illustrated in the said catalogue. No one of the Whitman factory machines contains the gear or worm drive shown in the catalogue machines. The Whitman factory machines, each of them, has a pulley and belt drive for all the parts, the gears and worms being eliminated from said machines. The factory machines had been evidently made over and transformed from gear to belt drive, as the old framework of the gear-driven machine was present, and castings and supports for the belt-driving mechanism were applied to said frames. One of the frames, or supports, for the belt-drive which I examined had cast therewith the inscription: "Dunham Improvement, Patent Pending." In point of function and mode of operation, the Whitman factory machines are identical in all material and substantial respects with those of the two catalogue cuts at pages 132 and 136 of Plaintiff's Exhibit 190; that is to say, the obvious mode of operation of the catalogue machines is necessarily that of the several skiving machines at the Whitman factory,

since the arrangement of parts, which may be called the executive elements of the machine, is substantially the same in the factory machines as in the catalogue machines.

Mr. WEBSTER. So far as at present advised, I have nothing further to inquire of this witness at the present time. Opposing counsel are invited to cross-examine.

Mr. CHOATE. Does that complete Mr. Chapman's entire deposition?

Mr. WEBSTER. I think so. I may find something else. I am entirely frank to state as at present advised that completes it.

Mr. CHOATE. Relying upon that statement, we do not care to cross-examine.

Mr. WEBSTER. Petitioner offers in evidence group of patents, sixteen in number, being copies of patents specified in Plaintiff's Exhibit No. 3, being lease dated March 16, 1898, between the Goodyear Shoe Machinery Company and Kiner Brothers.

[*Copies of the following patents introduced in evidence and marked "Plaintiff's Exhibit 250":* —

C. Dancel and A. Eppler, Jr., sole sewing machine, No. 240,307, patented April 19, 1881;

D. H. Campbell, wax thread sewing machine, No. 253,156, patented January 31, 1882;

A. Keats, machine for sewing boots and shoes, No. 260,990, patented July 11, 1882;

M. H. Pearson, boot and shoe sewing machine, No. 267,798, patented November 21, 1882;

Z. T. French, sole sewing machine, No. 317,758, patented May 12, 1885;

Z. T. French, sole sewing machine, No. 317,759, patented May 12, 1885;

Z. T. French and W. C. Meyer, shoe sewing machine, No. 412,704, patented October 8, 1889;

Z. T. French, channeling machine, No. 453,999, patented June 9, 1891;

H. Briggs, method of forming chain stitches, No. 461,793, patented October 20, 1891;

H. Briggs, rough rounding and channeling machine, No. 463,-967, patented November 24, 1891;

I. LaChapelle, tension device for sewing machines, No. 488,505, patented December 20, 1892;

H. E. Cole, sewing machine, No. 495,452, patented April 11, 1893;

H. Briggs, take-up for shoe sewing machines, No. 518,911, patented April 24, 1894.]

Mr. WEBSTER. I should like to change that. It is thirteen patents recited in Plaintiff's Exhibit No. 3, being the patents recited in said lease up to and including the one dated April 24, 1894, offered for the purpose of showing that the lessor was at that time putting out machines under patents, and which patents expired prior to the filing of the petition in this case.

[*Signature waived.*]

Attest: CHARLES K. DARLING, *Special Examiner.*

[*Adjourned subject to agreement of counsel.*]

DISTRICT COURT OF THE UNITED STATES,

DISTRICT OF MASSACHUSETTS.

IN EQUITY.

No. 301 (C. C. 911).

UNITED STATES OF AMERICA, PETITIONER,

v.

UNITED SHOE MACHINERY COMPANY, OF NEW JERSEY, ET AL., RESPONDENTS.

ORDER EXTENDING TIME FOR TAKING TESTIMONY BEFORE EXAMINER UNDER ORDER DATED JUNE 27, 1913.

September 12, 1913.

PUTNAM, DODGE and BROWN, JJ. It is ordered (both parties consenting hereto) that the times for taking testimony under the order dated June 27, 1913, as modified by the order of August 8, 1913, be further extended so that the petitioner be allowed until September 1, 1913, inclusive, for evidence in chief; the respond-

ents be allowed until November 1, 1913, inclusive, for evidence in defence, and the petitioner be allowed to November 14, 1913, inclusive, for rebuttal.

By the Court,
CHARLES K. DARLING, *Clerk.*

The above-named parties hereby consent to the entry of the foregoing order.

CHARLES F. CHOATE, JR.,
for Defendant.
WILLIAM S. GREGG,
Special Assistant to the Attorney General.

BOSTON, MASS., October 6, 1913.

Mr. WEBSTER. By virtue of agreement made between counsel for petitioner and defendants, entered into before the expiration of the petitioner's time to introduce evidence, that petitioner might, after the expiration of the time assigned to it, introduce copies of patents, certified copies of assignments of patents, and the testimony of one witness, all to have the same force and effect as if introduced during the time allotted to the petitioner, the petitioner now offers the following: —

Petitioner offers in evidence two bound volumes, A and B, comprising copies of United States patents recited in lease and license agreement between McKay Heeling Machine Association and Selz, Schwab & Company dated March 21, 1898, said lease having been introduced in evidence as Plaintiff's Exhibit No. 240, said patents being numbered, dated and entitled as follows: —

No. 212,116.

No. 212,190, Chase, February 11, 1879; burnishing tool (expired February 11, 1896).

No. 217,866, Glidden, July 29, 1879; heel trimming machine (expired July 29, 1896).

No. 217,867, Glidden, July 29, 1879; heel trimming machine (expired July 29, 1896).

No. 224,005, Fairfield, February 3, 1880; machinery for sorting pieces of leather (expired February 3, 1897).

No. 224,011, Glidden, February 3, 1880; heel slicing machine (expired February 3, 1897).

No. 224,012, Glidden, February 3, 1880; machine for forming heel pile (expired February 3, 1897).

No. 233,504.

No. 236,148, Ferren, January 4, 1881; heel breasting machine (expired January 4, 1898).

No. 246,945, Fisher, September 13, 1891; machine for repairing heels for boot and shoes (expired September 13, 1898).

No. 248,582, Fisher, October 25, 1881; heel nailing machine (expired October 25, 1898).

No. 250,654, Fisher, December 13, 1881; machine for attaching heels to boots and shoes (expired December 13, 1898).

No. 252,215, Henderson, January 10, 1882; heel nailing machine (expired January 10, 1899).

No. 258,905, Fisher, June 6, 1882; boot and shoe heeling machine (expired June 6, 1899).

No. 259,687, Henderson, June 20, 1882; heel nailing machine (expired June 20, 1899).

No. 261,696, Fifield, July 25, 1882; heel trimming machine (expired July 25, 1899).

No. 266,298, McMullett, October 24, 1882; last (expired October 24, 1899).

No. 267,544, King and Strong, November 14, 1882; heel trimming machine (expired November 14, 1899).

No. 271,117, Raymond, January 23, 1893; heel nailing machine (expired January 23, 1900).

No. 271,118, Raymond, January 23, 1883; heel nailing machine (expired January 23, 1900).

No. 280,399, Raymond, January 3, 1883; heel nailing machine (expired January 3, 1900).

No. 277,207, Bourgeois, May 8, 1883; heel burnishing tool (expired May 8, 1900).

No. 278,426, Glidden, May 29, 1883; last (expired May 29, 1900).

No. 280,861, Raymond and Wheeler, July 10, 1883; heel nailing machine (expired July 10, 1900).

No. 287,472, Raymond 2d, October 30, 1883; heel nailing machine (expired October 30, 1900).

No. 289,857, Raymond, December 11, 1883; heel nailing machine (expired December 11, 1900).

No. 290,109, Raymond, December 11, 1883; heel nailing machine (expired December 11, 1900).

No. 293,604, Tyler and Smith, February 12, 1884; machine for finishing heel bottoms (expired February 12, 1901).

No. 297,787, Gordon and Dodge, April 29, 1884; trace trimming machine (expired April 29, 1901).

No. 301,462, Tyler, July 1, 1884; pegging machine (expired July 1, 1901).

No. 305,723, Tyler, September 23, 1884; heel nailing machine (expired September 23, 1901).

No. 310,488, Allen, January 6, 1885; heel nailing machine (expired January 6, 1902).

No. 314,411, Allen, March 24, 1885; heeling block (expired March 24, 1902).

No. 315,069, Raymond, April 7, 1885; heel nail plate (expired April 7, 1902).

No. 315,070, Raymond, April 7, 1885; wire heel nail blank (expired April 7, 1902).

No. 315,458, Raymond, April 7, 1885; nail holder and carrier (expired April 7, 1902).

No. 316,177, Raymond, April 21, 1885; heel attaching machine (expired April 21, 1902).

No. 316,827, Raymond, April 28, 1885; heel nailing machine (expired April 28, 1902).

No. 316,826, Raymond, April 28, 1885; heel nailing machine (expired April 28, 1902).

No. 316,661, Raymond, April 28, 1885; heel nailing machine (expired April 28, 1902).

No. 316,894, Henderson, April 28, 1885; heel nailing machine (expired April 28, 1902).

No. 10,588, Henderson, April 28, 1885; heel nailing machine (expired January 10, 1899).

No. 10,589, Henderson, April 28, 1885; heel nailing machine (expired June 20, 1899).

No. 317,199, Raymond, May 5, 1885; heel nailing machine (expired May 5, 1902).

No. 317,672, Raymond, May 12, 1885; heel nailing machine (expired May 12, 1902).

No. 317,647, Henderson, May 12, 1885; heel nailing machine (expired May 12, 1902).

No. 317,646, Henderson, May 12, 1885; heel nailing machine (expired May 12, 1902).

No. 317,851, Raymond, 2d, May 12, 1885; heel nailing machine (expired May 12, 1902).

No. 318,134, Raymond, May 19, 1885; heel nailing machine (expired May 19, 1902).

No. 319,124, Raymond, June 2, 1885; heel distributer for heel nailing machine (expired June 2, 1902).

No. 319,377, Allen, June 2, 1885; heeling machine (expired June 2, 1902).

No. 321,401, Tyler and Merritt, June 30, 1885; heeling machine (expired June 30, 1902).

No. 321,530, Raymond, 2d, July 7, 1885; heel nailing machine (expired July 7, 1902).

No. 322,126, Raymond, July 14, 1885; heel attaching machine (expired July 14, 1902).

No. 320,050, Demary, June 16, 1885; heel attaching machine (expired June 16, 1902).

No. 321,696, Demary, July 7, 1885; manufacturing and attaching heels to boots or shoes (expired July 7, 1902).

No. 321,756, Raymond 2d, July 7, 1885; heel nailing machine (expired July 7, 1902).

No. 322,562, Raymond, July 21, 1885; sole nailing machine (expired July 21, 1902).

No. 322,561, Raymond, July 21, 1885; process of applying top lifts to heel blanks (expired July 21, 1902).

No. 322,560, Raymond, July 21, 1885; heel nailing machine (expired July 21, 1902).

No. 321,017, Glidden, June 30, 1885; heel trimming machine (expired June 30, 1902).

No. 322,945, Manley, July 28, 1885; heel sole edge trimming machine (expired July 28, 1902).

No. 325,272, Raymond, September 1, 1885; heel making machine (expired September 1, 1902).

No. 325,271, Raymond, September 1, 1885; method of making heel nail plates (expired September 1, 1902).

No. 326,150, Raymond, September 15, 1885; method of attaching soles to boots and shoes (expired September 15, 1902).

No. 326,782, Raymond, September 22, 1885; nail for boots or shoes (expired September 22, 1902).

No. 326,781, Raymond, September 22, 1885; nailing machine (expired September 22, 1902).

No. 326,780, Raymond, September 22, 1885; nailing machine (expired September 22, 1902).

No. 326,779, Raymond, September 22, 1885; heel attaching machine (expired September 22, 1902).

No. 329,079, Raymond, October 27, 1885; heel nailing machine (expired October 27, 1902).

No. 329,952, Raymond, November 10, 1885; sole or heel fastening (expired November 10, 1902).

No. 329,951, Raymond 2d, November 10, 1885; heel nailing machine (expired November 10, 1902).

No. 331,441, Raymond, December 1, 1885; heel nailing machine (expired December 1, 1902).

No. 332,032, Allen, December 8, 1885; nailing machine for boots and shoes (expired December 8, 1902).

No. 332,798, Henderson, December 22, 1885; heel nailing machine (expired December 22, 1902).

No. 332,984, Allen, December 22, 1885; heel trimming machine (expired December 22, 1902).

No. 335,242, Raymond, February 2, 1886; heel nailing machine (expired February 2, 1903).

No. 335,241, Raymond, February 2, 1886; method of attaching heels (expired February 2, 1903).

No. 336,332, Manley, February 16, 1886; boot or shoe edge trimming machine (expired February 16, 1903).

No. 340,358, Raymond, April 20, 1886; boot or shoe sole (expired April 20, 1903).

No. 480,415, Raymond, August 9, 1892; heel loading machine (expired August 9, 1909).

No. 480,741, Raymond, August 16, 1892; jack for heel nailing machine (expired August 16, 1909).

No. 483,293, Webster, September 27, 1892; method of attaching heels to boots or shoes (expired September 27, 1909).

No. 498,429, Glidden, May 30, 1893; nail assorting machine (expired May 30, 1910).

No. 498,745, Fairfield, May 30, 1893; rotary cutter (expired May 30, 1910).

No. 498,513, Glidden, May 30, 1893; heeling machine (expired May 30, 1910).

No. 500,486, Glidden, June 27, 1893; heel nailing machine (expired June 27, 1910).

No. 501,555, Winter, July 18, 1893; method of making rotary tooth cutters (expired July 18, 1910).

No. 502,669, Glidden, August 1, 1893; heel nailing machine (expired August 1, 1910).

No. 502,667, Glidden, August 1, 1893; heel compressing and loa ..g machine (expired August 1, 1910).

No. 502,668, Glidden, August 1, 1893; heel compressing and loading machine (expired August 1, 1910).

No. 503,895, Benjamin and Simmons, August 22, 1893; nail separating and feeding devices (expired August 22, 1910).

No. 503,895, Benjamin and Simmons, August 22, 1893; nail separating and feeding devices (expired August 22, 1910).

No. 504,854, Webster, September 12, 1893; machine for breasting heels of boots or shoes (expired September 12, 1910).

No. 505,074, Webster, September 12, 1893; heel attaching machine (expired September 12, 1910).

No. 505,043, Glidden and Winter, September 12, 1893; heel trimming machine (expired September 12, 1910).

No. 510,012, Elliott, December 5, 1893; heeling machine (expired December 5, 1910).

No. 514,852, Krewson, February 13, 1894; jack for heel nailing machines (expired February 13, 1911).

No. 518,917, Fairfield, April 24, 1894; rotary cutter (expired April 24, 1911).

No. 528,805, Raymond, November 6, 1894; nail making, distributing and driving device (expired November 6, 1911).

No. 530,046, Heys, November 27, 1894; heel pressing machine (expired November 27, 1911).

No. 531,644, Raymond, 2d, January 1, 1895; nail feeding implement (expired January 1, 1912).

No. 531,645, Raymond, January 1, 1895; nail feeding implement (expired January 1, 1912).

Comprising among said patents eighty-three on heel nailing, twenty-three on heel attaching, thirteen on heeling machines, fifteen on nails, sixteen on nail making, distributing and driving, besides 150 on miscellaneous machines and appliances.

Attention is also called to the fact that of said patents, over 300 in number, thirty expired prior to 1902, forty-six expired in 1902, thirty-nine expired in 1903, twenty-nine expired in 1904, fifty-four expired in 1905, fifty-one expired in 1906, fifteen expired in 1908, twenty-two expired in 1909, and that all but three of said total number of over 300 patents had expired prior to the filing of the petition herein.

(NOTE. Because of some of the numbers mentioned in the lease having apparently been transposed several of the patents apparently intended to have been referred to in the lease are omitted, as they could not be found.)

Said two bound volumes of patents are introduced as physical exhibits, and are marked "Plaintiff's Exhibits 251 A" and "251 B", and notice is given that the petitioner will not cause said physical exhibits to be reproduced unless upon the order or approval of the court or upon the request of counsel for either party, such request having the approval of the court.

[*Two bound volumes of patents as described above introduced in evidence, and marked "Plaintiff's Exhibit 251 A" and "Plaintiff's Exhibit 251 B".*]

Mr. WEBSTER. Petitioner offers in evidence group of sixteen patents, being the patents to which particular attention was called at the time Plaintiff's Exhibit 238 was introduced, being the sixteen patents, to which attention was called, found in the lease of the Consolidated & McKay Lasting Machine Company to Selz, Schwab & Company, dated December 17, 1898.

[*Group of patents as described introduced in evidence and marked "Plaintiff's Exhibit 252".*]

Mr. WEBSTER. Petitioner offers in evidence a certified copy of assignment from Sidney W. Winslow to McKay Shoe Machinery Company, dated June 1, 1900, recorded in United States Patent Office in Liber M-61, page 148, conveying to said McKay Shoe Machinery Company patent as follows: —

Patent issued to W. S. Hamm for stapling machine, No. 447,681, dated March 3, 1891.

Petitioner also offers in evidence copy of the patent referred to in said assignment.

[*Certified copy of assignment from Winslow to McKay, dated June 1, 1900, with copy of patent, introduced in evidence and marked "Plaintiff's Exhibit 253".*

Stipulation by counsel that the assignments of patents may be introduced as physical exhibits and not be reproduced and spread upon the record without request of counsel or order of the court.]

Mr. WEBSTER. Petitioner offers in evidence as a physical exhibit a certified copy of assignment from Christian Dancel to Goodyear Shoe Machinery Company, of Connecticut, dated January 2, 1892, as recorded in the United States Patent Office, in Liber S-57, page 463, conveying to said Goodyear Company patents as follows: —

Patent to C. Dancel, for machine for winding bobbins, No. 420,441, dated February 4, 1890.

Patent issued to C. Dancel, for sewing machine, No. 449,036, dated September 8, 1891.

Petitioner also offers in evidence copies of the patents referred to in said assignment to go in as one exhibit in connection with the assignment, all being put in as a physical exhibit.

[*Certified copy of assignment from Christian Dancel to Goodyear Shoe Machinery Company, dated January 2, 1892, with copy of patents, introduced in evidence, and marked "Plaintiff's Exhibit 254".*]

The EXAMINER. Now, in order that there may be no misunderstanding, if these go in as physical exhibits, it is understood that there are to be obtained three copies identically like them for use in the District Court.

Mr. FISH. Can't we leave that for the present? He puts it in, it is not reproduced without request of counsel or court, and later we can enforce that request for three copies if we want them.

The EXAMINER. Nothing that has been put in this morning is to be reproduced.

Mr. WEBSTER. Except upon request of either party or by direction of the court. Is that right, Mr. Fish, Mr. Choate?

Mr. CHOATE. Certainly.

Mr. WEBSTER. The petitioner offers in evidence a certified copy of assignment from Campbell Machine Company to Goodyear Shoe Machinery Company dated November 19, 1897, as recorded in United States Patent Office in Liber Z-56, page 243, conveying to said Goodyear Shoe Machinery Company patents as follows: —

Patent issued to D. H. Campbell for sewing machine, No. 231,954, dated September 7, 1880.

Patent issued to D. H. Campbell for sewing machine, No. 241,-608, dated May 17, 1881.

Patent issued to D. H. Campbell for sewing machine, No. 241,-609, dated May 17, 1881.

Patent issued to D. H. Campbell for sewing machine, No. 241,-610, dated May 17, 1881.

Patent issued to D. H. Campbell for sewing machine, No. 241,-611, dated May 17, 1881.

Patent issued to D. H. Campbell for sewing machine, No. 241,-612, dated May 17, 1881.

Patent issued to D. H. Campbell for sewing machine, No. 241,-613, dated May 17, 1881.

Patent issued to D. H. Campbell for wax thread sewing machine, No. 253,157, dated January 31, 1882.

Patent issued to A. B. Fowler for burnishing and trimming machine, No. 352,864, dated November 16, 1886.

Patent issued to E. C. Ross for presser foot and welt guide combined, No. 366,259, dated July 12, 1887.

Patent issued to A. B. Fowler for heel burnishing machine, No. 372,612, dated November 1, 1887.

Patent issued to D. H. Campbell for wax thread sewing machine, No. 374,934, dated December 20, 1887.

Patent issued to D. H. Campbell for machine for waxing thread and winding it into cops, No. 374,935, dated December 20, 1887.

Patent issued to D. H. Campbell for take-up device for wax thread sewing machines, No. 374,936, dated December 20, 1887.

Patent issued to D. H. Campbell for sewing machine shuttle, No. 374,937, dated December 20, 1887.

Patent issued to A. B. Fowler for burnishing machine, No. 377,-826, dated February 14, 1888.

Patent issued to Fowler and Warren for burnishing or trimming tool, No. 384,902, dated June 19, 1888.

Patent issued to W. C. Evans for heel burnishing machine, No. 385,702, dated July 10, 1888.

Patent issued to G. Ambon, Jr., for wax thread sewing machine, No. 388,752, dated August 28, 1888.

Patent issued to J. H. Ryder for heel beading machine, No. 388,790, dated August 28, 1888.

Patent issued to W. F. Nesmith for presser foot for sewing machine, No. 391,981, dated October 30, 1888.

Patent issued to Fowler and Warren for heel finishing machine, No. 396,690, dated January 22, 1889.

Patent issued to J. S. Turner for shoe welt sewing machine, No. 407,974, dated July 30, 1889.

Patent issued to G. Ambon, Jr., for combined welt and upper guide, No. 407,987, dated July 30, 1889.

Patent issued to D. H. Campbell for machine for waxing thread and winding the same on bobbins, No. 409,270, dated August 20, 1889.

Patent issued to E. P. Arnold for thread controlling device, No. 421,889, dated February 25, 1890.

Patent issued to A. B. Fowler for rotary cutter and trimmer, No. 425,214, dated April 8, 1890.

Patent issued to G. Ambon, Jr., for wax thread sewing machine, No. 425,722, dated April 15, 1890.

Patent issued to Fowler, Warren and Evans for heel burnishing machine, No. 438,997, dated October 21, 1890.

Patent issued to C. E. Wheeler for sewing machine, No. 446,398, dated February 10, 1891.

Patent issued to Fowler and Warren for heel burnishing machine, No. 452,345, dated May 12, 1891.

Patent issued to D. H. Campbell for wax pot for use in machines for waxing thread, No. 456,536, dated July 21, 1891.

Patent issued to G. E. Warren for scouring roll, No. 462,886, dated November 10, 1891.

Patent issued to Metcalf and Godding for sewing machine, No. 469,374, dated February 23, 1892.

Patent issued to Fowler and Warren for heeling trimming machine, No. 503,475, dated August 15, 1893.

Patent issued to E. P. and E. F. Arnold for welt guiding device for shoe sewing machine, No. 510,150, dated December 5, 1893.

Patent issued to J. W. Hynes for box loop attachment for sewing machine, No. 510,792, dated December 12, 1893.

Patent issued to Fowler and Warren for sewing machine, No. 549,353, dated November 5, 1895.

Patent issued to Fowler and Warren for shuttle driving mechanism for sewing machine, No. 560,704, dated May 26, 1896.

Patent issued to D. McNiven for buffing or polishing wheel, No. 577,111, dated February 16, 1897.

Patent issued to G. E. Warren for sewing machine, No. 583,522, dated June 1, 1897.

Patent issued to S. H. Dyer for shuttle for sewing machine, No. 583,793, dated June 1, 1897.

Patent issued to S. H. Dyer for sewing machine, No. 584,543, dated June 15, 1897.

Petitioner also offers in evidence copies of the patents referred to in said assignment.

[*Certified copy of assignment from Campbell Machine Company to Goodyear Shoe Machinery Company, dated November 19, 1897, with copies of patents, introduced in evidence, and marked "Plaintiff's Exhibit 255".*

Mr. WEBSTER. The petitioner offers in evidence a certified copy of assignment from Sidney W. Winslow to McKay Shoe Machinery Company, dated March 15, 1898, as recorded in United States Patent Office in Liber B-58, page 5, conveying to said McKay Shoe Machinery Company patents as follows: —

Patent issued to A. B. Smith for stapling machine, No. 335,154, dated February 2, 1886.

Patent issued to W. S. Hamm for stapling machine, No. 521,369, dated June 12, 1894.

Patent issued to Hamm and Eaton for machine for making and driving metallic fastenings, No. 571,227, dated November 10, 1896.

Petitioner also offers in evidence copies of the patents referred to in said assignment.

[*Certified copy of assignment from Winslow to McKay Shoe Machinery Company dated March 15, 1898, with copies of patents, introduced in evidence, and marked "Plaintiff's Exhibit 256".*]

Mr. WEBSTER. The petitioner offers in evidence a certified copy of assignment from John R. Nolan to Consolidated & McKay Lasting Machine Company, dated March 23, 1898, as recorded in United States Patent Office in Liber Y-57, page 38, conveying to said Consolidated & McKay Lasting Machine Company patents as follows: —

Patent issued to J. Q. A. Houghton for lasting machine, No. 385,557, dated July 3, 1888.

Petitioner also offers in evidence copy of the patent referred to in said assignment.

[*Certified copy of assignment from John R. Nolan to Consolidated & McKay Lasting Machine Company dated March 23, 1898, with copy of patent, introduced in evidence, and marked "Plaintiff's Exhibit 257".*]

Mr. WEBSTER. The petitioner offers in evidence a certified copy of assignment from Gordon McKay to Consolidated & McKay Lasting Machine Company, dated November 12, 1897, as recorded in United States Patent Office in Liber P-55, page 498, conveying to said Consolidated & McKay Lasting Machine Company patents as follows: —

Patent issued to M. J. Ferren for instep holder for shoes, No. 233,844, dated November 2, 1880.

Patent issued to McKay and Fairfield for instep holder, No. 234,488, dated November 16, 1880.

Patent issued to H. P. Fairfield for lasting machine, No. 234,912, dated November 30, 1880.

Patent to H. G. Thompson for upper for boots and shoes, No. 237,638, dated February 8, 1881.

Patent issued to H. P. Fairfield for boot and shoe upper, No. 240,585, dated April 26, 1881.

Patent issued to L. R. Blake for machine for lasting boots and shoes, No. 241,524, dated May 17, 1881.

Patent issued to G. McKay for expanding last, No. 245,303, dated August 9, 1881.

Patent issued to G. McKay for lasting machine, No. 251,452, dated December 27, 1881.

Patent issued to Thompson and Mower for lasting machine, No. 251,487, dated December 27, 1881.

Patent issued to E. P. Richardson for lasting machine No. 311,-850, dated February 3, 1885.

Patent issued to E. P. Richardson for lasting machine, No. 311,-851, dated February 3, 1885.

Patent issued to C. W. Glidden for lasting machine, No. 248,-448, dated October 18, 1881.

Patent issued to McKay and Fairfield for lasting machine, No. 250,450, dated December 6, 1881.

Patent issued to W. E. Fisher for lasting machine, No. 251,205, dated December 20, 1881.

Patent issued to C. W. Glidden for lasting machine, No. 251,-430, dated December 27, 1881.

Petitioner also offers in evidence copies of the patents referred to in said assignment.

[*Certified copy of assignment from Gordon McKay to Consolidated & McKay Lasting Machine Company, dated November 12, 1897, with copies of patents, introduced in evidence, and marked "Plaintiff's Exhibit 258".*]

Mr. WEBSTER. It being uncertain as to whether patents now to be introduced have been introduced heretofore, it is agreed that if it is found they have been heretofore introduced these exhibits may be withdrawn; is that right?

Mr. CHOATE. Yes.

Mr. WEBSTER. Petitioner offers in evidence group of patents on the list of patents read into the record by Mr. Howard, the inventions of which patents were, as petitioner understands, stated by Mr. Howard, incorporated in machines and which patents expired after the organization of the United Company and before the filing of the petition, such patents being as follows: —

Patent to C. Dancel, sole sewing machine, dated July 19, 1887, No. 366,935.

Patent to French and Meyer, sewing machine, dated October 8, 1889, No. 412,703.

Patent to French and Meyer, shuttle for sewing machines, dated April 8, 1890, No. 424,966.

Patent to French and Meyer, sole sewing machine, dated April 25, 1892, No. 473,870.

Patent to French and Meyer, sole sewing machine, dated May 10, 1892, No. 474,774.

[*Group of patents described above introduced in evidence, and marked "Plaintiff's Exhibit 259".*]

Mr. WEBSTER. The petitioner also offers under the same heading copies of patents as follows: —

Patent to French, sole sewing machine, dated May 12, 1885, No. 317,759.

Patent to French and Meyer, shoe sewing machine, dated October 8, 1889, No. 412,704.

Patent to Briggs, method of forming chain stitches, dated October 20, 1891, No. 461,793.

Patent to LaChapelle, tension device for sewing machine, dated December 20, 1892, No. 488,505.

Patent to H. E. Cole, sewing machine, dated April 11, 1893, No. 495,452.

Patent to E. P. and H. H. Arnold, shoe sewing machine, dated October 31, 1893, No. 507,873.

Patent No. 518,911 — which is out of print and I would like to furnish it hereafter.

[*Group of patents described above marked "Plaintiff's Exhibit 260".*]

Mr. WEBSTER. As at present advised this closes the petitioner's case in reference to the presenting of evidence under the order.

EVIDENCE FOR DEFENDANTS.

TAKEN PURSUANT TO ORDER OF COURT, ENTERED JUNE 27, 1913, BEFORE ME.

CHARLES K. DARLING,
Special Examiner.

BOSTON MASS., October 6, 1913.

Present:

ALLEN WEBSTER, Esq., *Special Assistant to the Attorney General, of Counsel for Complainant:*

FREDERICK P. FISH, Esq., *and* CHARLES F. CHOATE, Jr., Esq., *of Counsel for Defendants.*

DEPOSITION OF NELSON W. HOWARD.

Direct Examination by CHARLES F. CHOATE, Jr., Esq., *of Counsel for Defendants.*

Int. 1. State your full name, your residence and occupation, Mr. Howard.

Ans. Nelson W. Howard; Boston; I am a member of the bar, in charge of the patent department of the United Shoe Machinery Company.

Int. 2. State how long you have been in practice, the character of your practice and your experience generally.

Ans. Immediately after graduating from the Harvard Law School in 1895 I became connected with the firm of Fish, Richardson & Storrow, now named Fish, Richardson, Herrick & Neave. I remained with that firm for nearly three years. During that time I was exclusively engaged in work relating to patents, and a considerable portion of my time was spent in connection with litigation involving shoe machines and shoe machinery patents. On September 1, 1898, I became connected with the McKay Shoe Machinery Company, taking charge of the patent interests of that company. When the United Shoe Machinery Company was formed

in February, 1899, I assumed a similar position with that company, and from that date to the present time I have been in charge of the patent department of that company. During the period of about fifteen years since I became connected with the McKay Shoe Machinery Company my time has been devoted exclusively to matters relating to machines and methods used in the manufacture of shoes and to patents and patent applications on such machines and methods. My duties have comprised largely the comparison of the claims of patents and of applications for patents with the structures of machines. My duties have required frequent visits to shoe factories, and the observation and study of machines as they are used in the manufacture of shoes.

Int. 3. Please state fully your familiarity with the art and development of shoe machinery.

Ans. In connection with the prosecutions of applications for patents and general investigations of questions of infringement and anticipations I have had occasion to become familiar, in the course of the period of fifteen years during which I have been engaged upon this work, with the patents which have been granted upon shoe machines and methods for use in the manufacture of shoes from the beginning of the art.

Int. 4. In connection with the same work and during the same period, have you had occasion to follow and keep yourself familiar with the mechanical development of the art?

Ans. In order to do properly the work which I have had to do, it has been indispensable that I follow and be constantly familiar with the development of the art from day to day.

Int. 5. To what extent have you been, and are you now, familiar with the development of the manufacture of shoe machinery by the United Shoe Machinery Company, particularly in connection with the work carried on at its factory, and by conference or consultations with its engineers and inventors?

Ans. A proper discharge of my duties has required that I be in constant association with the mechanical experts and with the inventors employed by the United Shoe Machinery Company, and that I be constantly familiar with the experimental work which is

being carried on in improving the machines and developing new machines, and that I frequently examine experimental machines in their course of development in the company's experimental department at its manufacturing plant in Beverly.

Int. 6. State how familiar you are and have been with the commercial development of the machines put out by the United Company and their improvements and developments from time to time.

Ans. Again, the proper discharge of my duties has required that I become thoroughly familiar not only with machines as they have been constructed and used in the past but also with each improvement made upon the machines and with every new machine which has superseded an old machine. The obtaining of patents for all such improvements and new machines has been one of my principal duties, and familiarity both with the prior art and the improvements which were the subjects-matter of patent applications was of course indispensable to proper preparation and prosecution of such applications.

Int. 7. Have you, at our request, prepared a list of some of the improved machines put out by the United Shoe Machinery Company showing as to each machine the date when it was first put out by that company (to avoid unduly encumbering the record, I did not ask you to list all such machines), and if you have prepared such a list will you please produce it?

Ans. I have prepared such a list and do now produce it. I read the list: —

October 3, 1913.

SOME OF THE IMPORTANT MACHINES PUT OUT BY THE UNITED SHOE MACHINERY COMPANY.

	Department	First Put Out by U. S. M. Co.
Assembling machine, Rex	Pulling over	Sept. 1905
Assembling machine, model E, Rex	Pulling over	Aug. 1910
Assembling machine, Rex turn shoe	Pulling over	Feb. 1912
Assembling spindle	Pulling over	Sept. 1904
Beading machine, Columbia	General	Nov. 1907
Beating and slashing machine, Goodyear welt	Goodyear	Nov. 1904

Beveling machine, model B, Champion strip	General	Nov. 1909
Blacking machine, model A, Crest heel	General	Sept. 1908
Blacking machine, model B, Crest heel	General	May 1911
Building machine, Pyramid heel, models B, C, D	General	June 1909
Burnishing machine No. 2, Goodyear impression stitch	Goodyear	April 1908
Cementing machine, Hub lining, models E and F	General	May 1908
Cementing machine, model X, Stanbon channel	General	April 1911
Cementing machine, Star channel, models A and C	General	Oct. 1906
Cementing machine, Star channel, model D	General	April 1912
Channeling machine, Economy insole	Goodyear	May 1905
Channeling machine, Goodyear (insole and turn)	Goodyear	Feb. 1899
Channeling machine, Goodyear Universal (turn work)	Goodyear	Nov. 1908
Channeling machine, Goodyear Universal (welt work)	Goodyear	Sept. 1907
Clicking machine, model C, Ideal	General	Mar. 1908
Clinch machine, Universal double	Metallic	Nov. 1899
Compressing machine, model No. 4, Automatic heel	Heeling	Sept. 1900
Cutting and scoring machine, insole, models D and E	General	Dec. 1911
Embossing machine, model B	General	Jan. 1911
Eyeleting machine, Cameo foot power	Eyeleting	April 1910
Eyeleting machine, Duplex	Eyeleting	July 1902
Eyeleting machine, Universal	Eyeleting	Nov. 1902
Fastening machine, model D, Staple	Metallic	Jan. 1907
Finishing machine, USMC buttonhole	Fitting room	Jan. 1913
Flexible innersole machine, model X, Goodyear	Goodyear	Jan. 1911

Flexible Insole machine, Gem	Goodyear	Sept. 1900
Fudge Edge machine, Goodyear	Goodyear	May 1908
Generating machine, Goodyear pattern	Goodyear	Mar. 1911
Grooving and beveling machine, Goodyear power welt	Goodyear	July 1906
Heel-breasting machine, model B, Imperial	General	July 1902
Indenting and burnishing machine, Goodyear welt	Goodyear	July 1905
Jointing machine, Goodyear	Goodyear	Nov. 1910
Lacing machine, Ensign, models A and B	Fitting room	Feb. 1906
Lasting machine, Consolidated hand method	Lasting	Feb. 1899
Lasting machine, McKay & Copeland	Lasting	Feb. 1899
Lasting machine, No. 5 U. S. M. C.	Lasting	Jan. 1908
Laying machine, model A, Apex welt	General	Feb. 1910
Laying machine, model X, Apex welt	General	Feb. 1911
Laying machine, Goodyear channel	Goodyear	Feb. 1899
Laying machine, Goodyear improved sole, models B and C	Goodyear	Dec. 1910
Laying machine, Goodyear improved sole, twin	Goodyear	Dec. 1906
Leveling machine, model A, Atlas	General	Sept. 1903
Leveling machine, Goodyear automatic sole, models A, B, C	Goodyear	Feb. 1899
Leveling machine, Goodyear welt and turn (turn work)	Goodyear	June 1906
Leveling machine, Goodyear welt and turn (welt work)	Goodyear	June 1906
Leveling machine, Hercules, models A and B	General	Apr. 1903
Leveling and flexing machine, model N, Shin	General	Feb. 1906
Loading and attaching machine, McKay automatic heel	Heeling	Feb. 1899

Loading and attaching machine, model B, McKay automatic heel	Heeling	Nov. 1910
Lockstitch machine, model K, Goodyear outsole rapid	Goodyear	May 1910
Lockstitch machine, model M, Goodyear outsole rapid	Goodyear	Jan. 1912
Making machine, buttonhole	Fitting room	Jan. 1913
Marker, improved Star sole	General	Oct. 1910
Marking machine, model C, Paragon vamp	General	May 1906
Molding machine, American twin sole, models B and C	General	May 1907
Molding machine, Goodyear power	Goodyear	June 1910
Molding machine, stitch down upper	General	Nov. 1907
Nailing machine, Alpha wood heel	Heeling	Sept. 1907
Nailing machine, American Lightning	Heeling	Feb. 1899
Nailing machine, Loose	Metallic	Feb. 1899
Nailing machine, Hungarian	Metallic	Feb. 1899
Nailing machine, No. 2, Loose	Metallic	1909
Nurling machine, model A	Heeling	July 1901
Opening machine, model C, Apex channel	General	July 1906
Pegging machine, Davey	Metallic	Feb. 1899
Perforating machine, model B, Royal	General	Oct. 1904
Perforating machine, model M, Stanbon	General	Apr. 1911
Pincer, U. S. M. C. bench	General	1911
Pounding machine, model E, Rex	Pulling over	1904
Pounding machine, model C, Rex rotary	Pulling over	Mar. 1912
Pounding and beating up machine, model A, Rex rotary	Pulling over	Mar. 1912
Pounding and trimming machine, model B, Rex rotary	Pulling over	July 1908
Pricking machine, Premier heel	Heeling	July 1903
Pulling machine, Goodyear insole tack	Goodyear	Feb. 1909
Pulling machine, Goodyear upper tack	Goodyear	Nov. 1912

Pulling and resetting machine, Goodyear tack	Goodyear	Nov. 1910
Pulling and trimming machine, insole tack and turn shoe	Goodyear	Dec. 1911
Pulling over machine, model A, Rex	Pulling over	Sept. 1899
Pulling over machine, model B, Rex	Pulling over	July 1910
Pulling over machine, model C, Rex	Pulling over	Mar. 1911
Punching machine, model A, Royal tip	General	May 1911
Quilting machine, Spatter	Metallic	Feb. 1899
Reducing machine, Goodyear outsole channel shank	Goodyear	Apr. 1909
Reducing machine, model H, rotary feather edge and shank	General	Nov. 1904
Reinforcing machine, Economy insole	Goodyear	Sept. 1904
Repairing machine, model A, patent leather	General	Aug. 1912
Rounding machine, Goodyear heel seat	Goodyear	Aug. 1909
Rounding machine, Planet sole, models C and D	General	Nov. 1901
Rounding and channeling machine, Goodyear Universal	Goodyear	Feb. 1899
Rounding and channeling machine, model E, Goodyear Universal	Goodyear	Sept. 1910
Rounding and randing machine, Goodyear heel seat	Goodyear	Jan. 1913
Sanding machine, model AL, tap and sole	Heeling	June 1908
Scarfing machine, model N, tap	General	Sept. 1910
Scalloping machine, model B, top piece	General	May 1905
Scouring machine, model X, heel	General	Nov. 1911
Screw machine, Rapid Standard	Metallic	Feb. 1899
Screw machine, model B, Rapid Standard	Metallic	Jan. 1912
Separating machine, Hadaway Stitch	Goodyear	Feb. 1899
Shoe machine, Goodyear welt and turn	Goodyear	Feb. 1899

Shoe machine, model G, Goodyear welt and turn	Goodyear	Oct. 1908
Shoe machine, model K, Goodyear welt and turn	Goodyear	June 1911
Skiving machine, Amazeen	General	July 1905
Skiving machine, model A, Champion heel lift	General	Sept. 1907
Skiving machine, model A, Champion shank	General	Jan. 1909
Skiving machine, Eros rand	Heeling	Aug. 1906
Skiving machine, Goodyear shank welt	Goodyear	Jan. 1904
Skiving machine, Goodyear Universal shank	Goodyear	Feb. 1899
Skiving machine, Pluma, models C and D	General	Apr. 1909
Skiving and finishing machine, Monarch counter and box toe	Heeling	Jan. 1903
Skiving or Rand splitting machine, model C, Apex tap	General	Jan. 1908
Slashing machine, XX welt	General	Feb. 1911
Slugging machine, Universal	Metallic	Feb. 1899
Snipping machine, Goodyear insole toe	Goodyear	May 1911
Softening machine, toe, models C and D	General	Aug. 1911
Softening machine, toe, model E	General	Apr. 1912
Splitting machine, Empire, models C and D	General	Sept. 1908
Splitting machine, Summit	General	Apr. 1903
Stamping machine, model C, Eagle sole	General	Mar. 1910
Stamping machine, model C, Eagle Upper	General	Mar. 1910
Stamping machine, Regent, models B and C	General	May 1903
Stapling machine, Goodyear upper	Goodyear	Oct. 1910
Stapling machine, model B, Goodyear upper	Goodyear	1912
Sticking machine, model B, Shank piece	General	Sept. 1911

Stitching machine, Economy insole	Goodyear	Oct.	1909
Tacking machine, model A, Grip	Metallic	Feb.	1899
Tacking machine, model B, Grip	Metallic		1909
Tacking machine, No. 1 U. S. M. C. insole	Metallic		1910
Tacking machine, Power welt	Metallic	Feb.	1899
Trimming machine, Goodyear insole heel seat	Goodyear	Jan.	1911
Trimming machine, Goodyear insole heel seat, model B	Goodyear	Oct.	1912
Trimming machine, Goodyear Universal inseam	Goodyear	Feb.	1899
Trimming machine, model B, Rex toe	Pulling over	Oct.	1904
Trimming machine, model A, Rex upper	Pulling over	Dec.	1905
Trimming machine, model H, Rex upper	Pulling over	June	1908
Trimming machine, spring heel	Heeling	Feb.	1899
Trimming machine, Ultima heel	Heeling	Dec.	1904
Turning machine, Gem lip	Goodyear	May	1899
Turning machine, Goodyear forepart	Goodyear	Apr.	1901
Turning machine, Goodyear heel	Goodyear	Apr.	1901
Turning machine, Goodyear lip	Goodyear	Feb.	1899
Turning machine, Goodyear welt edge	Goodyear	Dec.	1901
Turning and slashing machine, Goodyear lip	Goodyear	Jan.	1912
Wheeling machine No. 2, Goodyear impression stitch	Goodyear	June	1908

WELT AND TURN SEWING MACHINES.

Int. 8. What is the function of a welt and turn machine in the manufacture of shoes?

Ans. A welt and turn machine is used to perform two different operations in the manufacture of shoes. In the manufacture of welt shoes it is employed to attach the welt and upper to the insole, and this is its principal use. It is also used to secure together the

upper and sole of a turn shoe. In this operation it sews the upper to the sole while the turn shoe is inside out.

Int. 9. What was the first patent definitely directed to a welt and turn machine of this general character?

Ans. The first patent which I recall, directed to a machine for attaching the welt and upper of a welt shoe to the insole, is patent No. 34,413, February 18, 1862, Destouy. This patent was reissued on September 7, 1869, as No. 3635. A typical claim of the reissue patent is claim 4, which is as follows: —

"4. A sewing mechanism, adapted to units, by machinery, the upper, welt, and sole, substantially as described, so as to produce a machine-made welted boot or shoe."

This Destouy machine was improved by the structure shown in patent No. 93,731, August 17, 1869, Mills, and by the improvements shown in patent No. 170,547, November 30, 1875, Goodyear and Hadley.

The improvements of patent No. 93,731 transformed the machine into a chain-stitch machine, the Destouy machine having been a lockstitch machine. The improvements of patent No. 170,547 reorganized the machine so that it laid the chain on the welt instead of in the channel. A typical claim of the Goodyear and Hadley patent No. 170,547 is the first, which is as follows: —

"1. A sewing mechanism for boots and shoes, in which the channel gauge and back gauge were combined with and arranged relatively to a circularly curved needle, substantially as set forth, so that the operation of sewing therewith places the loop or chain stitch on the outside of the seam, instead of in the channel in the sole."

The machine of this Goodyear and Hadley patent was put into commercial use and was extensively used for some years.

SHOE MACHINE: GOODYEAR WELT AND TURN.

Int. 10. Mr. Chapman has testified that the subjects-matter of certain Letters Patent, namely, No. 412,704, October 8, 1889, to French and Meyer; No. 488,505, December 20, 1892, to LaChapelle, and No. 518,911, April 24, 1894, to Briggs, was embodied in the welt and turn machine illustrated in Complainant's Exhibit

No. 209, which was the welt and turn machine put out by the Goodyear Shoe Machinery Company before February 1, 1899, and by the United Company thereafter. State if there were other patents of the United Company, the subjects-matter of which were embodied in this machine.

Ans. In addition to the patents named by Mr. Chapman, the welt and turn sewing machine as put by the Goodyear Shoe Machinery Company just before February, 1899, and by the United Shoe Machinery Company after that date in 1899, embodied the mechanism shown in the drawings, described in the specification and set forth in the claim of patent No. 561,386, June 2, 1896, French. The mechanism set forth in the claim of this patent comprised means for heating the looper of a welt and turn sewing machine, and the welt and turn sewing machine of 1899, and as put out before and after that date, embodied such means. It was important that a welt and turn sewing machine be provided with means for keeping the looper hot, because if the looper were cold it would chill the wax of the thread as the thread passed through it and would cause the thread to become hard and brittle, thus interfering with the operation of the stitch-forming mechanism and with the setting of the stitch, and causing frequent breakage of the thread. Before such means was incorporated in welt and turn sewing machines frequent difficulty was occasioned in the failure to keep the looper in the proper heated condition. So much difficulty was encountered in this connection with machines as used before the mechanism of this French patent No. 561,386 was incorporated in the machine that the operation of a machine was frequently interfered with seriously by the opening of a window near the machine. I have examined the welt and turn sewing machine No. 228 which was referred to by Mr. Chapman, and which is shown in the photograph Plaintiff's Exhibit No. 232, in the factory of the Commonwealth Shoe & Leather Company at Whitman, Massachusetts, and I find that that machine embodies the means set forth in the claim of this French patent No. 561,386, June 2, 1896.

Int. 11. State whether or not the Goodyear welt and turn machine of 1899 has continued to be the standard machine of the

United Company. If not, what machines have since been designed and put into use? What were their relations to the machine of 1899? When were they put into use? And if they embodied the subject-matter of any Letters Patent of the United Company, name the patents. State also to what extent, if at all, these new machines were an advancement in the art.

SEWING MACHINE: GOODYEAR UNIVERSAL INSEAM.

Ans. Just before the formation of the United Shoe Machinery Company in February, 1899, the Goodyear Shoe Machinery Com pany had been experimenting with a view to producing a lock-stitch welt-sewing machine. About that time shoe manufacturers thought they desired to attach the upper and welt of welt shoes to the insole by a machine which would sew with a lockstitch instead of the chainstitch of the welt and turn sewing machine of 1899. In recognition of this desire on the part of shoe manufacturers and in order to satisfy it the United Company continued the experimental work which had been begun by the Goodyear Shoe Machinery Company looking toward the production of a lockstitch welt-sewing machine, and in June, 1899, first put out for commercial use the machine which had been produced as the result of that experimenting.

That machine was known officially as "Sewing Machine Goodyear Universal Inseam". I might add that the reason why manufacturers at that time thought that they preferred to attach the welt and upper on a lockstitch sewing machine was that the stitch which is made by a lockstitch machine more nearly resembles the stitch which is made by the hand workman in sewing the welt and upper to the insole.

This lockstitch welt-sewing machine as first put out in June, 1899, embodied mechanisms shown in the drawings, described in the specifications and set out in the claims of the following patents, all owned or controlled by the United Shoe Machinery Company: —

No. 366,935, July 19, 1887, Dancel.

No. 412,703, October 8, 1889, French and Meyer.

No. 495,452, April 11, 1893, Cole.

No. 583,522, June 1, 1897, Warren.

No. 705,063, July 22, 1902, French and Meyer (application filed October 14, 1897).

No. 790,790, May 23, 1905, French and Meyer (application filed December 6, 1898).

No. 732,729, July 7, 1903, French and Meyer (application filed December 21, 1898).

No. 705,062, July 22, 1902, French and Meyer (application filed November 23, 1899).

In 1900 improvements were incorporated in the machine which are shown in the drawings, described in the specifications and set forth in the claim of patents —

No. 781,596, January 31, 1905, French and Meyer (application filed March 10, 1900).

No. 1,030,742, June 25, 1912, Meyer (application filed June 16, 1902).

Manufacturers of shoes did not use this lockstitch sewing machine long before they discovered that they did not, after all, wish to attach the welt and upper of a welt shoe by means of a lockstitch sewing machine. They found that it was impossible to secure the tight inseam, which is indispensable in the inseam of a welt shoe. Only seventy-three of these machines were put in use by shoe manufacturers.

After the failure of the lockstitch welting machine the United Shoe Machinery Company concentrated its efforts upon experiments which were already under way looking toward the production of a high-speed chainstitch welting maching. The inventors who were working upon this experimental machine believed that the machine which they had in mind would be capable of a much higher speed than the welt and turn sewing machine which was then the standard welt sewing machine; that is, the same machine which was being put out in February, 1899.

It was also believed that the organizations which the inventors had in mind would enable a machine constructed upon those lines to sew the welt and upper to an insole much thinner and lighter

than insoles which had to be used with the commercial machine at that time; that is, the 1899 machine.

The difference in expense between such an insole as was required by the 1899 machine, and the light, thin insole which it was anticipated could be handled by the proposed new machine, would have effected a substantial economy without any sacrifice in the quality of the shoe.

The experimental work to which I have referred was carried on very aggressively, and finally a commercial machine was produced and was first supplied to manufacturers in July, 1902, the machine being known officially as "Shoe Machine, Goodyear Welt and Turn, Model E".

SHOE MACHINE — MODEL E, GOODYEAR WELT AND TURN.

When the machine was put out, it incorporated mechanisms shown in the drawings, described in the specifications and set forth in the claims of the following patents, all owned or controlled by the United Shoe Machinery Company: —

No. 461,793, October 20, 1891, Briggs.

No. 488,505, December 20, 1892, LaChapelle.

No. 507,873, October 31, 1893, Arnold.

No. 884,537, October 15, 1901, Briggs.

No. 884,538, October 15, 1901, Briggs.

No. 687,719, December 3, 1901, Briggs.

No. 679,409, July 30, 1901, Alley.

The machine as first put out also embodied mechanisms which were set forth in the claims of applications which were then pending, upon which were subsequently granted the following patents:

No. 732,729, July 7, 1903, French and Meyer.

No. 1,030,742, June 25, 1912, Meyer (application filed June 16, 1902).

As I have stated, it was confidently anticipated that this new machine, which I shall for convenience refer to as the "model E" machine, could be run at much higher speed than the 1899 welt and turn sewing machine. This expectation, however, was not realized, and it was found that the machine could not be run under commer-

cial conditions at a speed above 375 stitches per minute, which was the normal commercial speed of the welt and turn sewing machine of 1899.

Furthermore, the expectations as to the value of the organizations which enabled the model E machine to operate upon shoes provided with lighter insoles were not realized as expected, because although the machine was capable of effecting that economy, reinforced insoles about this time were used largely in increasing numbers, so that the advantages of this model E machine in that connection were practically nullified by this great increase in the use of reinforced insoles, and the consequent disappearance of the field in which these advantages of the model E machine would have been realized.

Accordingly, the model E machine never superseded the welt and turn machine of 1899; a large number of the model E machines were put out, and it continued to be put out together with the old machine, that is, the 1899 machine, up to the time when the new welt and turn sewing machine, known as model G, was produced and put out for commercial use in 1908.

As I have stated, the expectations of the officials and experts of the United Company, as to the higher speed at which model E machine might be operated, were disappointed, although substantial progress was made in the model E machine toward the development of organizations which by themselves were capable of operation at much higher speed than the corresponding organizations of the 1899 machines.

In view of the failure to produce a high-speed machine in the model E machine, the officials of the United Company, as early as 1904, started several inventors on experimental work with the primary object of producing a high-speed welt and turn sewing machine on entirely different lines from those on which the welt and turn machine of 1899 was constructed. This experimental work was carried on steadily, several machines were constructed, one after another, were successively tried out and in turn abandoned. Finally, in 1906, two of the inventors who were engaged in this experimental work had produced machines which were so promis-

ing that they were both given extended experimental trials in shoe factories, under commercial conditions.

Finally, the two machines were tried out in the same shoe factory, side by side, and were run for a number of months on regular work in that factory. During this period they were under constant observation by experts of the United Company, with a view to determining which of the machines should be adopted for commercial use. Finally, the machine which was eventually developed into commercial form and known as model G machine was commercially adopted, having incorporated in it some of the valuable features of the other experimental machine.

SHOE MACHINE — MODEL G: GOODYEAR WELT AND TURN.

This machine was put into commercial use in October, 1908, and was known officially as "Shoe Machine, Goodyear Welt and Turn, Model G".

The machine was run regularly in the manufacture of shoes at a speed of 500 stitches per minute, as compared with the speed of 375 stitches per minute of the old welt and turn machine, that is, the machine of 1899. This speed of 375 for the machine of 1899 was the highest speed at which it was practicable to run that machine regularly under commercial conditions. Above that speed the machine occasionally missed a stitch, and, furthermore, it was so organized that a speed in excess of 375 would cause excessive wear of the machine and it would not stand up under constant use at a higher speed.

In the production of a high-speed welt and turn sewing machine, the inventors of the United Shoe Machinery Company encountered many serious problems. One of these problems had to do with a mechanism for putting the proper tension on the thread. It developed in the experimental work that when such a machine was run at a low speed the tension mechanism must offer a greater resistance than when the machine is run at a high speed. This was due to the inertia of the tension mechanism, which caused it to offer a greater resistance to the quicker pull on the thread which was exerted when the machine was run at a high speed. If the mech-

anism was so adjusted that it offered the same resistance as for low speed, the quicker pull on the thread at high speed would frequently break the thread. This problem was serious because it is frequently necessary in the operation of the welt and turn machine to run the machine more slowly on certain parts of the work, as in going around a narrow toe. This problem was overcome by incorporating in this new model G machine the tension mechanism which automatically offered a greater resistance to the pull of the thread at the slower speed, and a less resistance to the pull of the thread at higher speeds.

This mechanism is described in broad terms in patent No. 1,030,816, June 25, 1912, Holmes. Claim 1 of this patent is as follows:—

"In a sewing machine the combination with means offering and yielding resistance against which the stitch is set, of mechanism for varying such resistance when the speed of operation is varied, during the continued operation of the machine in sewing a seam."

The commercial construction of this mechanism was substantially as shown in the drawings of patent No. 1,030,743, June 25, 1912, Meyer, except that the mechanism was arranged at the back of the machine instead of at the front of the machine as shown in the drawings of this Meyer patent. Most of the claims of this patent No. 1,030,743, which was granted on an application filed September 1, 1909, set forth the mechanism to which I am referring.

A typical claim of the claims of this patent which are directed to this mechanism is the first, which is as follows:—

"1. A sewing machine, having, in combination, stitch forming devices, and means responsive to variations in the speed of the machine operating during the continued operation of the machine in sewing a seam to vary the tension on the thread when the speed of the machine varies."

Combined with this mechanism for automatically varying the resistance of the tension mechanism according to the speed of the machine, was a mechanism for varying the amount of this resistance at the different points in the cycle of the machine's operations in accordance with the requirements of the stitch-forming mechanism at successive stages in the cycle of the machine's operation.

Patent No. 1,030,743, June 25, 1912, which, as I have explained, disclosed substantially the automatic tension mechanism, also shows the double tension mechanism to which I am now referring, substantially as that mechanism was embodied in the commercial machine. And this mechanism is set forth in several claims in that patent. This mechanism is also set forth in broader terms in the claims of patent No. 1,028,474, June 4, 1912, Mayo (application filed November 22, 1909). A typical claim of this patent is No. 13:

"13. A chain stitch sewing machine, having, in combination, stitch forming devices including a take-up acting while the needle is in the work, a tension device, means for actuating said devices to exert a relatively light tension on the thread during the loop-drawing stroke of the needle, and a relatively heavy tension on the thread during the stitch-setting stroke of the take-up, means for simultaneously adjusting the amount of both tensions and means for adjusting the amount of one tension independently of the other."

This mechanism was also set forth in even broader terms in the claims of patent No. 1,017,440, February 13, 1912, Meyer (application filed November 4, 1904).

The fourth claim of this patent was as follows: —

"4. A chain stitch, shoe sewing machine, having, in combination, a needle, a looper, a stitch-setting take-up, a tension device operating to exert a uniform and relatively light tension upon the thread during the retracting stroke of the needle, and an increased tension during the setting of the stitch, and means for adjusting the tension device to vary the amount of increase in the tension without affecting the uniform and relatively light tension exerted thereby on the thread during the retracting stroke of the needle, substantially as described."

Another problem which had to be solved in the development of a high-speed welt and turn sewing machine was the production of such an organization, including the looper and means for actuating it, that in the operation of the machine at high speed the looper would never fail to supply the needle with thread. In the 1899 machine, as I have already explained, the looper would occasionally fail to supply thread to the needle when the machine was run at a speed in excess of 375 stitches per minute. The organization

of the model G machine has never failed to supply thread at any speed at which the machine has been run, and, as I have explained, the regular commercial speed of that machine is 500 stitches per minute. No patents have as yet been granted showing this organization of the model G machine.

Another defect of the old welt and turn machine, that is, the 1899 machine, was that the needle guide which must be so operated that it shall be down close to the stock while the needle is penetrating the stock, to afford proper support for the needle, would fail to operate properly at higher speeds. This was due to the fact that the 1899 machine was so organized that the needle guide was moved downwardly into its needle-supporting position by a spring, and if a lump of wax got on the needle, as would frequently happen, it would prevent the needle guide moving down into its proper needle-supporting position. Of course, if it were otherwise possible to run the 1899 machine at a higher speed than 375, the difficulty to which I have referred would increase out of all proportion to the speed of the machine, since the defects of this spring actuation of the needle guide would manifest themselves much more frequently at a higher speed.

The improvement on this mechanism in the model G machine, which, while an important improvement for such a machine whatever its speed, was of marked value in the high-speed machine, is not disclosed in any patent which has as yet been granted.

Another improvement in this model G machine to which I will direct attention is the organization permitting a yielding of the needle during the feeding of the stock. This improvement manifests its utility chiefly when the stock is being fed around sharply curved lines, as around the toe. The commercial form of this mechanism is not disclosed in any patent which has, as yet, been granted, but the mechanism is set forth in broad terms in the claims of —

Patent No. 935,726, October 5, 1909, Alley, and

No. 1,030,867, July 2, 1912, Briggs (application filed January 20, 1903).

This new machine of 1908, to which I have referred as the model

G machine, embodied many other improvements in addition to those to which I have specifically referred, many of which improvements are not yet disclosed in any granted patents.

The patents which do set forth mechanisms embodied in this machine are the following: —

No. 634,850, October 10, 1899, Fowler and Warren.
No. 666,823, January 29, 1901, Selby.
No. 835,513, November 13, 1906, Fuller.
No. 935,726, October 5, 1909, Alley.
No. 1,003,175, September 12, 1911, Eppler.
No. 1,005,181, October 10, 1911, Eppler.
No. 1,015,304, January 23, 1912, Eppler.
No. 1,015,772, January 30, 1912, Ashworth.
No. 1,017,059, February 13, 1912, McPherson and Orr.
No. 1,017,440, February 13, 1912, Meyer.
No. 1,023,071, April 9, 1912, Eppler.
No. 1,028,474, June 4, 1912, Mayo.
No. 1,030,742, June 25, 1912, Meyer.
No. 1,030,743, June 25, 1912, Meyer.
No. 1,030,816, June 25, 1912, Holmes.
No. 1,030,867, July 2, 1912, Briggs.

As to the advantages of the model G welt and turn machine over the welt and turn machine of 1899, it was run, as I have already explained, at a speed of 500, as compared with a maximum speed under commercial conditions of 375 for the 1899 machine. This increased speed, together with features of the organization of the model G machine which made its operation more convenient for the workman, gave the model G machine a capacity of a little over eight per cent more than the capacity of the 1899 machine. This model G machine was very favorably received by shoe manufacturers and over 1400 of these machines were put into shoe factories. The United Company was always behind in its orders. For example, for eight consecutive months, beginning December 1, 1910, the company was at all times more than 200 machines behind in filling its orders for the model G machines.

SHOE MACHINE — MODEL K: GOODYEAR WELT AND TURN.

This model G machine, or, to quote its official title, "Shoe Machine, Goodyear Welt and Turn, Model G", is not the present standard commercial machine of the United Shoe Machinery Company, for it was superseded in June, 1911, by still another improved machine, known officially as "Shoe Machine, Goodyear Welt and Turn, Model K". I shall, for convenience, refer to this machine as model K.

This new model K machine is substantially the same as the model G machine, with the incorporation in the organization of that machine of the valuable improvements which were acquired by the United Shoe Machinery Company from Thomas G. Plant in September, 1910.

In explanation of one of the most important of the improvements, in the use of the welt and turn sewing machine of 1899 and also in the use of the model G machine in 1908, it was necessary for the operator at the beginning of the sewing operation to hold with his finger the end of the welting. As the operator always took good care to keep his finger out of the way of the needle and awl, a substantial piece of the welting was always wasted in the operation of the 1899 and model G machines owing to this requirement in the operation of those machines.

When the operator had finished the welt sewing operation on each machine, he had to hold the shoe away from the machine and cut off the welting on the shoe from the supply of welting in the machine by means of a hand knife.

Thomas G. Plant was the first in the history of shoe machinery to provide a welt and turn sewing machine adapted for commercial use in the manufacture of shoes with an organization which held the end of the welting close to the point at which the stitch was to be formed and which at the completion of the welt sewing operation severed the welt close to the point where the last stitch had been formed.

Organized with this mechanism in the welt and turn sewing machine as constructed by Plant was the mechanism which automati-

cally prevented the operator from pulling too much of the welting away from the machine. As I have stated, in the operation of the 1899 and model G machines the operator had to pull a considerable length of welting from the machine in order to get the shoe into position where he could conveniently sever from the main supply of welting that portion of welting which had been secured to the shoe. The welt holding and cutting organization which Plant used in his machines did not, of course, require that this excess of welting should be pulled away from the machine, but his organization of welt-measuring mechanism effectively prevented the operator from pulling away too much welting through carelessness or for other reasons. An advantage of such mechanism in any machine is that after the operator has pulled out an excess length of welting he must, before he begins the sewing operation on the next shoe, pull the welting back into the machine, so that too much will not be presented and wasted at the beginning of the next stitch. The danger is that he is likely not to pull it back far enough into the machine, so that even more will be wasted than he needs, in order to hold the welting with his finger in the manner which I have described.

The advantages of the mechanism of the Plant machine, including these improvements, are very important in the saving of manual operations and in effecting a substantial saving in welting.

Immediately after the acquisition of the patents of Thomas G. Plant by the United Shoe Machinery Company in 1910 some four or five inventors were put to work by the United Company to adapt the Plant improvements for the model G welt and turn sewing machine, which was at that time the standard commercial machine of the United Company. In the reorganization of these mechanisms, which was necessary to adapt them for the model G machine, the United Company inventors made important improvements upon them so that as finally incorporated in the model G machine which, embodying these improvements, and others to which I shall refer, became known as model K machine, improvements were made which represent almost as important advances in the industry as did the Plant improvements. In operating the Plant welt holder

and cutter it was necessary for the operator to step up on a treadle at the time when he desired to sever the welt. In the model K machine it is only necessary for the operator to move the shoe slightly to the left, from the stitch-forming position into the path of the welt holding and cutting mechanism, and that mechanism is automatically and instantly moved forward into operative position by mechanism actuated by the slight pull on the welt which is effected in the movement of the shoe into welt-cutting position. In this quick forward movement of the welt holder and cutter it grips the welt and severs it close to the end of the line of stitches. The welt holder remains in this forward position, holding the end of the welt for the next shoe. In the operation of sewing the welt upon the next shoe, the end of the welt is held by the welt holder in this position close to the point where the first stitch is to be made. The holder remains in this forward position until the completion of the first stitch, when it is automatically retracted into a position where it is entirely out of the way of the shoe during the various positions in which the operator has to hold the shoe during the stitching operation.

I produce two shoes which illustrate the advantages of these improvements. One of these shows a shoe which had its welt attached on the old welt and turn machine, that is, the machine of 1899. It will be observed that on one side of the shoe, the side where the sewing operation began, there is a considerable length of welting which is wasted, and which extends beyond the line of stitching and must later be cut off and thrown away. This was the piece of welting which was held by the finger of the operator at the beginning of the machine's operation.

[*Shoe having welt attached by welt and turn machine of 1899 is marked "Defendants' Exhibit 106".*]

[*Answer to Int. 11 continued:*]

The other shoe which I produce had its welt attached on the present standard commercial machine of the United Company, the model K machine. It will be observed that the piece of welting on each side which extends beyond the line of stitching is short and of substantially the same length on each side. The amount of

welting saved on this shoe may be observed by comparing it with the long piece at the end of the welting beyond the line of stitching, on one side of the other shoe which I produced. That saving is approximately one inch on each shoe.

[*Shoe having welt attached on defendants' present commercial welt and turn machine, model K, is marked "Defendants' Exhibit 107".*]

[*Answer to Int. 11 continued:*]

The construction of these welt-holding, welt-cutting and welt-measuring improvements in the model K machine is not shown in any patents as yet granted, but these constructions are set forth in broad terms in patents —

No. 700,279, May 20, 1902, Winkley.

No. 877,858, January 28, 1908, Plant.

No. 877,859, January 28, 1908, Plant.

And an experimental stage in the development of the welt-measuring improvements is shown in patent No. 1,071,050, August 25, 1913, Holmes.

The typical claims of the Winkley patent No. 700,279, May 20, 1902, are the following: —

"1. A welt sewing machine, having, in combination, stitch forming mechanism, a welt guide, and a welt holder constructed and arranged to hold the end of the welt in contact with the upper, substantially as described."

"6. A welt sewing machine, having, in combination, stitch forming mechanism including a needle, a welt guide on one side of the needle, and a welt holder on the opposite side of the needle, substantially as described."

Claim 2 of Plant patent No. 877,858, January 28, 1908, is as follows: —

"2. In a boot and shoe sewing machine, the combination with stitch forming devices and means for guiding a boot or shoe in proper relation thereto for the stitching operations, of a welt guide, and welt severing and holding means whereby the welt may be severed and the welt strip held for the next stitching operation."

Claims No. 1 and 11 of Plant patent No. 877,859 are as follows: —

"1. In a welt attaching machine, a welt measuring device comprising stopping means for limiting the withdrawal of the welt upon withdrawal of the work from the machine."

"11. A sewing machine comprising stitch forming mechanism, welt severing means at one side thereof, and welt measuring means at the opposite side thereof, and means to operate the same."

Claim 15 of Holmes patent No. 1,071,050 is as follows: —

"A sewing machine having in combination a welt guide, a welt controlling device, movable with a welt as it is drawn forward, and means for connecting the device with the welt in bringing the machine into position for the removal of the shoe substantially as described."

By way of introduction to my discussion of the next important improvement which was set forth in the patents acquired from Plant, I will explain that in the operation of the model G welt and turn machine, as well as in the operation of the welt and turn machine of February, 1899, when the operation of the machine had been completed, and the machine had come to rest, the needle held in its hook the last loop formed, and before the shoe could be freed from the machine it was necessary for the operator to turn the machine back, advancing the needle so as to cast off this last loop from the hook of the needle. The operator had then to serve the thread with a hand knife.

Furthermore, neither of these machines, that is, the machine of 1899 and the model G machine, was provided with mechanism for stopping the machine.

It was accordingly necessary for the operator, as he approached the end of the stitching operation, to place his hand upon the belt pulley at the left of the machine, slow up the machine, stop it with his hand and then turn the machine back so as to bring the needle forward into position to cast off the loop.

In the welt-sewing machine as constructed by Plant there was incorporated for the first time mechanism for automatically stopping and reversing a welt-sewing machine and by the reversing movement casting off the last loop held by the needle.

This improvement is set forth in broad terms in patent —

No. 1,018,130, Plant, of February 20, 1912.

A typical claim of this patent is the first, as follows: —

"1. A chain stitch inseam shoe sewing machine, having, in combination, stitch forming devices including a curved hooked needle

and a looper and means, acting automatically upon stopping the machine, to free the last needle loop from the stitch forming devices and bring the needle to rest out of engagement with the work."

The mechanism which Plant used in his welt and turn machine for automatically stopping the machine and turning it back to free the last loop from the needle, was a very unsatisfactory mechanical organization, as it did not always act reliably and was subject to frequent breakage. The inventors who, as I have stated, were set to work to improve this Plant mechanism devised for the model K machine a radically different mechanism for stopping and turning back the machine to release the shoe from the machine by casting off the last loop from the needle. These improvements made by the United Shoe Machinery Company inventors are not yet shown in any granted patents.

Mr. WEBSTER. I would like to interpose an objection, before we start. Counsel for petitioner objects to statements by the witness heretofore made or that may be made hereafter with reference to what others said, thought or believed, as being mere hearsay. Counsel for petitioner also objects to the introduction of any evidence relating to mechanisms not shown and described in patents and referred to in claims of patents issued prior to the filing of the petition in this cause, both said objections being based on the ground that the same is immaterial, inadmissible and not competent in any respect.

Counsel for petitioner moves to strike out all such objectionable testimony heretofore introduced and gives notice that at the proper time hereafter a formal motion to strike out will, as he is at present advised, be made so as to formally bring the matter to the attention of the court.

[*Answer to Int. 11 continued:*]

Another important improvement set forth in patents acquired by the United Shoe Machinery Company from Plant was an improved welt-guide mechanism. In the 1899 machine the welt-guide moved from its rearward position which it took at each operation of the machine, to permit the feed of the welt directly into welt-presenting position.

It was not practicable in that organization to move the welt-guide closely into contact with the shoe because when the materials increased in thickness the welt-guide would press the shoe away from the path of the needle, so that the stitch would not be properly formed. The result was that it was the practice in the use of the old machine to adjust the welt-guide mechanism so that the welt-guide did not advance quite to the shoe. Consequently the welt-guide did not afford to the operator any substantial support against the backward movement of the needle at that time in frictional engagement with the stock and tending to pull the stock back with it, nor did the welt-guide assist the operator in resisting the thrust of the awl.

The Plant welt-guide mechanism is shown and set forth in the claims of reissued patent No. 13,374, reissued February 27, 1912, Plant (original patent No. 947,401, January 25, 1910).

In the mechanism set forth in this patent the welt-guide in its forward movement after the feed of the stock, at each operation of the machine, was first moved yieldingly into position to present the welt properly for the stitch-forming operation. Then, after the needle had entered the welt, the welt-guide was moved further forward, still yieldingly to press together the layers of material, and finally on completion of the forward movement of the needle the welt-guide was locked in its most advanced position, thus holding the layers of stock firmly pressed together and affording the needed assistance to the operator in resisting the frictional pull on the materials during the backward stroke of the needle and the following stroke of the awl in the same direction.

A typical claim of reissued patent No. 13,374 is 48 : —

"48. A sewing machine containing stitch forming mechanism including a needle, and feed mechanism, combined with a back gauge having movement toward and from the work, and means for moving the back gauge forward into substantial contact with the work in advance of the needle to approximately position the work and completing its forward movement after the needle has penetrated the work."

The "back gauge" of this claim is the part that I have above designated as the "welt-guide". The welt-guide performs a double

function of presenting the welt in position for attachment to the shoe and serving as a back gauge in the manner which I have described.

All of the improvements in welt and turn sewing machines which were set forth in patents acquired by the United Company from Plant were, as I have indicated in discussing some of them, substantially improved by inventors of the United Company before they were introduced into the organization of the model G machine, the machine of 1908, to produce the present commercial machine, the model K machine. These improvements by the United Company inventors are for the most part not yet shown in granted patents.

I should further explain that, while these Plant improvements were very valuable, as I have endeavored to explain, the Plant welt and turn sewing machine to which they were applied was a machine constructed substantially on the lines of the United Company's 1899 machine and was, in fact, not so satisfactory a machine as was the United Company's 1899 machine.

The utility of these Plant improvements manifested itself to a much greater degree when the improvements were incorporated in a high-speed machine and the value of the improvements increased out of proportion to the increase in the speed of the machine on which they were used. It was not, therefore, until these improvements were incorporated in the high-speed model G machine of the United Company that the advantages and utility of the improvements were fully realized.

The patents which have so far been granted on improvements embodied in the model K machine, including those embodied in the model G machine, except some of the improvements which were in the model G machine which were superseded by the improved mechanisms of the model K machine, are as follows: —

No. 666,823, January 29, 1901, Selby.

No. 700,279, May 20, 1902, Winkley.

No. 1,017,440, February 13, 1912, Meyer (application filed November 4, 1904).

No. 1,018,130, February 20, 1912, Plant (application filed June 6, 1911).

No. 1,023,071, April 9, 1912, Eppler (application filed November 22, 1909).

No. 1,028,474, June 4, 1912, Mayo (application filed November 22, 1909).

No. 1,030,742, June 25, 1912, Meyer (renewed application filed December 9, 1904).

No. 1,030,816, June 25, 1912, Holmes (application filed May 22, 1909).

No. 1,030,867, July 2, 1912, Briggs (application filed January 20, 1903).

No. 1,048,511, December 31, 1912, Eaton (application filed December 5, 1907).

No. 1,071,050, August 26, 1913, Holmes (application filed August 30, 1909).

No. 1,071,435, August 26, 1913, King (application filed March 7, 1912).

The commercial advantages of the model K machine over the welt and turn machine of 1899 and over the model G machine of 1908 were striking. The model K machine was regularly run in shoe factories at the same speed as the model G machine; that is,

500 stitches per minute as compared with the speed of 375 stitches per minute of the 1899 machine; but the model K machine had a capacity of about six per cent over that of the model G machine and about fifteen per cent over that of the 1899 machine. This increase in capacity over both the 1899 machine and the immediate predecessor of the model K machine was due to two important advantages secured by the organization of model K machine. First, the improvements to which I have briefly referred saved a great deal of the time of the operator; and, second, those improvements facilitated the work of the operator in running the machine.

The result was that the time when the 1899 machine or the model G machine was idle was greatly reduced by the improvements of the model K machine, the present commercial machine, so that the machine was operating more of the time, and accordingly had increased the capacity. Of course, the increased speed which the model K machine had, like the model G machine, contributed substantially to the capacity of the model K machine as compared with the 1899 machine.

A further distinct improvement in the industry affected by the improvements incorporated in the model K machine was the substantial saving afforded to the manufacturer in the cost of his welting.

I have already explained how about an inch of welting is saved upon each shoe. This saving amounts to at least a quarter of a cent per pair of shoes, and is greater on men's shoes. This saving amounts in the aggregate to many thousands of dollars in a shoe factory of medium size.

All of these advantages resulted in a very favorable reception by shoe manufacturers of the model K machine immediately after it was offered to them. The first machine, as I have stated, was put out in June, 1911, but the company was not able to build them and put them out in substantial numbers before November, 1911. In the period between November 1, 1911, and September 1, 1913, 912 of these model K welt and turn machines were put into shoe factories. The company has always been behind in its orders for these machines. For example, on March 1, 1913, at the end of

the last fiscal year, the company was 197 machines behind in filling its orders.

Int. 12. If you have not already answered this question, I would like to have you answer it now: To what extent have these two types of machines, namely, models G and K, been put into use by the United Company?

Ans. Over 1400 of the model G machines were put into shoe factories, and, as I have just stated, up to September 1, 1913, 912 of the model K machines have been put into shoe factories.

Int. 13. Will you state the number of machines of models K and G type, also the old type, leased by the United Company during the last fiscal year?

Ans. During the last fiscal year of the company, ending March 1, 1913, six of the old machines, that is, the machine of 1899, were shipped; fifty-four of the model G machines, and 497 of the model K machines.

Int. 14. Reference was made by Mr. Chapman to Briggs patent 461,793, dated October 20, 1891. State, if you know, what change was required in the organization of a welt-sewing machine to enable it to perform the Briggs method.

[*By* Mr. WEBSTER. *Objected to as immaterial.*]

Ans. To adapt a welt and turn sewing machine to the practice of the method set forth in the claim of the Briggs patent No. 461,793, October 20, 1891, no change was necessary in the organization of such a machine. It was only necessary to provide the machine with a take-up and a thread finger, and both take-up and thread finger were old before the date of the Briggs invention in lock-stitch sewing machines. They are both disclosed in patent No. 253,156, January 31, 1882, Campbell. The welt and turn sewing machine of the Goodyear Shoe Machinery Company, that is, the standard commercial machine of the United Company in 1899, was held to infringe this Campbell patent No. 253,156. The decision of the court is reported in 47 Fed. Rep. page 118.

Int. 15. Did the United Company machine that you have just spoken of in your last answer practice the Briggs method?

Ans. Yes, sir.

Int. 16. Mr. Chapman has referred to patent to Stickel No. 296,084, dated April 1, 1884, disclosing a method of forming a chainstitch as anticipatiag the single claim of Briggs patent 461,-793, of October 20, 1891. What have you to say as to the correctness of Mr. Chapman's conclusion in this matter? Please note that this question is asked *de bene esse*, we having objected to the question put to Mr. Chapman and answered by him on the same subject.

Ans. I am of the opinion that Mr. Chapman was absolutely incorrect in his conclusions that the method set forth in the claim of Briggs patent No. 461,793, October 20, 1891, was disclosed in patent No. 296,084, April 1, 1884, Stickel. In my opinion, there is absolutely no suggestion in the Stickel patent of the method set forth in the single claim of the Briggs patent. The most important, and, in my opinion, a conclusive reason why the Stickel patent does not disclose the Briggs method is that it fails to suggest even an essential step in the Briggs method as defined in the claim of the Briggs patent; that is:—

"Passing the second loop made from the supply thread through the second hole in the materials and through the drawn down loop," . . .

This step of the Briggs method is well illustrated in Figs. 5 and 6 of the drawings of the Briggs patent. The Stickel patent fails absolutely to disclose this essential step of the Briggs method because, as stated in line 15 of page 2 of the Stickel specification:

"the thread is kept taut" . . .

and in lines 20 to 26, page 2, of the Stickel specification:—

"the tension on the previous stitch will be constantly kept taut (see Fig. 6) until the needle, with loop-holder and finger, has been drawn backward far enough so as to cause the loop of thread to slip off from the finger and to be drawn through the hole, as seen in Fig. 7."

As I understand these statements in that Stickel specification, the free end of the thread represented at G is kept under constant tension from the position of the tools represented in Fig. 5 through the position shown in Fig. 6 to the position illustrated in Fig. 7.

This being the case, it is obvious that at the moment the short loop shown in Fig. 6 is released from the spring finger, the thread in the loop will immediately be taken up by the tension. So that in passing through the stock from the position shown in Fig. 6 to the position shown in Fig. 7 the needle must form its own loop just as a needle in all chainstitch sewing machines in use at the time of the application for the Stickel patent had to form its own loop. It seems obvious, therefore, that there is no suggestion in this Stickel patent of the essential step of the method defined in the claim of the Briggs patent to which I have referred; th· is:—

"passing the second loop made from the supply thread through the second hole in the materials and through the drawn down loop," . . .

I call attention further to the fact that in the use of the Stickel tool there must necessarily be a very objectionable rendering of the thread, or see-sawing action of the thread through the hook of the needle which it was an object of the Briggs method to overcome. First, there must be a rendering of the thread through the hook of the needle in the change from the relative positions of the needle, hook and thread shown in Fig. 5 to the relative positions shown in Fig. 6. That there must be this rendering is clear from the statement in lines 17 to 20 on page 2 of the Stickel specification as follows:—

"Then the tool is drawn back, the tension of the loop thereby increasing and swinging the movable finger inward toward the hook."

This rendering of the thread through the hook of the needle is, of course, in the direction of the tension. Again, there must be a rendering of the thread through the hook of the needle in the opposite direction, in the progress of the needle from the position shown in Fig. 6 to that shown in Fig. 7. As I have explained, the instant that the thread is released by the spring finger, which release immediately follows the position of the part shown in Fig. 6, the thread which is in the small loop shown in Fig. 6 is immediately taken up by the tension. Accordingly what loop there was is now gone and the needle must form its own loop in passing through the materials and in moving to the position shown in Fig. 7. Furthermore, it

must be clear that even if I am incorrect in my view that according to the method of the Stickel specification the small loop shown in Fig. 6 is taken up by the tension immediately upon its release by the spring finger, it cannot be denied that the loop shown in Fig. 6 is less than half the size of the loop shown in Fig. 7, and it is certainly obvious that the loop shown in Fig. 7 cannot be produced without substantial rendering of the thread through the hook of the needle.

Another reason, which to my mind is alone conclusive, of the failure of the Stickel patent to disclose the method of the Briggs patent is that there is no suggestion in the Stickel patent of any effect whatever being produced upon the preceding stitch. The object of the method defined in the claim of the Briggs patent is to set the preceding stitch, not the stitch which is being formed. This is clear from the statement on page 2 of the specifications of the Briggs patent, in lines 93 to 99, as follows: —

"If now the supply thread *t* be pulled taut in the direction of the arrow, as shown in Fig. 7, the loop *h*' will be drawn tight about the instrument and laid against the surface of the material *b* preparatory to forming the third stitch, and at the same time the first stitch will be set."

Again, quoting from lines 66 to 70 on page 2 of the Briggs specification: —

"The supply thread *t* is represented as pulled taut in the direction of the arrow, the second loop *h*' as tightened around the instrument and laid against the material *b* and the first stitch *b* as set."

The change effected by the movement of the Stickel tool from the position represented in Fig. 4 to that represented in Fig. 5 is simply a tightening of the loop around the needle. There is no suggestion anywhere in the Stickel specification that any effect whatever is produced upon the preceding stitch by the transition from the position of the tool shown in Fig. 4 to that shown in Fig. 5, nor indeed is there anywhere on the Stickel specification a suggestion that Stickel sets the preceding stitch or any stitch in any way whatsoever.

The expression "previous stitch" in line 70 on page 1 of the

Stickel specification, and line 16 of page 2 of the Stickel specification, obviously, in view of the context, must mean the stitch being formed at the time, which comprises the loop then around the shank of the needle.

As I have stated, there is nothing in the Stickel specification to suggest that he intended or contemplated setting the stitch in any manner whatsoever, and much less is there any suggestion that he contemplated setting the stitch in any other manner than that which was the only way known at the time of the application for his patent; that is, by the needle, and by the needle alone, with the attendant rendering of the thread through the hook of the needle, which it was an object of the Briggs method to obviate.

Mr. Chapman attempted to support a hypothetical method of operation which he set up for the Stickel method by appealing to the knowledge of the "man skilled in the art". The conclusive answer to Mr. Chapman's statement in this connection is that at the date of the application for the Stickel patent, December 15, 1883, the Briggs method, as defined in the claim of the Briggs patent, had not been invented. The only way to set a stitch in a chain-stitch sewing machine which at that date was known to the man skilled in the art was the setting of the stitch by means of the needle, as it was done universally by all chain-stitch sewing machines at that time.

I should like to add that I never heard of the Stickel patent until it was mentioned by Mr. Chapman in his testimony, and it has never in any way been mentioned in connection with any litigation involving the Briggs patent No. 461,793.

Mr. CHOATE. This question is also asked *de bene esse* on the same ground that we objected to the subject-matter of it in Mr. Chapman's examination:

Int. 17. Mr. Chapman has asserted the identity of the subject-matter of claims 4 and 5 of British patent 13,366 of 1888 to French and Meyer with the Briggs method as defined in the single claim of the Briggs patent. State briefly what is your view of the accuracy of Mr. Chapman's conclusion.

Ans. I am forced to the conclusion that in taking this position

Mr. Chapman has failed to understand the Briggs method as set forth in the claim of Briggs patent 461,793. That method is a method of forming chain stitches. The method defined in claims 4 and 5 of British patent No. 13,366 in 1888 is a particular method to be practiced in the manufacture of boots and shoes, and includes only the single step of the method defined in the claim of the Briggs patent. A machine could be built and used which would infringe the claim of the Briggs patent without infringing the claims 4 and 5 of the British patent No. 13,366 of 1888; while, on the other hand, a machine could be built and used which would infringe the method defined in claims 4 and 5 of the British patent, but would not infringe the claims of the Briggs patent. For example, if the Eppler welter were provided with a thread finger and take-up, properly timed, the machine would infringe the claim of the Briggs patent, but would not infringe the two claims of the French and Meyer British patent. While, on the other hand, a welting machine which laid the chain on the welt and which was provided with a take-up but not with a thread finger would infringe claims 4 and 5 of the British patent, but would not infringe the single claim of the Briggs patent.

More than this, the single claim of the Briggs patent includes as an important and essential step in its method a step which is not set forth in claims 4 and 5 of the British patent, and the claims in the Briggs patent would have been patentable if a machine practicing the methods defined in claims 4 and 5 of the British patent had been a part of the prior art at the time the Briggs invention was made.

Mr. WEBSTER. All that portion of the answer relating to what was or was not patentable, with all that portion referring to what was or was not an infringement or what might or would be an infringement, is objected to as inadmissible, incompetent and an attempt on the part of the witness to pass on questions of law.

Int. 18. Have you collected under one cover various patents which have been referred to in your testimony?

Ans. I have.

Int. 19. Will you state what the volume of patents before you comprises?

Ans. The collection of patents which I produce comprises copies of all of the patents which I have mentioned in my deposition regarding welt and turn sewing machines.

[*One volume of copies of patents introduced in evidence and marked "Defendants' Exhibit 108".*]

Int. 20. Will you kindly read into the record the number, date and name of the patentee of each of those patents?

Mr. WEBSTER. And the title, too; don't you want that?

Mr. CHOATE. I don't care for it. That is to show exactly what is in this exhibit, without having to examine it itself.

Ans. No. 34,413, February 18, 1862, Destouy.

Mr. WEBSTER. The introduction of all patents issued after the date of the filing of the petition is objected to as having no bearing on the question at issue.

OUT-SOLE STITCHING MACHINES.

Int. 21. What is the function of an out-sole stitcher of the Goodyear type in the manufacture of shoes?

Ans. An out-sole stitcher is used to sew the out-sole of a welt shoe to the welt, in this manner attaching the out-sole to the shoe.

Int. 22. Mr. Chapman has testified that the subject-matter of certain Letters Patent, namely, 473,870, April 26, 1892, French and Meyer, and 474,774, May 10, 1892, French and Meyer, are embodied in the machine illustrated in Complainant's Exhibit 208, which is a photograph of on out-sole lockstitch machine manufactured by the Long Machine Company. How does the machine illustrated in Plaintiff's Exhibit 208 compare with the Goodyear rapid lockstitch out-sole machine put out by the United Company in February, 1899?

LOCKSTITCH MACHINE: GOODYEAR OUTSOLE RAPID.

Ans. I have not had an opportunity to examine the machine of which Plaintiff's Exhibit 208 is a photograph, but that machine is apparently a copy of the Goodyear out-sole rapid lockstitch machine as put out by the Goodyear Company just prior to February, 1899, and by the United Shoe Machinery Company after that date, except that the machine shown in this photograph is not organized to sew the out-soles of shoes provided with extension edges. I have examined an out-sole stitcher which bore the following name plate: "R. H. Long Machinery Company, So. Framingham, Mass., United States of America, Patent Applied For. Machine No. 870." That machine which I examined had a different base from the base shown in the Exhibit 208, owing, I assume, to the fact that it was a part of a cobbler's outfit, and it had a bobbin winder on the left end of the shelf. Otherwise that machine was a substantial duplicate of the United Company's machine of 1899, with the important exception to which I have previously referred; that is, it was not organized to sew shoes provided with extension edges.

Int. 23. What was the first patent definitely directed to a shoe stitcher of this general character?

Ans. The first patent for a machine of this type was No. 127,423, June 4, 1872, Mills. A typical claim of this patent is the second, as follows:—

"2. In a machine, as aforesaid, for sewing the welts and soles of boots and shoes, the barbed curved needle formed and moving within the small radius described, and operating in combination

with the shuttle, which lays its thread in the channel formed in the sole of the boot or shoe, substantially as set forth, for the purpose specified."

Among the later patents, illustrating drawings and setting forth in their claims machines for sewing out-soles of welt shoes, is patent No. 253,156, January 31, 1882, Campbell. The machine shown in that patent was commercially used for sewing out-soles to welts for many years.

Int. 24. Referring to the patents enumerated by Mr. Chapman, describe briefly the several alleged improvements shown and described in those patents which were embodied in the Goodyear machine of 1899 and in the Long machine illustrated in said Exhibit 208.

Ans. Referring, first, to patent No. 473,870, April 26, 1892, which was the first patent to which Mr. Chapman referred as describing in its claims mechanism embodied in the machine shown in Plaintiff's Exhibit 208, claims 1, 3, 5 and 6 of that patent describe the mechanisms connecting the pull-off and presser foot. Claims 4, 10 and 11 describe the mechanism for positively operating the thread lifter. Claim 7 is directed to mechanism for actuating the looper, and claims 8 and 9 of the mechanism employed in that machine for adjusting the thread clamp. The mechanism set forth in all of the eleven claims of this patent No. 473,870 was embodied in the out-sole rapid lockstitch machine as it was put out by the Goodyear Shoe Machinery Company just prior to February, 1899.

Patent No. 474,774, May 10, 1892, French and Meyer, the subject-matter of which Mr. Chapman also found to be embodied in the machine of Plaintiff's Exhibit 208, describes in its three claims the presser-foot lifting mechanism used in the Goodyear out-sole rapid lockstitch machine in 1899.

Patent No. 424,966, April 8, 1890, French and Meyer, was also discussed by Mr. Chapman in connection with the machine of Plaintiff's Exhibit No. 208. Assuming that that exhibit is a photograph of a machine substantially like the Long machine No. 870 which I have stated I have examined, I do not agree that the ma-

chine of Exhibit 208 does not include the mechanism defined in the first claim of this patent. If this claim is entitled to any liberality at all in the application of the doctrine of equivalents, it will, in my opinion, set forth mechanism which is incorporated both in the Goodyear out-sole lockstitch machine of 1899 and in the Long stitcher, although, of course, the utility of this mechanism is limited to the oscillating type of shuttle. Both of these machines, however, that is, both the Goodyear machine of 1899 and the Long stitcher, used the oscillating type of shuttle.

[*Adjourned to 10* A. M., *Tuesday, October 7, 1913.*]

BOSTON, MASS., October 7, 1913.

Present: ALLEN WEBSTER, Esq., *of Counsel for Complainant;*
BENJAMIN PHILLIPS, Esq., *appearing as counsel for Defendant, in the absence of* Mr. CHOATE.

Direct Examination by BENJAMIN PHILLIPS, Esq., *of Counsel for Defendant.*

Int. 25. Did the Goodyear stitchers put out by the United Company in 1899 involve any features of construction and organization not embodied in the machine illustrated in Complainant's Exhibit 208? If so, state what they were and their importance in the art. If the same were shown and described in Letters Patent of the United States, state the patents.

Ans. The Goodyear out-sole stitcher as put out by the Goodyear Company just prior to 1899 and by the United Company immediately after February, 1899, embodied the organization set forth in claims of the following patents: —

No. 563,471, July 7, 1896, French and Meyer.

No. 563,472, July 7, 1896, French and Meyer.

No. 582,510, May 11, 1897, Shriner and Adams.

The mechanism set forth in the claims of the three patents which I have just enumerated was described more broadly in an application for a patent which was then pending and upon which there was subsequently granted patent —

No. 675,783, June 4, 1901, Meloon.

In general terms the mechanism set forth in the claims of these

four patents which I have enumerated consisted in an organization in an out-sole stitching machine which adapted that machine to attach the out-soles of welt shoes, which were provided with extension edges. The term "extension edge" has been used generally to include what is more properly known as a Scotch edge, and what is usually termed a Baltimore edge.

I produce a shoe which is provided with a Scotch edge. In this shoe it will be noted that the edge of the sole around the forepart extends a substantial and uniform distance from the upper.

[*Shoe, extension edge, Scotch, introduced in evidence and marked "Defendants' Exhibit 109".*]

[*Answer to Int. 25 continued:*]

I produce also a shoe provided with a Baltimore edge, and call attention to the fact that in this shoe the edge also projects from the upper around the forepart, but that the extension is not uniform. The projecting edge of the sole increases gradually from the middle of the toe around the outside of the shoe and the width is greatest adjacent to the ball. On the inside of this particular shoe the extension edge on the sole increases gradually in width from the middle of the toe around the inside of the shoe, to a maximum width adjacent to the ball. There is a wide variety in the contours which are imparted to the extension edges of Baltimore edge shoes in their manufacture, according to the style of the shoe or the demand of the customers for whom these shoes are made.

[*Shoe, extension edge, Baltimore, introduced in evidence and marked "Defendants' Exhibit 110".*]

[*Answer to Int. 25 continued:*]

Of these two types of extension edges, that with the Scotch edge — that is, the extension with uniform width all around the forepart — is the older. Prior to 1895 shoes had for many years been made by hand which were provided with Scotch edges. The Baltimore edge was of more recent development, but that had, prior to about 1895, been used in hand-made shoes for several years.

I call attention to the fact that in both of the shoes which I have produced, Defendants' Exhibit 109 and Defendants' Exhibit 110, the edge of the sole is narrower in the shank than in the forepart.

And in the forepart, where substantial utility is secured by the wider edge, the maximum width of that extension in the Baltimore edge shoe is located at the part of the shoe where the advantages of the extension are most needed.

It is common experience that in the wear of a shoe the upper leather stretches. This is due partly to the elastic character of the leather, and partly to the strain upon the leather across the ball of the foot which is caused in walking. This stretching causes the upper to spread across the ball, and after the upper has been so stretched the outline of the stretched upper will be approximately parallel with the edge of the sole in the usual type of Baltimore edge shoe. Accordingly the extension edge affords a proper support for the upper, and for the foot at exactly the point where that additional support is needed; that is, at the ball, where the greatest stretching of the upper takes place. It is across the ball, also, that the wearer of the shoe needs the maximum support for the foot in walking, and the total width of the sole of an extension edge shoe, increased as it is by the extension edge of maximum width in the ball, affords the maximum support for the foot of the wearer across the ball where that maximum support is needed.

Another practical advantage of the Baltimore extension edge sole relates to the usual tendency of the foot to turn over toward the outside of the shoe. This tendency is resisted by the wider edge on the outside of a Baltimore edge shoe. A still further advantage in an extension edge, which projects beyond the upper all around the forepart, is that it protects the upper of the shoe and the foot of the wearer from injury in case of accidental contact with an obstacle in walking. It has been my own experience that many times I have avoided injury to my foot, when I have accidentally kicked against an obstacle in walking, by taking the force of the blow upon the extension edge of my shoe instead of upon the upper.

As I have stated, Scotch edges were made by hand for many years prior to 1895, and Baltimore edge shoes were also made by hand for several years prior to that date, and up to that date there had been provided no machines which were organized to sew the out-soles of shoes provided with extension edges.

Defining somewhat more specifically the extension edge organization of the out-sole rapid stitcher as it was put out in 1899, that organization enabled the machine to attach the out-sole to the welt by a line of stitching which was located around the forepart of the shoe as close as practicable to the edge of the sole, providing for this without interfering with the normal operation of the machine in the shank. It is desirable that the outseam in the shank shall be located as close as possible to the edge of the last. On the other hand, it is important that around the forepart the outseam shall be located as close as is practicable to the edge of the sole. Such location of the outseam around the forepart is important, because it prevents the out-sole and the welt from springing apart, which would not only result in unsightly appearance but would admit moisture between the welt and the out-sole, which would result in the rotting of the thread, and eventually in the breaking of the seam and the tearing away of the sole from the welt.

In 1899 two types of extension edge mechanisms were supplied to users of the Goodyear out-sole stitcher. These were known as types A and B. Type A was described in the claims of patent No. 675,783, June 4, 1901, Meloon, and No. 563,471, July 7, 1896, French and Meyer. Type B was described in the claims of patent No. 675,783, June 4, 1901, Meloon; No. 563,472, July 7, 1896, French and Meyer; and No. 582,510, May 11, 1897, Shriner and Adams.

It will be noted that I have included in the list of patents on both types patent No. 675,783, June 4, 1901, Meloon. This patent sets forth in its first claim an organization of out-sole stitching machine which enables such a machine to attach the soles of extension edges. The first claim of that patent is as follows:—

"1. In a sole sewing machine for uniting the outer sole and welt of a shoe while the shoe is on the last, the combination with the stitch forming mechanism, of means external to the shoe for engaging the outer sole and welt and holding both against the endwise movement of the needle, and a guide for engaging and externally guiding the shoe, the said guide being movable during the stitching operation for the purpose of varying at the will of the operator the position of the guide with relation to the stitching

mechanism, whereby the line of stitching may be located nearer to or farther from the upper, as set forth."

In 1899 manufacturers were divided in their preference as to the type of extension edge mechanism which was better adapted for their work. In recognition of this preference either type was supplied as ordered by manufacturers. Within a few years after 1899, however, the demand for type B fell off rapidly and type A was generally supplied with the machine. After 1899 the proportion of shoes which were made with extension edges increased rapidly, and by 1908 the demand for an out-sole stitcher organized for extension edge work was so universal that at the beginning of that year the out-sole stitcher as supplied by the United Company was regularly organized for this work.

At the end of the company's fiscal year March 1, 1911, practically all, if not every one, of the out-sole stitchers which were being used for attaching the out-soles of welt shoes were organized to sew extension edge shoes. At that time, as at the present time, and in fact as for some years prior to March 1, 1911, nearly all welt shoes, both men's and women's, which were being manufactured were provided with extension edges, and I am satisfied that no manufacturer in the country was not making the greater part, in fact nearly all, of his shoes with extension edges. Prior to the date which I mentioned, March 1, 1911, an organization for sewing extension edges had been incorporated in the model K out-sole stitcher which, as I shall explain later, was adopted in May, 1910, and superseded the out-sole stitcher of 1899.

Finally, as to the importance and value of an organization in an out-sole stitching machine which will enable it to attach the soles of extension edge shoes, I should state that in my opinion it is quite as important that the machine should be able to handle the shoe properly in such manner as to locate the line of stitching where good shoemaking requires that it should be located, as it is that the machine should properly form the stitch; and I regard the extension edge organization as important and as essential a part of an out-sole stitching machine under modern conditions as are the needle and awl.

Another improvement which was made in the Goodyear out-sole stitcher just prior to 1899 was the embodiment in it of mechanism which would bevel the welt simultaneously with the stitching. This mechanism was constructed as is described in all twelve claims of patent number 704,458, July 8, 1902, Hadaway. This improvement was set forth in more general terms in reissued patent No. 11,578 [original patent No. 549,124, November 5, 1895], and in patent No. 704,457, July 8, 1902, Hadaway.

Claim 7 of reissued patent No. 11,578 is as follows: —

"7. The combination with the stitch forming mechanism of a shoe sewing machine, of mechanism for feeding the work, and welt beveling mechanism arranged to bevel the welt during the sewing operation, substantially as described."

The advantage of this improvement was that such manufacturers as desired to perform this operation upon their shoes could in the use of an out-sole stitcher provided with this improvement perform the welt beveling and the stitching operation simultaneously, thus obviating the necessity on such work of performing the welt beveling operation subsequently, either by hand or by another machine operation.

Int. 26. State whether or not, since 1899, there have been any improvements or modifications introduced in or in connection with the Goodyear stitcher put out by the United Company. If so, what they were; the reason for them, and their importance in the art. If the same were shown and described in any Letters Patent of the United Company, name those patents.

Ans. I will first state that in 1910 a radically new out-sole stitching machine was put out by the United Company which was known as model K, and which superseded the out-sole stitching machine of 1899, and that model K was in turn superseded in 1912 by another new model, which was known as model M. Before discussing these machines, however, I will refer to a series of very useful improvements which were made in the out-sole stitcher of 1899 during the years following.

One of the most important of these improvements consisted in the organizing of the 1899 out-sole stitcher to stitch the outsole to

the welt by what is known as a "fudge stitch". The practice of sewing out-soles with a fudge stitch was introduced about 1905. Prior to that date it had been the practice to sew the out-sole by a stitch which was laid upon the upper surface of the welt, and these stitches were afterward "separated" by forming an indentation in the interval between successive stitches. About 1905, however, manufacturers decided that they preferred to finish the upper face of the welt in a different manner. That is, by wheeling this upper face of the welt to form imitation stitch impressions, and then by burnishing the stitch impressions so formed. To enable the face of the welt to be finished in this manner it was desirable that the stitches should be sunk below the face of the welt, to avoid injuring or possibly cutting the stitches in the operations of welting and burnishing.

The fudge stitch is shown in both exhibits of extension edge shoes which I have produced, Defendants' Exhibits Nos. 109 and 110. It will be observed that the fudge stitch presents a very attractive appearance, which is neater and more finished than is the edge of a shoe which has the stitches separated. In addition to this neat and attractive appearance, substantial practical advantages are secured in sewing the outsole by a fudge stitch. It is possible to make the stitches longer, since they are not visible on the top of the welt, and this effects an economy in both the amount of thread needed for a shoe and in the time required for the outsole stitching operation. It is entirely practicable to attach a sole satisfactorily and securely by longer stitches than would be permissible in a shoe as it is usually made when the stitch-separating operation is performed. A further advantage of the fudge stitch is that it is practicable to use a grade of welt which, while as strong and serviceable as the welt used in the shoes in which the stitches are separated, lacks the smooth finish which is required when the stitches are to be separated.

The United Company produced several types of mechanisms, either of which could be included in the organization of the out-sole stitcher to enable it to sew soles to the welt with the fudge stitch. The general principle of the operation of these several types was the

same. Each of them provided the machine with a knife arranged to form a slit in the upper face of the welt, and located just in advance of the needle so that the slit was formed in exactly the right location to receive each stitch as it was immediately to be made after the successive operations of the knife.

Furthermore, as it is usually desired to attach the sole with the fudge stitch only around the forepart, each of these fudge-stitch mechanisms was so organized that it was rendered operative at the same time that the extension edge mechanism was rendered operative, to provide for the proper sewing of the extension edge around the forepart.

The patents owned by the United Company which support in their claims these fudge stitch organizations are as follows: —

No. 900,925, October 13, 1908, Haradon (application filed February 4, 1907).

No. 946,591, January 18, 1910, Arnold (application filed December 8, 1905).

No. 1,017,380, February 13, 1912, Cady and Thayer (application filed October 11, 1907).

No. 1,017,397, February 13, 1912, Fletcher and Maclean (application filed March 31, 1905).

No. 1,027,791, May 28, 1912, Allen (application filed February 8, 1906).

Of the patents in the above list, Nos. 946,591, 1,017,397, 1,027,791 set forth in their claims mechanism embodied in all of the types of fudge-stitching mechanism which were supplied by the United Company with its out-sole rapid lockstitch machine. That is the machine of 1899. The patent which sets forth such an organization in its claims in the broadest terms in No. 946,591. A typical claim of this patent is the first, which is as follows: —

"1. An outseam sewing machine, having, in combination, stitch-forming mechanism including a curved hook needle, a work support engaging the shoe externally to support the welt and outsole in proximity to the needle and a welt channeling knife located in close proximity to the path of the needle for cutting a channel in the welt in advance of the stitch forming mechanism and in proper position with relation to the stitch forming mechanism so that the

seam of stitches shall be sewn in the bottom of the channel thus cut, substantially as described."

A typical claim of patent No. 1,017,397, which also describes in its claims in general terms the type of fudge-stitch mechanisms supplied on the outsole rapid stitcher, is claim 4, which is as follows: —

"4. In a sole sewing machine the combination with stitching mechanism of means for gauging the distance of the stitch from the edge of the sole, means acting in advance of said stitching mechanism for forming a slit in the leather and means for throwing said slit forming mechanism into or out of engagement upon change in said gauging means."

The practice of making shoes with the fudge stitch, which, as I have stated, began about 1905, became very general, and by 1908 over 75 per cent of all men's black shoes and nearly all women's black shoes were fudge stitched. The practice has continued, and in substantially the same proportion, to the present day. I have no hesitation in stating that modern commercial conditions require that an out-sole stitching machine be organized to sew out-soles with the fudge stitch.

In addition to the organization for enabling the out-sole stitching machine to attach the soles by the fudge stitch, a number of other improvements were embodied from time to time in the out-sole rapid lockstitch machine of 1899. An improved bobbin-holding mechanism was adopted in May, 1905. This is defined in the claims of patent No. 1,048,565, December 31, 1912, Meyer (application filed August 16, 1905).

This mechanism was improved by the construction set forth in patent No. 1,015,023, January 16, 1912, Hatch (application filed March 10, 1910), and the improved construction was adopted in November, 1908, as a regular equipment for the machine. In 1910 an improved bobbin tension was first incorporated in this machine and it became the regular equipment for the machine in January, 1911. This improvement has also been incorporated in nearly all of the out-sole stitchers which had previously been put out. This improvement is set forth in the claims of patent No. 974,309, Nov-

ember 1, 1910, Thayer, and No. 974,757, November 1, 1910, Dow. This improved mechanism has been continued in the later models of the out-sole stitcher, which, as I have previously indicated, were adopted, respectively, in 1910 and 1912.

In July, 1909, a needle-oiling device became a part of the regular equipment of the out-sole stitcher. This improvement is set forth in the claims of patent No. 641,330, January 16, 1900, Rush, and No. 922,696, May 25, 1909, Hadaway.

In addition to the improvements which I have enumerated which were adapted for all kinds of work and, as I have stated, were incorporated as parts of the organization of the out-sole stitcher, several improvements have been made in the machine which adapted it to do special kinds of work, and which, therefore, were not needed on all machines. These special equipments were, first, a presser foot provided with a channeling knife which enabled the machine to form a channel in the out-sole to receive the stitch simultaneously with the stitching operation. This improvement is defined in the claims of the patent No. 1,048,719, December 31, 1912, Meyer (application filed April 15, 1910).

Second, a presser foot with grooving knife which adapted the machine for the kind of work known as "stitching aloft" was adopted in March, 1909. The kind of work for which this special equipment was intended is illustrated in Defendants' Exhibit 109. This improvement is defined in the claims of patent No. 1,030,767, June 25, 1912, Beckman (application filed March 18, 1910).

Third, another special equipment for the out-sole stitcher was a welt-guide which adapted the machine for attaching the soles of that class of shoes known as "stitch downs". This improvement was adopted in February, 1910, and is not as yet shown in any granted patent.

In addition to the improvements which I have enumerated, important improvements were made from time to time, during the period after February, 1899, in the wax pots which were used on this machine. The wax pot which is known as type B and which was used as early as 1899 is set forth in the claims of patent No. 732,729, July 7, 1903, French and Meyer. A steam wax pot known

as type C, which was first put out in September, 1904, is set forth in the claims of patent 930,115, August 3, 1909, Alley.

In March, 1907, a greatly improved steam wax pot known as type D was first put out. This is defined in claims of patent No. 1,015,304, January 23, 1912, Eppler (application filed February 26, 1906). Further improvements represented in what is known as type E were adopted in January, 1910, and are defined in patent No. 1,015,304, which I have just mentioned, and also in patent No. 1,023,071, April 9, 1912, Eppler (application filed November 22, 1909).

These wax pots which I have last named, types D and E, have been used exclusively on the new models of the out-sole stitcher, models K and M, and also many of the old type of out-sole stitcher, that is, the machine of 1899, which had previously been put out were equipped with these improved wax pots after their adoption.

As to the importance of these improvements in wax pots, I should explain that it is highly important that the wax through which the thread passes on its way to the stitch-forming mechanism should be kept at the right temperature. If the wax is not kept hot enough, lumps form in the wax; these get on the thread, interfere with the operation of the wax stripper and prevent proper operation of the mechanism for putting the tension on the thread. On the other hand, if the wax is kept too hot certain of its constituents will evaporate and what is left will be hard and brittle and entirely unfit for use. Further, if the wax is kept too hot, it boils over. It was a common experience when old types of wax pots were used in connection with this machine to find as much wax on the floor under the wax pot as there was in the pot.

During all this period subsequent to 1899 when, as I have explained, the out-sole rapid stitcher was being improved to enable it to do the work required by the changing commercial conditions, the United Company was carrying on experimental work with a view to producing an entirely new out-sole rapid lockstitch machine, and during this period some four or five inventors were almost constantly engaged in experimental work looking to the production of such a machine. As a result of a long period of

experimental work there was finally developed a machine which, in May, 1910, was first put out for commercial use. The official name of this machine is "Lockstitch Machine, Model K, Goodyear Outsole Rapid". For convenience I shall hereafter refer to the machine as the model K machine.

LOCKSTITCH MACHINE: GOODYEAR OUTSOLE RAPID, MODEL K.

This model K outsole stitcher was a radically new machine, entirely different from any out-sole stitcher ever before used. In the experimental work which resulted in the production of this machine the primary object which was aimed at was the production of a machine which would run at a much higher speed than the 1899 out-sole stitching machine, and which, by virtue of its higher speed, would have a greater capacity than that machine. It was also endeavored, in the production of this machine, so to organize it that it would do better work and would enable the operator to operate it more conveniently.

The speed of the out-sole stitching machine of 1899 was limited, under practical commercial conditions, to 375 stitches per minute. The reasons for this limit to the speed of that machine were, first, the machine was organized with an oscillating shuttle and the burden of oscillating in two directions at each operation of the machine the comparatively heavy parts which comprised this shuttle mechanism stood in the way of a high speed for this machine. Second, the machine comprised in its organization a very heavy feed slide which had to be reciprocated in two directions at each operation of the machine. It was impracticable to reciprocate this heavy feed slide more rapidly than was done when the machine was run at a speed of 375, because the wear on the parts which operated the feed slide would soon become excessive at higher speeds and the operation of that slide would become uncertain, resulting in uneven feed of the work.

Third, another serious defect in the 1899 machine when it was run at high speed was due to the overthrow of the take-up. At high speed the inertia of the parts and the tendency of all lost motion in the operating mechanism occasioned by wear of the parts

or for other reasons to concentrate at the operative end of the take-up lever, are likely to cause inaccurate operation of the take-up, so that the lock of the stitch would not be properly located.

Fourth, in the organization of the out-sole stitching machine of 1899 the presser foot was always held in pressing engagement with the work. While the mechanism which forced the presser foot against the work was yielding, the presser exerted by it had to be substantial in order to force together properly the layers of work upon which the machine was operating. When the work increased in thickness as the operation of the machine proceeded, it was necessary for the work to wedge the presser foot away from the work table, which made the operation of the awl in the work-feeding mechanism harder and also frequently caused the awl to crowd the stock in front of it, which caused uneven stitches.

Fifth, the operative parts of the 1899 machine were actuated by cams and heavy levers and many operations of the stitch-forming mechanism, especially the awl, needle and take-up, required for their proper timing in the cycle of the machine's operations very abrupt cam movements which alone made it impracticable to run the machine at high speed.

All of the objections which I have enumerated to the out-sole stitcher of 1899 and the defects in the machine which rendered it impracticable to run the machine at a high speed were overcome in the model K machine introduced in May, 1910. Referring now to the improvements which enabled that machine to be run at a higher speed, as well as to produce better work, its organization included, instead of the heavy oscillating shuttle of the 1899 machine, a constantly rotating loop-taking hook which rotated always in the same direction and was operated in combination with a stationary thread case.

It has been found very advantageous in an out-sole stitcher so to organize the stitch-forming mechanism that the needle shall enter the stock before the awl has left it, and to secure this mode of operation in the model K machine the loop-taking hook to which I have referred was arranged to rotate three times during each cycle of the machine's operations, and in one of these rotations to take the

thread from the needle and carry it around the bobbin. Other improvements to which I shall not take time to refer made this shuttle mechanism of the model K machine extremely satisfactory in operation and very convenient for the operator.

Instead of the very heavy feed slide of the 1899 out-sole stitching machine, which, as I have explained, had to be reciprocated completely 375 times per minute in the regular operation of that machine, and which rendered it impracticable to run that machine at a higher speed, this new model K machine was provided with a very light feed slide which was operated by light pivoted levers as compared with much heavier operating mechanism for the feed slide of the old 1899 machines.

I produce a feed slide of the model K machine and also a feed slide of the old 1899 machine. The feed slide of the model K machine weighs three ounces; the feed slide of the old 1899 out-sole stitcher weighs four pounds and fourteen ounces. That is, the parts which had to be reciprocated in a right line at every operation of the old lockstitch machine of 1899, 375 times a minute, weighed twenty-five times as much as the parts which have to be reciprocated in the feeding of the work in the model K machine.

[*Feed slide of model K out-sole stitcher so produced is marked "Defendants' Exhibit 111".*

Feed slide of out-sole rapid stitcher of 1899 so produced is marked "Defendants' Exhibit 112".]

[*Answer to Int. 26 continued:*]

The difficulties attending the tendency of the take-up of the old out-sole stitcher, the 1899 machine, were overcome in the new model K machine by so organizing take-up of that machine that its operative end moved in the arc of a circle, so defined in relation to the stitch-forming mechanism that the operative end of the take-up always moved past a point at which it was at the greatest distance from the stitch-forming mechanism into a position of rest at which it was nearer to the stitch-forming mechanism. By this organization any overthrow of the take-up was of no importance, because it would take effect after the take-up had passed the point at which it

was at the greatest distance from the stitch-forming mechanism, and at which it had located the lock of the seam.

Associated with this improved take-up was an improved auxiliary take-up mechanism. The auxiliary take-up of the old machine was spring controlled, so that it would yield, to give up thread as required. The auxiliary take-up of the new model K machine was so organized that while yielding in its operation, as was needed, it was given positive movements to give up thread as required, and to co-operate properly with the improved take-up mechanism.

Another important advance in the organization of the model K machine over the 1899 machine was the means for lifting the presser foot to free the work from pressure during the feeding of the work by the awl. Combined with this mechanism was means for giving to the presser foot a positive compressing movement which caused it to force the stock together preparatory to the formation of the stitch.

All of the objections which I have enumerated to the presser-foot mechanism of the 1899 machine were overcome by this construction. The organization of an out-sole stitching machine by which the presser foot is operated to force together the layers of stock before the formation of the stitch is set forth in the third claim of patent No. 1,030,582, June 25, 1912, Hadaway (application filed September 29, 1904). This claim is as follows: —

"3. Presser foot mechanism for sewing machines, having, in combination, a work support, a presser foot movable toward and from the work support to accommodate stock of varying thickness, and means for positively moving the presser foot a predetermined uniform distance toward the work support from any position which it assumes in accommodating stock of varying thickness, substantially as described."

I have endeavored to mention only those features of the organization of the model K machine which are of more striking character. Without taking time to refer to others, I will state that the machine incorporated in its organization many other improvements which contributed in the attaining of high speed, and to the successful use of the machine under commercial conditions.

The machine runs under commercial conditions at a speed of

from 540 to 550 stitches per minute. The machine is easily capable of a speed of 650 stitches per minute and, undoubtedly, will eventually be run at that speed. The machine has a capacity over the 1899 out-sole stitching machine of about thirteen per cent.

While many of the improvements embodied in this model K out-sole stitcher are not shown in patents which have as yet been granted, many improvements are set forth in general terms in the following patents: —

No. 553,139, January 14, 1896, Smith.

No. 563,471, July 7, 1896, French and Meyer.

No. 675,783, June 4, 1901, Meloon.

No. 916,092, December 8, 1908, Bayard.

No. 922,696, May 25, 1909, Hadaway.

Mr. WEBSTER. I would like to interpose an objection here.

The petitioner objects to reference to any patents issued after the filing of the petition.

[*Answer to Int. 26 continued:*]

This model K out-sole rapid lockstitch machine, which, as I have stated, was first put out in May, 1910, superseded the machine officially known as "Lockstitch Machine, Goodyear Outsole Rapid"; that is, the out-sole rapid stitcher of 1899. A large number of these machines have been put out. During the fiscal year of the company ending March, 1912, 543 were put out into shoe factories. The United Company has always been behind in filling its orders for the machine, and in May, 1911, it was 145 machines behind its orders.

This model K out-sole stitching machine, although, as I have stated, it was put out as recently as May, 1910, was in turn superseded in January, 1912, by another model known officially as "Lockstitch Machine, Model M, Goodyear Outsole Rapid".

LOCKSTITCH MACHINE: GOODYEAR OUTSOLE RAPID, MODEL M.

The reason for the short life of the model K out-sole stitching machine as the standard commercial machine of the United Company was that inventors of the United Company had continued actively at work in making further improvements in machines of this type and their improvements were of such value that officials of the United Company decided that the company's commercial machine must be provided with these improvements.

The new model M machine, which, since January, 1912, has been the standard commercial out-sole stitcher put out by the United Company —

Mr. WEBSTER. Let me interpose, right there, that the petitioner objects to all evidence relating to matters occurring since the filing of the bill.

[*Answer to Int. 26 continued:*]

Let me repeat: the new model M machine, which, since January, 1912, has been the standard commercial out-sole stitcher put out by the United Company, is founded upon the model K machine, and incorporates substantially all improvements which characterize that

machine, with the addition of other important improvements to which I will now refer.

One of the most striking improvements in the model M machine, over all out-sole stitching machines previously used or known, related to the stopping of the machine. In the operation of the model K out-sole stitcher and in the operation of the out-sole stitcher of 1899, it was necessary for the operator to stop the machine by putting his hand upon the belt pulley of the machine as he neared the end of the stitch. This was a serious objection in both the 1899 machine and the model K machine, because at the time when the operator desired to stop the machine, that is, at the end of the stitching, he was finishing up the stitching in the shank, which is the most critical part of the operation of the out-sole stitcher, and he was accordingly obliged to withdraw the support of one hand from the shoe at that critical stage in the operation on the shoe. This objection, while serious in the 1899 machine, was still more serious in a high-speed machine because the operator would be obliged to allow more time for the stopping of the machine, and accordingly to withdraw the support of one hand from the shoe at a time when more of the work remained to be done in the shank.

These objections to prior machines were overcome in the new model M out-sole stitcher, that is, the present commercial machine of the United Company, by an improvement which automatically stops the machine at the desired point. This improvement comprises a mechanism which, at whatever speed the machine may be running at the time the operator wishes to stop it, first reduces the speed to a pre-determined low speed, and then automatically stops the machine at the proper time in the cycle of its operations, always at the same point.

I should explain that the incorporation of this improvement in the model M out-sole stitcher was due to the fact that Thomas G. Plant had provided out-sole stitching machines with an automatic stopping mechanism, and observation of the Plant machine had led inventors of the United Company to believe that a successful mechanism for stopping the machine, something which had long

been desired but had never before been provided in the out-sole stitching machine, could be devised which would operate satisfactorily. The Plant mechanism was far from satisfactory as it was not a good mechanical arrangement and occasioned much trouble through breakage. After the acquisition of the Plant patents by the United Company, in September, 1910, five different inventors employed by the United Company were put to work upon the problem of providing a commercially satisfactory stopping mechanism which could be incorporated in the organization of the model K out-sole stitcher, which was then the standard commercial machine of the United Company. The mechanism finally produced by the joint work of these five inventors was that which I have described and was entirely different in structure and mode of operation from the Plant mechanism. The organization of the model M out-sole stitching machine, which provides for this automatic stopping always at the same point in the cycle of the machine's operation, is not shown in any patent which has as yet been granted, but is defined in general terms in patent No. 710,612, October 7, 1902, Richardson. A typical claim of this patent is No. 29: —

"29. A sewing machine having a driving shaft adapted to stop at a fixed point in its rotation, means for stopping said shaft at said fixed point, stitching mechanism connected to and operated by said shaft, two driving mechanisms, rotating at different pre-determined speeds for driving said shafts, and manually controlled devices for connecting either of said driving mechanisms, with said shaft, and for causing the actuation of the stopping means."

To indicate the practical importance of this stopping mechanism as well as to suggest one of the problems which had to be met in producing it, I will explain that in the operation of an out-sole stitching machine the operator usually desires when sewing the out-sole at different parts of the shoe to run the machine at different speeds, and it is necessary that any automatic stopping mechanism shall be so organized that it will operate always in the same way and always stop the machine at the same point in its cycle of operations, at whatever speed the machine be running; whether, for example, it be running at a speed of 200 stitches per minute or at a speed of 500 stitches per minute. Obviously, however, the

2297

momentum of the parts of the machine at a speed of 200 is much less than the momentum of those parts at a speed of 500.

Another important and valuable improvement embodied in the model M machine comprises the mechanism for automatically lifting the presser foot when the machine stops. In explaining the improvements over the 1899 machine which were embodied in the model K machine, that is, the immediate predecessor of the model M machine, I stated that the model K machine was so organized that the presser foot was lifted during each feeding operation, so that it had the important advantage over the 1899 out-sole stitching machine that it was not necessary to feed the work against the pressure of the presser foot. In the use of the model K machine, however, as in the use of the 1899 machine, it was necessary for the operator when he had finished the operation upon each shoe to lift the presser foot by hand, engaging a hand lever for that purpose. He had to repeat this operation when he began to sew the next shoe, so that he had to lift the presser foot manually twice for each shoe presented to the machine. The model M machine was so organized that when the machine stopped the presser foot was automatically lifted and remained in raised position until the machine was again started with a shoe in position for the stitching operation, when the presser foot descended and held the shoe properly for the stitching operation. This improvement contributed greatly to the convenience of the operator. As I have explained, in the older machines he had to raise the presser foot manually twice for every shoe.

In addition to obviating this difficulty, his convenience was facilitated because he was able to hold in his hand throughout the operation on each shoe the knife which he must use at the completion of the operation to sever the thread. In the use of prior machines it was necessary for the operator before he could free the shoe from the machine to reach for the hand knife, cut the thread and then move his hand again to put the knife down. By the improvement to which I am now referring, combined with the automatic stopping of the machine which made it unnecessary for the operator to take his left hand off the shoe to stop the machine,

the machine was made so convenient for the operator that it was entirely practicable for him to hold the knife in his hand throughout the operation upon the shoe.

This improved presser-foot organization of the commercial model M machine is not as yet shown in a granted patent, but one of its features is set forth in broad terms in patent No. 710,613, October 7, 1902, Richardson, of which claim 16 is as follows: —

"16. A machine of the character described comprising a presser-foot resting on the surface of the work and adjusted automatically thereby, mechanism for locking said presser-foot in operative position, and a stop mechanism controlling the operation of the machine, said parts being arranged and operated whereby the presser-foot is automatically released when the stop motion is actuated to stop the machine, whereby the said presser-foot is then free to be moved manually."

The organizations of the model M out-sole stitching machine, the present commercial out-sole stitching machine supplied to manufacturers by the United Company, is not shown as a whole or in any of its parts in any patents which have as yet been granted, but the general organization and many important features of the organization are set forth in general terms in the following patents owned by the United Company: —

No. 553,139, January 14, 1896, Smith.
No. 563,471, July 7, 1896, French and Meyer.
No. 675,783, June 4, 1901, Meloon.
No. 710,612, October 7, 1902, Richardson.
No. 710,613, October 7, 1902, Richardson.
No. 906,092, December 8, 1908, Bayard.
No. 922,696, May 25, 1909, Hadaway.
No. 940,055, November 16, 1909, Plant.
No. 940,723, November 23, 1909, Plant.
No. 940,725, November 23, 1909, Plant.
No. 946,591, January 18, 1910, Arnold.
No. 963,761, July 12, 1910, Hadaway.
No. 974,309, November 1, 1910, Thayer.
No. 974,757, November 1, 1910, Dow.

No. 1,015,304, January 23, 1912, Eppler (application filed February 26, 1906).

No. 1,015,772, January 30, 1912, Ashworth (application filed November 22, 1909).

No. 1,017,397, February 13, 1912, Fletcher and Maclean (application filed March 31, 1905).

No. 1,023,071, April 9, 1912, Eppler (application filed November 22, 1909).

No. 1,027,791, May 28, 1912, Allen (application filed February 8, 1906).

No. 1,030,582, June 25, 1912, Hadaway (application filed September 29, 1904).

Attention should be called to the fact that both the model K out-sole stitching machine, that is, the machine introduced in 1910, and the model M machine, the present standard commercial machine of the United Company, are provided with organizations for sewing extension edges and for attaching out-soles with the fudge stitch. These mechanisms are set forth in broad terms in the claims of several patents which I discussed in connection with the out-sole stitching machine of 1899, and in addition these mechanisms have been improved in the model K and model M machines. The improved mechanisms are not shown in any patents which have as yet been granted.

The model M out-sole stitching machine has been received by shoe manufacturers with even greater favor than its immediate predecessor, the model K machine. The model M machine represents a great advance in the industry. Owing to its speed, which, like the model K machine, is from 540 to 560 stitches per minute, as compared with 375 stitches per minute for the 1899 out-sole stitching machine, and to the striking improvements to which I have referred which do away with several manual operations which the operator of the machine had to perform for every shoe which he stitched upon the 1899 machine, or the model K machine, which operations are all performed automatically by the model M machine, and owing to the great saving of the operator's time which is effected by the model M machine, as I have pointed out in some

detail, this model M machine, the present commercial machine, has an increased capacity of eight per cent over its immediate predecessor, the model K machine, and its capacity is about twenty-two per cent greater than that of the 1899 machine. The success of the machine is indicated by the fact that although it was first put out for commercial use as recently as January, 1912, 985 of the model M machines were in commercial use in shoe factories on September 1, 1913. The facilities of the company's factory for building this machine have been overtaxed all the time since it was introduced, and on the 1st of January, 1913, the company was 256 machines behind in filling its orders for model M machines.

I produce copies of patents which I have mentioned in the foregoing deposition relating to out-sole stitching machines. For convenience these patents have been bound in one volume.

[*Patents relating to out-sole stitching machines, used by the witness, are offered in evidence and marked "Defendants' Exhibit 113".*]

Mr. WEBSTER. Please note the objection of counsel for petitioner to the exhibits so far as the patents issued after the date of the filing of the petition are concerned, these having no bearing touching allegations of the bill.

ROUNDING AND CHANNELING MACHINES.

Int. 28. What was the function of a rounding and channeling machine like the Universal machine referred to by Mr. Chapman?

Ans. This machine was used to shape the sole of a welt shoe and to form simultaneously the channel to receive the outseam which was subsequently to attach the sole to the welt, and the operation was performed after the out-sole had been "laid", that is, temporarily attached to the shoe by cement, so that the shaping of the

sole and the forming of the channel was performed by the machine while the sole was on the shoe, and the operation of the machine was performed to adapt the shape of the sole and the location of the channel for the particular shoe and in relation to the shape of the last. Before it was operated upon by the rounding and channeling machine the sole was usually in the form of a "blocked sole", as is shown by the Defendants' Exhibit 102.

Int. 29. Mr. Chapman has compared the machine represented in Complainant's Exhibit 233, which is a machine of the Goodyear manufacture, with Briggs patent No. 463,982, dated November 24, 1891, and with French and Meyer patents 600,883, March 22, 1898, and 599,602, February 22, 1898. Describe briefly the subjects-matter of those several patents as the same are embodied in the machine represented by the Complainant's Exhibit 233?

Ans. The first of the patents referred to by Mr. Chapman, No. 463,982, November 24, 1891, Briggs, represents a step in the development of the machine which was known as the "Briggs rounding machine", the commercial form of which is shown in patent No. 511,263, December 19, 1893, Briggs and Dancel. That machine, that is, the Briggs rounding machine, was put out for a time, but about 1896 was superseded by the Goodyear Universal rounding and channeling machine.

ROUNDING AND CHANNELING MACHINE — GOODYEAR UNIVERSAL.

The commercial form of this Universal machine as it was put out by the Goodyear Company after 1896 is shown in patent No. 599,602, February 22, 1898, French and Meyer, which patent was also referred to by Mr. Chapman. The machine embodied mechanisms set forth in that patent No. 599,602, and also in the other patent referred to by Mr. Chapman, No. 600,883, March 22, 1898, Meyer and French. The commercial machine may also be fairly regarded as embodying mechanisms defined in the first two claims of the first patent referred to by Mr. Chapman, No. 463,982, November 24, 1891, Briggs.

I cannot, however, agree with Mr. Chapman that that machine embodied the mechanism set forth in the third claim of that Briggs

patent No. 463,982. The mechanism recited in that claim has never been incorporated in the Universal rounding and channeling machine at any time since that machine was produced, and is entirely different from the corresponding mechanism in the Universal machine.

Int. 30. State whether or not in rounders and channelers of the United Company in 1889 there were embodied the subjects-matter of any other patents of the United Company than those named by Mr. Chapman; if so, what were those patents?

Ans. The Briggs rounding machine, which, as I have stated, was superseded about 1896 by the Goodyear Universal rounding and channeling machine, was not organized to form extension edges. As I have heretofore explained fully in my deposition in regard to the out-sole stitching machine, about 1895 there was a radical change in methods of making shoes, owing to the fact that manufacturers began to make shoes with extension edges, and this occasioned a demand on the part of manufacturers for machines which would enable them to make by machinery these extension edge shoes which had previously been made by hand, so that only the more expensive shoes were provided with extension edges.

A number of inventors, including several not connected in any way with the Goodyear Shoe Machinery Company, went to work independently to solve the problem of providing a rounding and channeling machine which could be used in the manufacture of extension edge shoes. These inventors filed applications upon the mechanisms which they had produced for enabling a rounding and channeling machine to shape the soles of extension edge shoes, and there were numerous interferences in the Patent Office involving these applications. Two general types of mechanisms were developed by these inventors; one comprising a crease guide which was so incorporated in the organization of the rounding and channeling machine that it entered the crease between the welt and upper and was arranged to be moved to vary the position of the cut made by the rounding knife with relation to the edge of the last. The other type of mechanism for this purpose comprised two guides, one a crease guide which was stationary, and the other a guide for

engaging the upper above the crease guide and for varying the position of the shoe with relation to the rounding knife as required by the work. As I explained in my deposition regarding out-sole stitching machines, it is usually desired to form the extension edge around the forepart only, and it is also generally desired to provide the sole with a narrow edge in the shank.

I have for convenience used the expression "stationary crease guide" to distinguish it from the relatively movable upper guide in the second type of mechanism which I described. It should not, however, be inferred from this expression which I have adopted for convenience that the crease guide of the commercial machine has no movement.

In the Patent Office interference involving the combination of the crease guide and a relatively movable upper guide, which interferences involved the application for the Meyer and French patent No. 600,883, which was referred to by Mr. Chapman, priority of invention was awarded to Edward M. Cole, of Chicago, on whose application was issued patent No. 595,764, December 21, 1897, Cole. That patent was, after it was granted, assigned to the Goodyear Shoe Machinery Company. Typical claims of this Cole patent, which defined mechanisms which have always been embodied in the Goodyear Universal rounding and channeling machine, and which are embodied in machine No. 408 which is shown in the photograph Plaintiff's Exhibit 233, are claims 1 and 8, which are as follows: —

"1. A fixed guiding device for controlling the location of a shoe while being operated upon by rounding and channeling tools, an adjustable guiding device adapted to interpose so as to force the shoe farther from the said tools, and means for advancing and retracting said adjustable guiding device while the tools are in operation."

"8. In a machine for operation upon the soles of boots and shoes, two independent guides, one working along the shank portion, and the other around the fore part."

The other type of extension edge organization produced for rounding and channeling machines, that characterized by a single crease guide which was movable to locate the shoe properly in

relation to the rounding knife, was the subject-matter of interference in the Patent Office, in which interferences the application for the French and Meyer patent No. 600,883, which was referred to by Mr. Chapman, was also involved. In these interferences priority of invention was awarded to Frederick L. Alley, upon whose application was granted patent No. 625,663, May 23, 1899, Alley. The claims of the Alley patent which are directed to this single gauge organization do not set forth mechanism which is embodied in the commercial Goodyear rounding and channeling machine, but the Alley patent does contain several claims which set forth mechanism commercially used in that machine, and of these claims a typical claim is the following: —

"1. In a rough rounding and channeling machine, the combination with the throat plate, of a movable gauge forming an independently adjustable longitudional extension thereof, substantially as described."

Like the mechanism set forth in the claims of the Cole patent No. 595,764, to which I have referred, the mechanisms set forth in the first three claims of this Alley patent No. 625,633 have always been embodied in the commercial Goodyear Universal rough rounding and channeling machine and are embodied in machine No. 408, which is the machine shown in Plaintiff's Exhibit 233, as I have determined by an examination of that machine in the factory of the Commonwealth Shoe & Leather Company at Whitman.

The Goodyear Universal rounding and channeling machine as put out by the Goodyear Company prior to 1899, and by the United Company in 1899, also embodied the mechanisms defined in the claims of patent No. 630,339, August 8, 1899, French and Meyer. The mechanism of this patent constituted an improvement upon the mechanism shown, described and claimed in the patent No. 595,764, December 21, 1897, Cole, to which I have already referred.

This mechanism consisted in a cam which automatically determined the position of the upper guide with relation to the crease guide as the operation of the machine proceeded around the shoe.

Int. 31. State whether or not since 1899 there have been any

modifications or improvements in the rounders and channelers of the United Company. If so, what were they and what was their importance? If the same formed the subjects-matter of Letters Patent of the United Company, name the patents.

Ans. By far the most important advance made in the machine since 1899, has been the production in December, 1910, of a radically new and improved rounding and channeling machine known as "Rounding and Channeling Machine, Goodyear Universal, Model E", which was produced after several years of experimenting, as I shall later explain. Before discussing that machine, however, I will mention some improvements which were from time to time adopted in the Universal rounding and channeling machine as it was put out in 1899. These improvements enabled that machine to do certain kinds of work for which it had not been adapted prior to the adoption of the respective improvements.

The first of these improvements was a mechanism which was incorporated in the machine of 1900 and enabled the machine to prepare the sole for that kind of out-sole stitching which is known as "stitching aloft", and comprised means which could be actuated by the operator as the operation of the machine progressed around the shoe for throwing the channeling knife out of operation around the forepart. In making shoes in the manner which is known as "stitching aloft" it is usually desired that the stitches shall be located in a channel in the shank, but shall be placed upon the surface of the stock or in a groove in the forepart. This improvement is set forth in the claims of patent No. 579,144, March 23, 1897, Gifford, and No. 684,359, October 8, 1901, Eaton. Claim 3 of the Gifford patent, which defines this invention in broad terms, is as follows: —

"3. In a machine for operating upon the soles of boots and shoes, the combination of a movable trimming knife for operating upon the edge portion of the sole, a movable tool for operating upon the bottom of the sole, connected mechanisms for actuating the knife and tool, and means controlled by the operator for throwing the tool out of operation during the operation of the knife, substantially as described."

A typical claim of patent No. 684,359, all of the seven claims of

which describes this improvement, is claim 1, which is as follows: —

"1. In a rough rounding and channeling machine, the combination with a rounding knife, of a channeling knife, movable into and out of operation substantially in the plane of the bottom of the sole, substantially as described."

In 1903 mechanism was adopted by this machine which would enable all those manufacturers who desired to produce close edges around the forepart, as distinguished from extension edges, to round and channel their shoes upon this machine. That improvement is shown and is described in the claims of patent No. 845,-277, February 26, 1907, Thayer.

A typical claim of this patent is claim 1: —

"1. A sole rounding machine, having, in combination, a trimming knife, a shank guide, a forepart guide movable into and out of engagement with the shoe, and means for relatively moving the shank guide and trimming knife to allow the forepart of the sole to be trimmed closer to the upper than the shank portion, substantially as described."

In June, 1908, an improvement was made in the machine which had for its object the enabling of the operator to modify the operation of the automatic pattern cam, as the operation of the machine progressed around the forepart. This improvement is illustrated in the drawings and set forth in all of the ten claims of patent No. 1,010,854, December 5, 1911, Cady.

While this Goodyear Universal rounding and channeling machine was satisfactory to shoe manufacturers and was used very extensively after 1899, it was realized by experts of the United Company that the machine had serious defects which ought to be remedied. One of the most serious of these defects was that the cam, which, as I have explained, automatically controlled the position of the upper guide in relation to the crease guide, and so automatically positioned the shoe in the progress of the work, was adapted to operate properly only for a medium sized shoe, so that the machine was not organized properly to round and channel either sizes larger than the medium or sizes smaller than the medium. In the operation of the machine it was the practice for

operators to force the shoe ahead faster than it would normally be fed by the machine when operating upon a large size, and to hold a shoe back against the feeding operation when operating upon shoes smaller than the medium size. This defect of the machine imposed so great a burden upon the skill and judgment of the operator that the machine has always required for its operation the most skilled operators which are employed in shoe factories.

Another unsatisfactory feature of the Universal rounding and channeling machine, that is, the machine of 1899, was that whenever the shoes coming to the machine were to have their soles rounded with a different contour from those upon which the machine had been operating, it was necessary to change the cam which controlled the position of the upper guide, and this change, which, owing to the great variety in shapes desired for extension edge soles, had to be made frequently, required from seven to ten minutes' time, as the machine had really to be taken apart to some extent in order to substitute a cam which would be suited for the new class of work.

One of the company's inventors, Frederick H. Perry, explained to the company's officials and experts some ideas which he had for effecting substantial improvements in machines of this class. His plans were approved and he was authorized to proceed with the development of an entirely new rounding and channeling machine. His experimental work began in May, 1905, and had for its general objects the production of a machine which would operate at a higher speed than the Universal rounding and channeling machine, and which would, therefore, have an increased capacity over that machine, which would do better work than the 1899 machine and which would be more convenient for the operator.

Rounding and Channeling Machine — Model E, Goodyear Universal.

After several years of experimenting and the production of a number of experimental machines Mr. Perry succeeded in producing, in 1910, a machine which was commercially satisfactory, and the first machine was put out for commercial use in December,

1910, being known officially as "Rounding and Channeling Machine, Goodyear Universal, Model E". This machine ran at speed of 850 cuts per minute on the average, as compared with an average speed for the 1899 machine of about 650. This speed, combined with numerous improvements contributing to the convenience of the operator and saving much of his time which had been required in making adjustments to adapt the old machine for changes in the character of the work to be done, secured an average output for this model E machine of about 1500 pairs per day as compared with an average output for the 1899 machine of about 1200 pairs per day.

Among the improvements which contributed to this greatly increased capacity of the new model E machine was mechanism for automatically controlling the forepart guide to enable it to operate accurately for any size. As I have before explained, the mechanism of the 1899 machine which controlled the operation of the forepart guide, was adapted for one size only, that is, a medium size. The new model E machine was so organized that the machine could be instantly adapted for any size of shoe. This mechanism comprised a variable speed-driving mechanism for operating the pattern cam, which mechanism could be instantly set by the operator to adapt the machine so that the position of the forepart guide, which determines the distance of the rounding out from the edge of the last, would be right at a given point in the operation of the machine, whatever the size of the shoe. This mechanism is set forth in broad terms in the claims of patent No. 878,478, February 4, 1908, English, a patent which was acquired by the United Shoe Machinery Company in September, 1910, from Thomas G. Plant. Claim 51 of this patent is typical of the claims setting forth this improvement and is as follows: —

"51. In a rounding machine, a trimming knife, a guide co-operating therewith, means including a moving pattern to vary the relative position of said knife and guide to produce an extension on the edge of the sole, and a variable speed driving mechanism for the pattern."

The objection to the old machine, that is, the 1899 machine, that

so much time was required to change the machine when it had to operate upon shoes having edges of different contours from those on which it had been operating, when it was necessary for the operator to spend from seven to ten minutes in changing the pattern cam, as I have explained, were overcome in the new model E machine, the present commercial machine, by including in the organization of the machine 12 pattern cams of varying contours with means by which the mechanism for controlling the position of the upper guide could be changed from the control of one cam to the control of another cam in three seconds, as compared with the seven to ten minutes required for a corresponding change in the old machine. This improvement is set forth in many of the claims of patent No. 1,030,607, June 25, 1912, Perry (application filed December 11, 1908), of which claims 1 and 4 are typical.

"1. A machine for operating on the soles of shoes, having, in combination, a tool, a gauge, means for throwing the gauge into action during the relative travel of the tool about the shoe, a plurality of means for relatively actuating the tool and gauge, constructed and arranged to impart relative movements to the gauge and tool for shoes of different relative styles, and means for rendering any one of said means operative, substantially as described."

"4. A sole rounding or channeling machine, having, in combination, a knife, a gauge, means for throwing the gauge into action during the relative travel of the knife about the shoe, means for relatively actuating the gauge and knife comprising a plurality of cams and intermediate connections constructed and arranged to impart different relative movements to the gauge and knife for shoes of different styles, and means for rendering any one of said cams operative, substantially as described."

The first patent which disclosed mechanism comprising a plurality of cams each of which could be arranged to control the position of the forepart guide in a rounding and channeling machine was No. 682,679, September 17, 1901, Fowler, which patent is owned by the United Shoe Machinery Company. Claim 1 of this patent, which defines in general terms the improvement in the model E machine which I am discussing, is as follows: —

"1. A machine for operating on the soles of shoes, having, in combination, a suitable tool, a gauge, a plurality of means for relatively actuating the tool and gauge to vary the distance from the

inseam at which the tool acts on the sole, said plurality of means being constructed and arranged to impart different relative movements to the gauge and tool for shoes of different sizes or styles, and means for rendering any one of said means operative, substantially as described."

In the operation of the old rounding and channeling machine, that is, the machine of 1899, it was necessary for the operator after the operation of the machine upon one shoe had been finished, to manually adjust the mechanism for operating the pattern cam so that the pattern cam would reverse its movement in operating upon the next shoe, which would be a shoe for the other foot; that is, the pattern cam traveled in one direction for a right shoe, and in the opposite direction for a left shoe, and had to be reversed manually at the end of each operation. The convenience of the operator was greatly facilitated by an improvement in the new model E machine, which consists in means for automatically reversing the pattern mechanism at the end of the operation of the machine upon each shoe so that when the operator has finished one shoe the mechanism automatically adjusts itself for a proper operation upon the next shoe without the slightest thought or attention on the part of the operator.

This improvement is shown in the drawings and set forth in many of the claims of patent No. 1,030,606, June 25, 1912, Perry (application filed May 4, 1910), which patent illustrates in its drawings the machine in substantially its commercial form, although some improvements on which patents have not yet been granted are embodied in the commercial machine.

Of those claims which define the invention which I have just explained, typical claims are 18 and 22, which are of follows: —

"18. A machine for operating on shoe soles, having, in combination, a tool, a guide, pattern mechanism for relatively actuating the tool and guide to determine the path along which the tool operates, mechanism for actuating the pattern mechanism, and mechanism acting to automatically set the actuating mechanism to move the pattern mechanism alternately in opposite directions, substantially as described."

"22. A machine for operating on shoe soles, having, in combination, a tool, a guide, a pattern mechanism for relatively actu-

ating the tool and guide to determine the path along which the tool operates, mechanism for actuating the pattern mechanism in opposite directions for right and left shoes, and mechanism for alternately setting the actuating mechanism for right and left shoes, substantially as described."

An improvement in the machine which effected substantial economy for the manufacturer was the use of wood patterns instead of metal patterns which were used in the machine of 1899. The metal cams of the 1899 machine cost $1 each; the pattern cams for the model E machine, which are made of laminated wood, cost fifteen cents each. These wooden pattern cams are made from the pattern of the sole which it is desired to produce in the operation of the machine. The patterns are made by a machine known as "Generating Machine, Goodyear Pattern", which is set forth in general terms in the claims of patent No. 1,027,562, May 28, 1912, Perry (application filed February 12, 1908), and in patent No. 1,064,118, June 10, 1913, Allen (application filed October 11, 1909). A typical claim setting forth this mechanism is claim 29 of patent No. 1,027,562, which is as follows:—

"29. In a machine of the class described, means to be engaged movable and concurrently with a plurality of differently shaped regions of a model; and means controlled by said model engaging means to impart to the periphery of a disc a contour embodying the relative variations in contour of said engaged model regions."

I produce one of the metal pattern cams used on the 1899 machine which, as I have stated, costs $1. A different cam is required for every variation in the shape in the contour of the extension edge.

[*Metal pattern cam for 1899 machine was introduced in evidence and marked "Defendants' Exhibit 114".*

[*Answer to Int. 31 continued:*]

I also produce one of the laminated wood cams used on the model E rounding and channeling machine, the present commercial machine, which, as I have explained, costs fifteen cents each.

[*Wooden pattern cam for Universal rounding and channeling machine model E was introduced in evidence and marked "Defendants' Exhibit 115".*]

[*Answer to Int. 31 continued:*]

Another important improvement in the new model E rounding and channeling machine consisted in the mechanism for clamping the work between the cutter blade and the shoulder knife block. Such clamping of the work is characteristic of both the old machine, the 1899 machine, and the new model E machine, and in the old machine the operating mechanism for effecting this clamping was so organized that the pressure increased substantially when the work increased in thickness. This was very objectionable because during the movement of the channel knife block in the channel cutting operation the work is held clamped between the cutter plate and the channel knife block and a substantial increase in pressure increases the friction which must be overcome in the operation of the machine. This construction was further objectionable in the 1899 machine because, as I have already suggested, the operator of that machine, owing to the fact that the pattern cam was shaped only for a medium sized shoe, had to push on the shoe all the time when he was operating upon a larger shoe, and had to pull back on the shoe all the time that he was operating upon a smaller sized shoe, and this pushing and pulling was exerted against the stress of the strong spring which caused the clamping of the work between the channel knife block and the cutter plate. In the new model E machine the pressure exerted in this clamping of the stock is uniform whatever the thickness of the stock, and the convenience of the operator is greatly facilitated by this improvement. Among the claims in patent No. 1,030,606, June 25, 1912, Perry (application filed May 4, 1910), which set forth this invention, a typical claim is 35, which is as follows: —

"35. A machine for operating on shoe soles, having, in combination, a sole support, and a spring for holding the support against the sole of a shoe arranged to maintain a substantially constant pressure upon soles of varying thickness, substantially as described."

In addition to the several improvements to which I have specifically referred, it should be stated that the general organization of this new model E machine is adapted to afford every convenience

to the operator in the use of the machine, and particularly to save the operator's time which, in the use of the old machine of 1899, had to be devoted so largely to adjusting or changing the machine to adapt it for changing conditions in the work. In the new model E machine every possible variety of the work is provided for in the machine as regularly constructed. To adapt the machine from one class of work to an entirely different class of work the operator needs only to effect a quick adjustment which is provided for in the machine, while, in changing the 1899 machine to adapt it for any special kind of work, it was frequently necessary to put an attachment on the machine which, when it was on the machine, limited the utility of the machine to the special class of work for which the attachment was intended, and which, when the operator had finished that special work, must be removed before the machine could be used for any other class of work.

The commercial model E machine is constructed substantially as shown in patent No. 1,030,606, June 25, 1912 (application filed May 4, 1910). All of the 61 claims in that patent set forth mechanisms which were incorporated in the machine until September, 1912, at which date the features covered by claims 1 to 17 of the patent were discontinued as it was found that the mechanism set forth in those claims was no longer needed under commercial conditions. Twenty-five of the 31 claims of patent No. 1,030,607, June 25, 1912, Perry (application filed December 11, 1906), also set forth mechanisms which are embodied in the commercial model E machine. The subject-matter of the other six claims of that patent, which, although of later number than No. 1,030,606, shows an earlier stage in the development of the machine, were superseded by improved mechanisms as shown and defined in the claims of patent No. 1,030,606.

The commercial model E rounding and channeling machine embodies mechanisms defined in the claims of the following patents: —

No. 579,144, March 23, 1897, Gifford.

No. 595,764, December 21, 1897, Cole.

No. 599,602, February 22, 1898, Meyer and French.

No. 600,883, March 22, 1898, French and Meyer.
No. 625,633, May 23, 1899, Alley.
No. 630,338, August 8, 1899, French and Meyer.
No. 630,339, August 8, 1899, French and Meyer.
No. 682,679, September 17, 1901, Fowler.
No. 808,628, January 2, 1906, Brainard.
No. 845,277, February 26, 1907, Thayer.
No. 878,475, February 4, 1908, Alley.
No. 878,478, February 4, 1908, English.
No. 1,030,607, June 25, 1912, Perry (Application filed December 11, 1908).
No. 1,030,606, June 25, 1912, Perry (Application filed May 4, 1910).

Model E rounding and channeling machine has been very successful. It has entirely superseded the machine of 1899, that is, the Goodyear Universal rounding and channeling machine. Eight hundred and thirty-two of these machines were in shoe factories on September 1, 1913. It should be noted that one of these machines can easily round and channel shoes enough to run four welting machines to their capacity. The number of these model E machines out on September 1, 1913, may be compared with the 230 Universal rounding and channeling machines which were in use in February, 1899.

This machine is put out by the United Shoe Machinery Company, through its Goodyear department.

Mr. WEBSTER. Please note the petitioner's objection to all that portion of the answer which relates to what others said, did, or thought; also all that portion which relates directly or indirectly to patents and mechanisms of patents shown in patents issued after the date of the filing of the petition herein, all the same being incompetent, inadmissible, and having no bearing on the questions involved in this case.

Int. 32. Have you, at the request of counsel, collected in a volume the patents referred to by you as relating to rough rounding and channeling machines?

Ans. I have, and I now produce a volume including copies of

all of the patents to which I referred in my deposition. The rounding and channeling machine is and has been since February, 1899, put out by the United Shoe Machinery Company through its Goodyear department.

[*Volume of patents produced by the witness is offered in evidence and marked "Defendants' Exhibit 116".*]

Mr. WEBSTER. The petitioner objects to the introduction of all patents dated after the date of the filing of the petition herein.

Int. 33. Will you please state the number, date and name of the patentee of each of the patents contained in the volume Exhibit 116?

Ans. No. 463,982, November 24, 1891, Briggs.
No. 511,263, December 19, 1893, Briggs and Dancel.
No. 579,144, March 23, 1897, Gifford.
No. 595,764, December 21, 1897, Cole.
No. 599,602, February 22, 1898, French and Meyer.
No. 600,883, March 22, 1898, Meyer and French.
No. 625,633, May 23, 1899, Alley.
No. 630,339, August 8, 1899, French and Meyer.
No. 682,679, September 17, 1901, Fowler.
No. 684,359, October 8, 1901, Eaton.

BOSTON, MASS., October 8, 1913.

INSOLE CHANNELING MACHINES.

Int. 34. What is the function of an insole channeler in the manufacture of shoes?

Ans. An insole channeler is used to prepare the insole of a welt shoe for the lasting and welt-sewing operations, and is also with somewhat different organization used for preparing the soles of turned shoes for the lasting and sewing operations. In operating upon a welt insole, the insole channeler makes on the flesh side of the insole two cuts, one extending from the edge of the insole inward toward the middle of the sole, and the other beginning inside of the edge and extending downwardly and obliquely toward the first cut. These two cuts together define and produce the "between substance" to which the welt and upper are secured in the welt-sewing operation. Before the lasting and welt-sewing operations the lip formed by the outer cut is turned up and back. In operating upon a turn sole the machine makes an inner cut or slit substantially like the corresponding cut or slit made in channeling the welt insole. But the operation at and adjacent to the edge of the turn sole differs from the operation upon the welt insole in that the stock at the edge of a turn sole from the beginning of the cut to its end and extending from the end of the cut to the face of the flesh side is entirely removed, thus leaving a shoulder to which the upper is secured in the subsequent operation of sewing the upper of a turn shoe while the shoe is wrong side out. I produce a welt insole and a turn sole which have been operated upon by an insole channeling machine in the manner above indicated.

[*Channeled welt insole introduced in evidence, and marked "Defendants' Exhibit 117".*

Also channeled turn sole introduced in evidence, and marked "Defendants' Exhibit 118".]

Int. 35. Mr. Chapman, in his answers to questions 62, 63 and 64, compares the cut on page 95 of Plaintiff's Exhibit No. 220 with the insole channeling machine shown in the photograph in Plain-

tiff's Exhibit 235. What is the machine shown in Plaintiff's Exhibit 235, and have you examined the same in the Whitman factory; if so, is that machine now the same as when it was leased to the Commonwealth Shoe Company by the Goodyear Company, and what have you to say as to the accuracy of Mr. Chapman's comparison of that machine with the cut on page 95 of Plaintiff's Exhibit No. 220?

Ans. I have examined the channeling machine No. 2072 which is in the Whitman factory of the Commonwealth Shoe & Leather Company, and have compared that machine with the photograph of Plaintiff's Exhibit No. 235, and find that that machine No. 2072 is accurately represented in the photograph. That photograph, Plaintiff's Exhibit 235, shows the Goodyear insole channeling machine as it was put out shortly before February, 1899, by the Goodyear Shoe Machinery Company and after that date by the United Shoe Machinery Company. That photograph, however, does not accurately represent machine No. 2072 as it was leased to the Commonwealth Shoe & Leather Company by the Goodyear Shoe Machinery Company on February 8, 1893.

When the machine was leased on that date it was constructed as shown in the cut on page 95 of Plaintiff's Exhibit No. 220, which is the Goodyear Shoe Machinery Company catalogue of January 1, 1897. The machine as it now stands is substantially different from the machine shown in that cut, and the present organization of the machine is accurately shown in patent No. 550,402 November 26, 1895, Beckman, and as set forth in claims 4, 5 and 6 of that patent.

At the time machine No. 2072 was leased to the Commonwealth Shoe & Leather Company the mechanism shown in Beckman patent No. 550,402, of November 26, 1895, had not been produced. I shall later explain the advantages of the construction defined in the claims of this Beckman patent and at the same time explain the defects of the machine constructed as it was when leased to the Commonwealth Shoe & Leather Company, which defects were overcome by the improvements of the Beckman patent.

I will state now, however, that the machine of the cut on page 95 of Complainant's Exhibit No. 220, Goodyear Catalogue of 1897,

was obsolete before the formation of the United Shoe Machinery Company in 1899, and the United Company have never put out a machine as shown in that cut.

When I examined machine No. 2072 at the Whitman factory the machine was idle. In my examination I found that, as Mr. Chapman has stated, the machine was equipped for special work; that is, channeling felt insole. That is certainly a very specialized kind of work. The machine is not used in the Commonwealth Shoe & Leather Company factory for channeling leather insoles, and I observed two of the United Company's present commercial channeling insole machines known as "Channeling Machine, Goodyear Universal", which were being operated near the machine of Complainant's Exhibit No. 235, and those machines were being operated to full capacity in the channeling of regular welt insoles. All of the all-leather welt insoles which are used in that factory are channeled on these two new machines. None of that work, as I have stated, is done on the machine of Plaintiff's Exhibit 235.

As to the accuracy of Mr. Chapman's comparison of the machine of Plaintiff's Exhibit No. 235 with the cut on page 95 of Plaintiff's Exhibit 220, Goodyear catalogue of 1897, I am obliged to state that his comparison seems to me rather superficial and inaccurate, as might be expected from the comparison of a machine with a catalogue cut, inasmuch as Mr. Chapman failed to note the important improvements defined in claims 4 and 5 of the Beckman patent No. 550,402, November 26, 1895.

Mr. WEBSTER. Please note petitioner's objection to the answer because of the same being largely in the nature of argument, and the argumentative portion is objected to and notice given that petitioner will move to strike out the same hereafter.

Int. 36. It is not clear to me whether or not the mechanism of the Beckman patent to which you refer was embodied in the insole channeler as constructed in 1899. I will, therefore, ask you what patent, if any, of the United Company showed and described mechanism embodied in that machine as the same was constructed in 1899?

CHANNELING MACHINE: GOODYEAR (INSOLE AND OUTSOLE).

Ans. I should have stated in my preceding answer that the insole channeling machine put out by the Goodyear Shoe Machinery Company just prior to February, 1899, and by the United Company after that time, was constructed specifically as shown in the drawings and set forth in the claims of patent No. 550,402, November 26, 1895, Beckman. When the machine was used for channeling welt insoles it embodied the mechanism set forth in claims 4, 5 and 6 of this patent. When the machine was used for channeling turn soles, it embodied the mechanisms set forth in all six of the claims of the patent.

In explaining the advantages of the improvements shown in the drawings and set forth in the claims of the Beckman patent No. 550,402, it is necessary, first, to refer to the defects in the prior machine; that is, the machine as it was put out before the improvements of the Beckman patent were made and incorporated in the machine. That prior machine, which is the machine shown on page 95 of Plaintiff's Exhibit No. 220, Goodyear Company catalogue of 1897, did not do its work properly in going around the toe of an insole. This difficulty was greatly increased with the introduction about 1895 of narrow-toed lasts. The radical changes which have marked the development of modern lasts began about that time, and the first step in that development was the use of narrow-toed lasts which required insoles such as that shown in Fig. 10 on sheet 4 of the drawings of the Beckman patent No. 550,402. It was very difficult, and in fact impracticable, in the commercial manufacture of shoes to channel insoles, such as represented in Fig. 10 of the drawings of the Beckman patent, upon the old machine; that is, the machine shown on page 95 of Plaintiff's Exhibit 220, Goodyear Company's catalogue of 1897. These defects were overcome in the machine of 1899, embodying the mechanisms set forth in claims 4, 5 and 6 of Beckman patent No. 550,402. Of this group of claims a typical claim is 4:—

"4. In a sole channeling machine, the combination with a shoulder knife, of a channeling knife and laterally adjustable

presser-foot, and means for changing the relative lateral position of the shoulder knife and channeling knife, substantially as described."

The improvement defined in the above claim made it possible to channel successfully all shapes of toes as required for shoes made on the modern lasts, the development of which, as I have stated, dates from about 1895.

When the machine shown on page 95 of Plaintiff's Exhibit 220, Goodyear Company catalogue of 1897, was used in channeling turn soles, its operation was unsatisfactory because the edge of the sole frequently varied in thickness after the operation of the machine. It is highly important that the "feather edge" of a turn sole, such as shown in Defendants' Exhibit 118, be uniform in thickness all around the shank and forepart, as that edge is visible and prominent in the finished shoe. The old machine was not properly organized to insure the desired uniformity in the feather edge of a turn sole. The organization set forth in claims 1, 2 and 3 of Beckman patent No. 550,402, of November 26, 1895, which was, as I have stated, embodied in the commercial insole channeling machine of 1899 when that machine was used for channeling turn soles, enabled that machine to produce a feather edge on the turn sole which was always of uniform thickness.

Summarizing my discussion of the commercial insole channeling machine of 1899 and its relation to the machine which preceded it, I can state without hesitation that the old machine shown in the cut on page 95 of Plaintiff's Exhibit 220 could not have performed satisfactorily the work which has been required for insole channelers and turn sole channelers during the past fifteen years.

Int. 37. What has been the development in the matter of insole channelers put out by the United Company since 1899? If any new machines, or modifications of old ones, have been introduced, state what they were, and if embodying the subjects-matter of any Letters Patent of the United Company, name the patents.

CHANNELING MACHINE: GOODYEAR UNIVERSAL (WELT WORK).

Ans. The commercial insole and turn sole channeling machine of 1899, the machine shown in Plaintiff's Exhibit 235, was superseded in 1907 by a machine officially known as "Channeling Machine, Goodyear Universal", which is at present, and has been since that date, the standard commercial insole channeling machine of the United Company. The machine was first put into commercial use on welt work in September, 1907, and was first put into use on turn work in November, 1908.

This new machine, the present standard commercial channeling machine for welt insoles and turn soles, was produced after a long period of experimenting which began soon after the formation of the United Company, in the endeavor to provide a machine which would have much greater capacity than the 1899 machine, and which would at the same time do better work, and particularly would avoid occasional mutilation of the work which sometimes occurred in the operation of the 1899 machine.

The 1899 machine was limited in its capacity because it was hand operated. It was sometimes provided with what was known as a "power attachment", as is shown in Plaintiff's Exhibit 235, but this power attachment did not make the machine a power-operated machine, since it involved continuous manual operation by the workman of the crank which is shown at the right in that photograph, Plaintiff's Exhibit 235. The problem of operating an insole channeling machine by power proved a serious one for the United Company's inventors, because, while it is permissible and desirable to operate the machine at high speed along the straighter portions of the work, it is usually preferred and required for some classes of work that the operation be performed more slowly around sharply curved portions of the sole, as at the toe.

The problem of operating an insole channeling machine by power was solved in the machine which was produced in 1907, and which, as I have said, is the present standard commercial machine put out by the United Company, by the mechanism shown in the drawings, described in the specification and set forth in the claims of patent

No. 1,023,801, April 23, 1912, Bertrand (application filed April 30, 1908), which shows and describes the machine substantially as it is constructed and put out for channeling welt insoles. The solution of that problem of operating the machine by power, and at the same time permitting of slower operation around the toe is set forth in many of the claims of this patent No. 1,023,801, of which a typical claim is the second.

Mr. WEBSTER. Please note at this point objection of counsel for petitioner to introduction of patents or reference to patents issued after the date of filing of the petition herein, as having no reference to the questions involved in this cause.

[*Answer to Int. 37 continued:*]

Claim 2 of this patent No. 1,023,801, the application for which was filed, as I have stated, on April 30, 1908, is as follows:—

"2. A power channeling machine, having, in combination, a work table for supporting a flat sole and over which the sole is fed, a lip forming cutter supported opposite said table, a reciprocatory head, a work feeding foot sustained thereby for engaging the sole adjacent the point of operation of said cutter means for reciprocating said head to feed the sole step by step constructed and arranged to provide a relatively high speed of work feed, and provision for slowing down the speed of work feed a substantial amount during the operation of the machine and while cutting around the toe to facilitate the guiding of the sole by the operator relatively to the cutter."

The specific construction of the work-feeding mechanism of this new channeling machine, the present commercial machine, comprised means which clamped the stock on opposite sides and fed it forward between successive cutting operations of the channeling knives. The problem of reducing the speed of the machine's operations around the toe was ingeniously solved by mechanism under control of the operator and arranged for convenient operation by him, which shortened the feeding stroke of the work-engaging clamps. This mechanism permits wide variations in the length of the feed from the maximum down to nothing. It may be interesting note that, during the time that I observed the operation of the two Universal channeling machines in the Whitman factory of the Commonwealth Shoe & Leather Company, a large number of

insoles were channeled by the operators of the two machines, and in cutting around the toe, in every insole operated upon by the machines while I was observing them, the operator of each machine manipulated the feed-controlling mechanism to reduce substantially the speed of the work-feed around the toe.

This improved work-feeding mechanism of the new insole channeling machines of 1907 had a further distinct advantage over the feeding mechanism of the 1899 machine in that there was no liability of mutilating the stock during the operation of the machine. As will be noted on inspection of the drawings of Beckman patent No. 550,402, November 26, 1905, and inspection of Plaintiff's Exhibit 235, both of which show the commercial insole channeling machine of 1899, the work was fed into that machine by a toothed wheel which operated between the two channeling knives. This feed wheel operated by digging its teeth into the stock, and as the portion of the stock engaged by it was the "between substance" which was subsequently to receive the stitch in the operation of attaching the welt of a shoe, or attaching the upper of a turn shoe, and as it constituted the only means which secures the upper to the insole of a welt shoe, or to the sole of a turn shoe, it is obvious that such mutilation of this "between substance" as would impair its thread-holding power would be very objectionable as its thread holding would be weakened, with the result that the seam might give way in the wear of the shoe. The operation of this feed wheel caused the greatest difficulty in channeling around the toe. In operating at the toe the shoe must be turned to permit the knives to travel in curved paths around the toe and this turning must take place while the teeth of the feed wheel are engaged with and sunk into the "between substance". The liability of mutilating the "between substance" under these conditions is obvious. All this trouble was entirely obviated in the new Universal machine introduced in 1907.

This improved feeding mechanism was combined in the Universal machine of 1907 with vibrating knives which cut the two channels by a backward movement after the sole had been fed. In the old machine of 1899 stationary knives were employed and the toothed

feed wheel had to feed the sole forward against the two knives. The danger of the mutilation of the stock to which I have referred was, of course, greatly increased by this organization of the 1899 machine.

Combined with this organization of clamp-feeding mechanism and vibrating knives was a work retainer arranged to clamp the work during the backward cutting stroke of the knives. Many of the claims of patent No. 1,023,801, April 23, 1912, Bertrand, granted on application filed April 30, 1908, were directed to this point. Of these claims, the tenth is typical: —

"10. In a stock fitting machine for channeling soles, the combination with a feather edge forming knife and a channel forming knife, of means to reciprocate said knives and the work together in one direction to feed the work, and means to thereafter clamp the work against movement while said knives move backwardly to form the feather edge and channel."

I have endeavored to point out only some of the most striking improvement sincorporated in this Goodyear Universal channeling machine as the machine was organized for welt work. The improvements which I have mentioned, together with others, are defined in the claims of the following patents, all owned by the United Shoe Machinery Company: —

No. 644,571, March 6, 1900, Beckman.

No. 952,701, March 22, 1910, Eppler.

No. 984,772, February 21, 1911, Meyer.

No. 984,773, February 21, 1911, Meyer.

No. 989,142, April 11, 1911, Gordon.

No. 1,023,801, April 23, 1912, Bertrand (application filed April 30, 1908).

No. 1,030,703, June 25, 1912, Bertrand (application filed March 24, 1909).

No. 1,030,706, June 25, 1912, Bertrand (application filed April 15, 1911).

No. 1,030,708, June 25, 1912, Bertrand (application filed June 24, 1911).

No. 1,030,802, June 25, 1912, Bertrand (application filed May 16, 1910).

CHANNELING MACHINE: GOODYEAR UNIVERSAL (TURN WORK).

When a channeling machine is used for turn work a somewhat different organization is required from that which equips the machine for welt work. However, the Goodyear Universal channeling machine for turn work is, in general, substantially organized like the machine when equipped for welt work, and the machine equipped for turn work embodies the mechanisms set forth in the list of patents which I have just named excepting patent No. 989,142, April 11, 1911, Gordon, and excepting also the last three on the list.

Substituted for the mechanisms set forth in the claims of those four patents are mechanisms which adapt the organization of the machine for the channeling of turn soles and which are set forth in the claims of the following patents, all of which are owned by the United Company: —

Reissue No. 13,375, February 27, 1912, Prenzel (original patent No. 965,656, July 26, 1910).

Patent No. 1,030,536, June 25, 1912, Prenzel (application filed April 20, 1911).

No. 1,030,704, June 25, 1912, Bertrand (application filed May 10, 1909).

No. 1,030,710, June 25, 1912, Bertrand (application filed July 24, 1911).

While all of the improvements set forth in the list of patents which I have just enumerated are important and contributed to the success of the Goodyear Universal channeling machine on turn work, attention should perhaps be called particularly to the improvement defined in patent No. 1,030,704, June 25, 1912, Bertrand (application filed May 10, 1909).

In machines for channeling welt insoles or turn soles means for engaging the edge of the sole and properly locating it for the operation of the channeling knives has been found indispensable. It is important that this means should be operative at a point on the sole adjacent to the position where the knives are performing their cutting operation. In the Universal machine, therefore, in which

the knives vibrate, the means for engaging the edge of the sole, which may conveniently be called an edge gauge, is mounted to vibrate with the knives so that it is always adjacent to their cutting edges. In the experimental work directed to adapting this Universal channeling machine for turn work it was found that it was not practicable to move the edge gauge in a line parallel with the path of travel of the knives, because in operating upon the curved portions of a turn sole there was danger that the edge gauge would crowd the feather edge of the sole and mutilate it. As I have explained, it is important that the edge of a turn sole be in perfect condition after the channeling operation, because this edge is visible in the finished shoe. It was to obviate this danger of injuring the sole by the edge gauge that the improvement of patent 1,030,704 was incorporated in the machine. This improved organization comprised means for moving the edge gauge slightly away from the knives in the backward movement of the knives and edge gauge, thus permitting clearance between the edge gauge and edge of the sole in operating upon curved portions of the sole. The problem and its solution are indicated in Fig. 6 of the drawings of the Bertrand patent No. 1,030,704. All of the twenty-two claims of the patent are directed to mechanisms embodied in the commercial machine for turn work and are, most of them, directed to the organization which I have been discussing. A typical claim is 8:

"8. A channeling machine, having, in combination, a support for a flat sole, work feeding devices for engaging the face of the sole, an edge gauge, an automatic means for imparting a relative separating movement to said gauge and devices across the line of feed to relieve the pressure of the sole on the gauge, substantially as described."

The Universal channeling machine which, as I have stated, was introduced in 1907 for welt work and in 1908 for turn work has superseded the machine of 1899, the machine shown in Plaintiff's Exhibit 235, for both welt insole and turn channeling. Of the new machines 1094 were put out in the four years between March 1, 1909, and March 1, 1913, the latter date being the end of the United Company's last fiscal year. The Universal machine has a capacity for both welt insole work and turn sole work of from 10

to 25 per cent more than the 1899 machine. One of the new machines will channel enough soles to provide for the operation of three or four welt and turn sewing machines.

Int. 38. Have you collected in a volume the patents referred to by you in your testimony as relating to insole channeling machines?

Ans. I have and I now produce this volume [*producing volume*].

[*Volume of patents introduced in evidence, and marked "Defendants' Exhibit 119".*]

Mr. WEBSTER. Please note the petitioner's objection to introduction of any patents issued after the date of the filing of petition herein, on the ground that the same has no bearing with reference to any matters involved in this cause, and such patents are irrelevant, inadmissible and incompetent.

Int. 39. Will you please state the number, date, name of patentee of each of the patents contained in that volume, Defendants' Exhibit 119?

Ans. [*Reading.*]

No. 644,571, March 7, 1900, Beckman.

No. 952,701, March 22, 1910, Eppler.

No. 965,656, July 26, 1910, Prenzel.

Reissue No. 13,375, reissued February 27, 1912, Prenzel.

No. 984,772, February 21, 1911, Meyer.

No. 984,773, February 21, 1911, Meyer.

No. 989,142, April 11, 1911, Gordon.

No. 1,023,801, April 23, 1912, Bertrand (application filed April 30, 1908).

No. 1,030,536, June 25, 1912, Prenzel (application filed April 20, 1911).

No. 1,030,703, June 25, 1912, Bertrand (application filed March 24, 1909).

No. 1,030,710, June 25, 1912, Bertrand (application filed July 24, 1911).

No. 1,030,802, June 25, 1912, Bertrand (application filed May 16, 1910).

The Universal channeling machine is put out by the United Company through its Goodyear department.

GOODYEAR OUTSOLE CHANNELING MACHINE.

Int. 40. In his answers to questions 65 and 66, Mr. Chapman refers to an out-sole channeler which he saw at the Whitman factory and compares it with what is illustrated on page 108 of Plaintiff's Exhibit 220. For what work in shoe manufacturing was the out-sole channeler at the Whitman factory, and that shown on page 108 of the catalogue, intended? What was its importance as a machine, and to what extent has it been employed to do the work for which it was designed?

Ans. The Goodyear out-sole channeler is a very old machine which, when it was active, was used for channeling the out-soles of welt shoes. Before there was introduced into the industry the rounding and channeling machine, it was the practice to shape out-soles of welt shoes in one or two ways. The workmen would either tack on the shoe the out-sole, trim it by hand to the desired contour, then remove it from the shoe and channel it upon the Goodyear out-sole channeler, or he would die out the out-sole with a die and channel it upon the Goodyear out-sole channeler before applying it at all to the shoe. When the rounding and channeling machine went into use these old methods of channeling out-soles became obsolete and the Goodyear out-sole channeler became obsolete as a machine for use in the manufacture of welt shoes at the same time.

As to the reasons why the old methods of channeling out-soles have been superseded by the rounding and channeling machine, it is difficult to locate properly upon the bottom of a welt shoe a sole which has previously been shaped to the contour desired for the sole of the finished shoe. The sole of a welt shoe has to be applied to the botton of a shoe, after, of course, the welt has been attached

and when the welt is extended laterally from the shoe all around the shoe in front of its heel end.

The outline of the shoe bottom defined by the edge of the laterally extending welt is larger than a sole that has been given the desired shape for the sole in the finished shoe, and it is difficult to locate properly the sole under these conditions. So far as I know, no customer of the United Company attempts to shape the out-soles of welt shoes before they are attached to the shoe. The rounding and channeling machine, as I have explained in my previous testimony, shapes the sole after it has been cemented to the shoe and imparts the shape in accordance with the shape of the last. At the same time it is very economical to use the rounding and channeling machine because it performs simultaneously two operations which, before its introduction, had to be performed separately; that is, the shaping of the sole and the forming of the channel which is to receive the out-seam.

For the reasons which I have stated there is, under modern conditions of shoe making, no place in a welt shoe factory for the Goodyear out-sole channeling machine, as a machine for use on welt shoes. This machine became inactive before the United Company was formed, and such small demand for the machine as there has been since the company was formed has been for special work.

Int. 41. Have you examined the machine at the Whitman factory; and, if so, for what purpose is it now used?

Ans. I have examined at the Whitman factory the machine which has been referred to by Mr. Chapman. As he stated, the machine is constructed substantially as shown in the cut on page 108 of Plaintiff's Exhibit 220, which is the Goodyear Shoe Machinery Company catalogue of 1897. When I saw this machine at the Whitman factory it was idle. The machine was equipped for special work, that is, for forming grooves in the bottom of the channels of out-soles for McKay sewed or standard screw shoes.

That machine is never used in the Whitman factory upon welt work of any kind. The out-soles of all welt shoes made in the Whitman factory are channeled on the Universal rounding and channeling machine at the same time that the sole is shaped.

There are ten Universal rounding and channeling machines in that factory, of which one is the new model E which I have discussed in my previous testimony.

Int. 42. How many Goodyear out-sole channeling machines like that shown on page 108 of Plaintiff's Exhibit 220 have ever been put into shoe factories by the United Company?

Ans. Seven.

LEVELING MACHINE: GOODYEAR AUTOMATIC SOLE.

Int. 43. Please explain the function of a leveling machine in the manufacture of shoes, and state the class of work for which the Goodyear automatic sole-leveling machine is used.

Ans. A leveling machine is used to give to the bottom of the sole of a shoe the shape desired in the finished shoe. The operation is performed after the sole has been attached and the desired shape is imparted to the sole by pressure. In the manufacture of welt shoes it is the practice to impart this pressure by means of a vibrating roll which is moved relatively to the shoe in such manner that it operates successively upon different portions of the sole. The Goodyear automatic sole-leveling machine is a machine of the vibrating roll type which is used exclusively for leveling the soles of welt shoes.

Int. 44. What was the first patent definitely directed to an automatic sole-leveling machine of the vibrating roll type?

Ans. An automatic sole-leveling machine of this type was for the first time shown in the drawings and described in the claims of patent No. 540,222, May 28, 1895, Winkley and Phillips.

The nature of the advance in the art represented by this patent may be indicated by quoting the first claim of the patent, which is as follows: —

"1. In a sole leveling machine, the combination of a vibrating leveling roll, a shoe supporting jack, and connected mechanism operating automatically to change the relative longitudinal position and lateral inclination of the roll and jack, substantially as decribed."

The machine shown in this patent was thoroughly automatic. The operator could, if he desired, after putting a shoe into posi-

tion for the operation of the machine and starting the machine, go away and leave it and when he came back he would find that the leveling operation had been completed by the machine, that the machine had stopped and that the shoe had been presented by the machine in proper position for its convenient removal and the substitution of another machine.

Int. 45. In his answers to questions 67 and 68 Mr. Chapman compared the machine of Plaintiff's Exhibit 234 with the cut on page 28 of Plaintiff's Exhibit No. 190, being the United Shoe Machinery Company's catalogue of 1902. What machine is shown on page 28, and when was that machine first put into use?

Ans. The cut on page 28 of Plaintiff's Exhibit 190, being the United Shoe Machinery Company's catalogue of 1902, shows the Goodyear automatic leveling machine as it was first put out for commercial use about 1896, and also correctly represents the machine as it was put out for commercial use in 1899. The machine shown in Plaintiff's Exhibit No. 234, which is No. 35, was leased to the Commonwealth Shoe and Leather Company by the Goodyear Shoe Machinery Company on May 26, 1897. I have examined the Goodyear automatic leveling machine No. 35, of which Plaintiff's Exhibit 234 is a photograph, and I find that that machine is not now in the condition in which it was leased by the Goodyear Company in 1897. The work-supporting mechanism which is shown in that photograph was of a type which was not adopted for commercial use until 1900, and that mechanism was substituted in the machine of Plaintiff's Exhibit 234 for the type of work-supporting mechanism which was commercially used prior to 1900, and which is that shown in the cut on page 28 of Plaintiff's Exhibit 190. The work-supporting mechanism now on the machine shown in Plaintiff's Exhibit 234 is illustrated in drawings and described in the specification set forth in the claims of patent No. 677,550, July 2, 1901, Meyer. Mr. Chapman apparently failed to note this difference between the work-supporting mechanism which is plainly shown in Exhibit No. 234 and the work-supporting mechanism which is also plainly shown in the cut on page 28 of Plaintiff's Exhibit 190.

Int. 46. If the subjects-matter of any patent of the United Company were embodied in the Goodyear automatic leveling machine as put out by the United Company in 1899, please name those patents and state briefly their relation to that machine.

Ans. The commercial Goodyear automatic leveling machine as put out in 1899 embodied mechanisms sets forth in the claims of the following patents, all owned or controlled by the United Shoe Machinery Company: —

No. 540,222, May 28, 1895, Winkley and Phillips.
No. 540,223, May 28, 1895, Winkley and Phillips.
No. 541,988, July 2, 1895, Winkley.
No. 546,211, September 10, 1895, Winkley and Phillips.
No. 555,548, March 3, 1896, Winkley.
No. 580,746, April 13, 1897, Winkley.
No. 610,314, September 6, 1898, Winkley.

Of these patents the first one, No. 540,222, was, as I have already stated, the first patent directed to an automatic leveling machine of the vibrating-roll type. I have already quoted a typical claim of that patent. The machine shown in the drawings of this patent, however, was not commercially used, but was an experimental machine which constituted one of the steps toward the development of the commercial machine which was constructed as shown and described in patent No. 555,548, March 3, 1896, Winkley. The commercial machine of 1899 embodied the mechanism set forth in all twelve of the claims of that patent No. 555,548, of which a typical claim is the eighth: —

"8. In a sole leveling machine, the combination of a pair of shoe supporting jacks, a leveling roll associated with each jack, means for relatively actuating one jack and its associated roll to level a right shoe, and the other jack and its associated roll to level a left shoe, and connected mechanism operating automatically to regulate the relative movement of each jack and its associated roll to shape the forepart and shank of a shoe independent of each other, substantially as described."

While this machine did not reach the stage of its development at which it was commercially successful until there were incorporated in it the improvements of the patent No. 555,548, to which I

have just referred, important steps in its development are represented in earlier patents and valuable improvements are set forth in the claims of those patents. For example, the commercial machine of 1899 embodied the mechanism set forth in all of the nineteen claims of patent No. 540,223, May 28, 1895, Winkley and Phillips. A typical claim of this patent is the first: —

"1. In a sole leveling machine, the combination of two shoe supporting jacks, a vibrating leveling roll, associated with each jack, and means common to both jacks for automatically presenting each jack independently to its associated roll when the jack is brought into operative position, substantially as described."

Further substantial advance toward the commercial machine of 1899 is represented by patent No. 541,988, July 2, 1895, Winkley, all five claims of which set forth mechanism embodied in the commercial machine. A typical claim is the first: —

"1. In a sole leveling machine the combination of a vibrating leveling roll, a shoe supporting jack, connected mechanism for relatively actuating roll and jack to level the sole of a shoe placed upon the jack, and an automatically operating adjusting device connected with said actuating mechanism whereby the same is operated to shape the shank and forepart of a sole independently of each other, substantially as described."

Int. 47. Please state whether or not since February, 1899, any improvements have been embodied in the Goodyear automatic leveling machine put out by the United Company. If so, state what they were, the reasons why they were introduced, and explain their importance in the industry.

Ans. Since February, 1899, many important improvements have been embodied in the Goodyear automatic sole-leveling machine as put out by the United Company. The first improvement was the work-supporting mechanism shown in patent No. 677,550, July 2, 1901, Meyer, and defined in the claims of that patent. This improvement was adopted in 1900, and, as I have already explained, the machine of Plaintiff's Exhibit No. 234 at the Whitman factory of the Commonwealth Shoe & Leather Company is now provided with the work-supporting mechanism of this patent No. 677,550, which was substituted on the machine of Plaintiff's Exhibit No.

234 for the mechanism used prior to this improvement in 1905. This improved work-supporting mechanism was more convenient for the operator and more positive in use and was also more accurate in its adjustments and permitted a wider range of adjustments of the shoe relative to the leveling roll.

In 1901 the machine was reorganized by incorporating in it the improvements shown in the drawings and described in the claims of patent No. 692,401, February 4, 1902, Winkley, and 668,635, February 26, 1901, Gifford. The 1899 machine was not organized to level properly the soles of shoes provided with Baltimore edges, because it was so organized that the leveling roll tipped at the same inclination on both sides of the forepart. This was not satisfactory in the leveling of Baltimore edges, because manufacturers did not desire to apply pressure at the same inclination to the outer extension edge as they did to the edge on the inner side of the shoe. Many manufacturers refused to use the automatic leveling machine until it was provided with the inventions of these patents No. 692,401 and 668,635.

The nature of the improvements which adapted the reorganized machine of 1901 for leveling shoes with extension edge soles is well indicated by typical claims of the patents. Claim 1 of patent No. 668,635, February 26, 1901, Gifford, is as follows: —

"1. A sole leveling machine, having, in combination, a leveling roll, a shoe supporting jack, connected mechanism for relatively actuating the roll and jack to level the sole of a shoe placed upon the jack, and two automatically operating adjusting devices connected with said actuating mechanism whereby the same is operated to shape the shank and the opposite edges of the forepart of a sole independently of each other, substantially as described."

Claim 1 of patent No. 692,401, February 4, 1902, Winkley, is as follows: —

"1. A sole leveling machine, having, in combination, a leveling roll, a shoe supporting jack, mechanism for relatively actuating the roll and jack to level the sole of a shoe placed upon the jack, an adjusting device connected with said mechanism, two independent mechanisms for automatically actuating said device and means for connecting said device to either of said mechanisms, substantially as described."

While the automatic leveling machine as reorganized in 1901 would level the great majority of shoes with entire satisfaction to manufacturers, it still lacked the flexibility of adjustment which was required to adapt it for all kinds of work and to meet all conditions which had to be dealt with in the leveling of welt shoes. For example, it lacked capacity for adjustment to vary the operation of the leveling roll at any point where the manufacturer might wish to vary its operation in accordance with the style of the shoe or the particular shape which he desired for the sole. It also lacked any provision for adjustment to enable it to level shoes which had shanks longer or shorter in proportion to the forepart than the shanks of the average shoe. Consistently with the development of this machine which has been steadily toward making it a universal machine which would be adapted to level satisfactorily all welt shoes of whatever kind or style, experimental work was carried on with the object of providing the machine with universal adjustments and adapting it for every possible kind of work which might come to it, and as a result of the experimental work there was produced, in December, 1910, a machine which was known as "Leveling Machine, Goodyear Automatic Sole, Model B." This new machine was characterized by two important improvements; the first consisted in an organization which permitted adjustment to vary independently the plane which was imparted to the sole at different regions. This improvement is set forth in all of the eight claims of patent No. 889,287, June 2, 1908, Winkley, a typical claim of which is the first: —

"1. A sole leveling machine, having, in combination, a sole leveling roll, a shoe supporting jack, means to change the relative lateral inclination of the roll and jack, and means for independently adjusting the relative lateral inclination of the roll and jack for operation upon any one of a plurality of different portions of the shoe."

The second important improvement which was characteristic of this model B machine consisted in means by which the machine could be adapted for operation upon shoes having shanks longer or shorter in proportion to the forepart than the shanks of average

shoes. This improvement is set forth in all of the twenty-one claims of patent No. 1,011,301, December 12, 1911, Winkley. Typical claims are the first and ninth, which are as follows: —

"1. A sole leveling machine, having, in combination, a shoe supporting jack, a sole leveling roll, connected mechanism acting automatically to change the relative longitudinal position and lateral inclination of the roll and jack, and means for varying the operation of said mechanism to compensate for variations in the relative length of the forepart and shank of shoes of different styles."

"9. A sole leveling machine, having, in combination, a shoe supporting jack, a sole leveling roll, connected mechanism acting automatically to change the relative longitudinal position and lateral inclination of the roll and jack including two compensating mechanisms acting respectively to control the operation of said mechanism while the inside margin and the outside margin of the sole are being operated upon, and means for adjusting said compensating mechanisms to vary the points on the inside and outside margins of the sole at which a change is made in the relative lateral inclination of the roll and jack for operation on the forepart."

Improvements embodied in this new model B machine are also set forth in all of the three claims of patent No. 1,054,263, February 25, 1913, Winkley (application filed October 3, 1910).

This model B machine is now undergoing further reorganization to incorporate additional improvements which contribute to the convenience of the operator, and particularly in the way of facilitating the effecting of all of the adjustments easily and quickly. It is also anticipated that further improvements of a nature to improve the quality of the work will be embodied in the machine.

This machine, the leveling machine, Goodyear automatic sole, is put out by the United Shoe Machinery Company through its Goodyear department.

Mr. WEBSTER. Please note petitioner's objection to all reference in the foregoing answer to patents dated after the date of the filing of the petition herein, as incompetent, inadmissible and irrelevant, and as having no reference to the questions at issue in this cause.

Int. 48. Have you collected in a volume the several Letters Patent to which you have referred to in your prior testimony as relating to automatic sole-leveling machines of the vibrating roll type?

Ans. Yes, sir, and I produce the volume.

[*Volume of patents so produced is introduced in evidence, and marked "Defendants' Exhibit 120".*]

Mr. WEBSTER. Please note objection of petitioner to introduction of patents issued after date of the filing of the petition herein.

Int. 49. Will you please give the number, date and the name of patentee of the several patents included in the volume which has just been offered in evidence as Defendants' Exhibit 120?

Ans. No. 540,222, May 28, 1895, Winkley and Phillips.

No. 540,223, May 28, 1895, Winkley and Phillips.

No. 541,988, July 2, 1895, Winkley.

No. 546,211, September 10, 1895, Winkley and Phillips.

No. 555,548, March 3, 1896, Winkley.

No. 580,746, April 13, 1897, Winkley.

No. 610,314, September 6, 1898, Winkley.

No. 668,635, February 26, 1901, Gifford.

No. 677,550, July 2, 1901, Meyer.

No. 692,401, February 4, 1902, Winkley.

No. 889,287, June 2, 1908, Winkley.

No. 1,011,301, December 12, 1911, Winkley.

No. 1,054,263, February 25, 1913, Winkley (application filed October 3, 1910).

STITCH-SEPARATING MACHINES.

Int. 50. What is the function of a stitch separator in the manufacture of shoes?

Ans. A stitch-separating machine is used to form indentations in the upper face of the welt of a welt shoe in the intervals between contiguous stitches. I produce a welt shoe which has been operated upon by the stitch-separating machine.

[*Shoe so produced is offered in evidence, and marked "Defendants' Exhibit No. 121".*]

Int. 51. What was the first patent directed to a stitch separator, and if the stitches were separated prior to that patent, how was it done?

Ans. The first patent disclosing a machine organized for separating the stitches of a finished out-seam was No. 521,978, June 26,

1894, Hadaway, which was reissued as reissue No. 11,538, May 12, 1896. The first commercial machine for performing this operation is shown in patent No. 543,012, July 23, 1895, Hadaway. Prior to the production of this machine stitches had been separated by a hand operation, the workman using a hand tool which was a form of chisel.

Int. 52. In his answers to questions 60 and 61 Mr. Chapman compared the cut shown on page 89 of Plaintiff's Exhibit 220 (catalogue of the Goodyear Company, issued January 1, 1897) with a stitch separator, No. 124, which he saw at Whitman. What does the cut on page 89 represent, and when was the machine of that cut first put into use?

SEPARATING MACHINE: HADAWAY STITCH.

Ans. The machine illustrated in the cut on page 89 of Plaintiff's Exhibit 220, Goodyear Shoe Machinery Company's catalogue of 1897, was the first commercial machine for separating stitches. That machine was first put out in September, 1895, and was the commercial stitch-separating machine of the United Shoe Machinery Company early in 1899.

Int. 53. If the subjects-matter of any Letters Patent of the United Company were embodied in that machine as the same was put out by the United Company in 1899, what were those patents, and state briefly their relation to said machine?

Ans. The machine as put out by the United Company in 1899 embodied mechanism set forth in the claims of —

Reissue patent No. 11,538, May 12, 1896, Hadaway;

No. 537,823, April 23, 1895, Hadaway;

No. 543,012, July 23, 1895, Hadaway.

Typical claims of reissue No. 11,538 are 2 and 14, which are as follows: —

"2. In a machine for separating the stitches of boot or shoe soles, the combination of a work support; an automatically adjustable separator for locating the intervals between the stitches whether of uniform or varying lengths; and means having provision for forcing said tool between the stitches when the point of said tool has located itself in the space between two stitches."

"14. In a machine for separating stitches, the combination with a work support, of locating an indenting means and connected mechanisms operating automatically to actuate said means to locate and indent the intervals between the stitches after the sewing has been completed."

The problem which had to be solved in the production of a commercial machine for separating stitches, that is, for performing an operation previously performed by hand, and, on account of the expense of the operation, performed only on the highest grades of shoes and the most expensive shoes, was indicated by the claims which I have just quoted. The stitches of the out-seam vary in length and a machine for performing this operation must be able to automatically find the interval between each pair of successive stitches, whatever their length, and force the indenting tool to properly enter the interval between each pair of contiguous stitches.

The machine shown in the drawings of this reissue patent No. 11,538 was not a commercial machine. In the experimental machine shown in those drawings the stitch-finding movement of the separating tool was in the same direction as its feeding movement, in which the tool, after it had formed the indentation, was moved to feed the work along a distance approximately equal to the length of a stitch. This organization required that the stitch-separating tool at the beginning of its finding movement come down upon the top of a stitch and there was constant liability that the tool would deface or mutilate the thread in the stitches. An attempt to overcome this difficulty is represented by patent No. 537,823, April 23, 1895, Hadaway. In the organization of the machine shown in the drawings of this patent the stitch-finding movement of the tool was in the opposite direction to the direction of its work-feeding movement. A typical claim of this patent, which represents an important step in the development of a commercial machine, is the first:—

"1. In a machine for separating the stitches on boot and shoe soles the combination of a work support; an automatically adjustable separator for locating the intervals between the stitches whether of uniform or varying lengths; and means for moving said tool in

one direction to locate the interval between the stitches and means for moving said tool in the opposite direction to feed the work."

The first commercial machine adapted for satisfactory use in shoe factories under commercial conditions was constructed as shown in the drawing set forth in the claims of patent No. 543,012, July 23, 1895. In the organization of the machine shown in this patent the liability of injuring the stitch by bringing the separating tool down upon the top of a stitch at the beginning of its stitch-finding movement and then rubbing the tool across the top of that stitch was overcome by arranging the tool so that at the end of its work-feed movement it went back the length of a standard stitch and then was depressed for its stitch-finding movement. If the stitch was of average or standard length, which would usually be the case, the tool would immediately drop into the stitch interval. The tool was, however, arranged to have a stitch-finding movement in two directions after it descended, so that if the stitch happened not to be of standard length the tool would quickly locate it, but without the danger of mutilating the tops of stitches which was present in the construction shown in the earlier patents.

Int. 54. State whether or not since 1899 there have been any improvements or modifications introduced in, or in connection with, the stitch separator put out by the United Company. If so, what they were, the reason for them, and their importance in the art; if the same are shown and described in any Letters Patent of the United Company, name the patents.

Ans. The 1899 stitch-separating machine was not provided with means for adjusting the machine to enable it to operate properly upon shoes having the tread face of the sole and the upper face of the welt in planes at varying inclinations. The machine was first provided with means for adjusting it to provide for such variations between the planes of the welt and the tread face of the sole by the improvement shown in patent No. 690,422, January 7, 1902, Hadaway. A typical claim defining this improvement is 4:—

"4. A stitch separating machine, having, in combination, an indenting tool and actuating means therefor, a slide, a work support mounted thereon arranged to engage the bottom of a shoe

sole, and means for adjusting the work support on said slide to vary the angle of inclination of the sole engaging surface, substantially as described."

This improvement was adopted in 1901. Another defect in the machine of 1899 was that on the heavier classes of work the machine could not be depended upon to force the tool the desired distance into the stock between the two stitches. In January, 1902, improved means for operating the stitch-separating tool was adopted which overcame this objection. The first claim of patent 719,584, February 3, 1903, Hadaway, is : —

"1. A stitch separating machine, having, in combination, a tool supporting lever, a stud projecting from one side of the lever, a tool stock pivotally mounted thereon, an indenting tool on the tool stock and a pressure lever for actuating the tool supporting lever provided with an abutment arranged to support the stud against the backward thrust of the tool, substantially as described."

The improvement of this patent combined with mechanism which is described in patent No. 690,422, to which I have referred, effectively overcame the failure of the machine to operate properly on heavy work. The improvement of patent No. 690,422, which was a step in the development of such means, is defined in claim 9 of that patent : —

"9. A stitch separating machine, having, in combination, an indenting tool, a lever upon one side of which the tool is mounted, a projection on the other side of the lever, a rigid support arranged to be engaged by said projection when the lever is sprung by a resistance offered to the tool, and means for actuating the lever, substantially as described."

The machine, as put out in 1899, was further defective in that it made an indentation which was of the same depth from the outer edge of the welt to the end of the indentation adjacent to the upper. Making the indentation adjacent to the upper of the same depth as in the outer portion of the edge was objectionable, because it involved danger of injuring the inseam and tearing the welt away from the upper. This objection was overcome by an improvement adopted in 1902 and shown in patent No. 906,705, December 15, 1908, Hadaway (application filed June 6, 1904). The improve-

ment is defined in the first two claims of that patent, of which a typical claim is the first: —

"1. A stitch indenting tool, having a grooved working face, the surfaces of which are substantially plane and continuous throughout the working face of the tool and which are curved upwardly at their outer ends to prevent this portion of the working face from marring the work when the remaining portion is forced below the surface of the work, substantially as described."

The improvement of this patent 906,705, like the improvement of patents Nos. 690,422 and 719,584, has been embodied in the commercial machine ever since its adoption.

In 1904, in the endeavor to extend the field of usefulness of the stitch-separating machine, an improvement was made in it which would adapt it to make imitation stitches in addition to its function as a stitch-separating machine. This improvement is shown in patent No. 933,174, September 7, 1909, Hadaway (application filed April 25, 1904). A typical claim of this patent is the first: —

"1. A machine for making imitation stitches, having in combination, a tool carrier, an automatically adjustable indenting tool mounted thereon, means including the tool carrier for actuating the tool to indent and feed the work, and means independent of the work acting automatically to move the tool on its carrier and thereby adjust the tool to regulate the extent of the feeding movements imparted to the tool, substantially as described."

The structure set forth in the claim which I have just quoted is regularly embodied in the commercial stitch-separating machine. This machine, the official name of which is "Separating Machine; Hadaway Stitch", is put out by the United Shoe Machinery Company through its Goodyear department. The company had put out 1361 machines before March 1, 1913.

Int. 55. Referring again to the stitch separator, No. 124, which Mr. Chapman examined at the Whitman factory, have you examined that machine?

Ans. I have.

Int. 56. State whether that machine is in the same condition as when it was leased by the Goodyear Company, and whether there are embodied in it the subjects-matter of any Letters Patent of the United Company issued after 1899.

Ans. Stitch-separating machine No. 124, which was referred to by Mr. Chapman and which I examined at the Whitman factory of the Commonwealth Shoe & Leather Company, is not now in the condition in which it was leased to the Commonwealth Shoe & Leather Company by the Goodyear Shoe Machinery Company. The machine has been reorganized and as now organized is constructed substantially as shown in part in the drawings of patent 719,584 and in part in the drawings of patent 933,174, both of which patents I have referred to above. The reorganized machine as it now stands in the Whitman factory embodies important inventions of the following patents: —

No. 690,422, January 7, 1902, Hadaway.

No. 719,584, February 3, 1903, Hadaway.

No. 933,174, September 7, 1909, Hadaway.

The importance of the mechanisms set forth in the claims of these patents has been indicated in the foregoing detailed discussion of those patents.

Int. 57. Have you collected in a volume the Letters Patent referred to by you in your prior testimony as relating to stitch separators; if so, will you please produce it?

Ans. Yes; and I produce the volume.

[*Volume of patents so produced is introduced in evidence, and is marked "Defendants' Exhibit 122".*]

Int. 58. Will you please state the number, date and name of patentee of each of the patents included in the volume Defendants' Exhibit 122?

Ans. No. 521,978, June 26, 1894, Hadaway.

Reissue No. 11,538, May 12, 1896, Hadaway.

No. 537,823, April 23, 1895, Hadaway.

No. 543,012, July 23, 1895, Hadaway.

No. 690,422, January 7, 1902, Hadaway.

No. 719,584, February 30, 1903, Hadaway.

No. 906,705, December 15, 1908, Hadaway.

No. 933,174, September 7, 1909, Hadaway.

PEGGING MACHINES.

Int. 59. What is the function of a pegging machine in the manufacture of boots and shoes?

Ans. Prior to February, 1899, and most of the time since that date pegging machines were used exclusively for attaching the soles of boots or shoes by means of wooden pegs. In recent years some five or six machines have been put out by the United Shoe Machinery Company for use in performing an operation known as "nailing heel seats", that is, securing the heel ends of the soles to the insole and upper. Within the past year a few machines have also been used for driving wooden slugs into the toplifts of heels. These heel slugs are almost universally of metal, and probably the slugging of the toplifts of heels with wooden pegs is a temporary fad.

Int. 60. What was the first pegging machine commercially used in the manufacture of shoes and boots?

Ans. One of the earliest patents on pegging machines is No. 21,593, September 1, 1858, Sturtevant. I am not advised as to the extent to which the machine of this patent No. 21,593 was put into use, but a commercial machine which was known as the "New Era Pegging Machine", and was very extensively used, is shown in patents No. 34,335, February 4, 1862, Sargent, and No. 44,048, August 30, 1864, Sargent. A typical claim of patent No. 34,355 is the first: —

"1. As a new machine, the combination of the mechanism for operating the awl, peg driver, and for feeding the work, with a mechanism for cutting and feeding the peg wood, all being arranged compactly in the frame A or its equivalent and operated by the cams and levers, arranged substantially as and for the purposes described."

Int. 61. Mr. Chapman in his answer to question 70 has compared the Davey pegging machine which is at the Whitman factory of the Commonwealth Shoe & Leather Company with a cut on page 76 of Plaintiff's Exhibit 190 (being United Company's catalogue of 1902); have you examined the pegging machine referred to by Mr. Chapman; and, if so, what have you to say as to the accuracy

of Mr. Chapman's comparison? In answering this question please state whether or not the pegging machine at the Whitman factory is in the same condition that it was in when it was purchased from John F. Davey in 1895.

Ans. I am forced to the conclusion that Mr. Chapman's comparison of the pegging machine in the Whitman factory with the cut on page 76 of Plaintiff's Exhibit 190, being the United Company's catalogue of 1902, was very hurried, and it is evident that Mr. Chapman had not had an opportunity to examine a modern pegging machine. As to his statement that "in point of general mode of operation and functional results the two machines are substantially the same", practically the only similarity between the two machines is that they both can be operated to drive a wooden peg. The pegging machine in the Whitman factory of the Commonwealth Shoe & Leather Company is an obsolete machine. No machine of that type has ever been supplied to a shoe manufacturer by the United Shoe Machinery Company, and that pegging machine in the Whitman factory is the only machine of that type which is in use in any shoe factory in the world, so far as I can ascertain. The machine as now used in the Whitman factory is not in the condition in which it was sold to the Commonwealth Shoe & Leather Company in 1895. When it was sold it was equipped with inventions shown and defined in the claims of patent 555,434, February 25, 1896, Davey. That patent was the first patent on what has since been known as a "horn pegging machine" and represented the intermediate step between the earlier type of pegging machine and the modern pegging machine illustrated in the cut on page 76 of Plaintiff's Exhibit 190, United Company's catalogue of 1902.

Prior to the machine illustrated in Davey patent 555,434 it had been the universal practice in pegging shoes to insert the pegs while the last was still in the shoe. The pegs were all of uniform length and all longer than the average thickness of the material to be united, so that the ends of the pegs were driven into the wooden last. Then the last had to be pulled out of the shoe and the ends of the pegs had to be cut or broken off by a tool such as I now produce, which is known as a "peg rasp".

[*Peg rasp so produced is introduced in evidence, and marked "Defendants' Exhibit No. 123".*]

[*Answer to Int. 61 continued:*]

In the use of the pegging machine which is illustrated in patent No. 555,434, February 25, 1896, Davey, it was possible to peg shoes on the horn. This machine represented a great advance in the art over the prior machines, the operation of which I have just described, since it saved considerable of the operator's time and also a great expense in lasts, which were very soon worn out by the constant driving into them of the ends of the pegs. It was still necessary, however, in the use of the pegging machine of patent No. 555,434 to break off the ends of the pegs inside the shoe by means of a tool such as is illustrated in Defendants' Exhibit 123. I produce a horn tip such as was used on the machine of patent No. 555,434 and such as was on the pegging machine in the Whitman factory of the Commonwealth Shoe & Leather Company when that machine was purchased from John F. Davey in 1895.

[*Horn tip of Davey pegging machine of 1895 so produced is introduced in evidence, and marked "Defendants' Exhibit No. 124".*]

PEGGING MACHINE: DAVEY.

[*Answer to Int. 61 continued:*]

This horn tip was the improvement in pegging machines which first made it possible to peg shoes on a horn instead of on a wooden last. The machine of this patent No. 555,434, February 25, 1896, represented, however, only a brief transitory period in the development of pegging machines. Before February, 1899, that machine had been superseded by an entirely new and different type of machine and the standard commercial pegging machine which was being supplied to shoe manufacturers in 1899 was organized to cut off the end of each peg inside the shoe at the instant the driving of the peg had been completed. That machine incorporated also some inventions made after February, 1899, and is the machine which is shown on page 76 of the Plaintiff's Exhibit 190, United Company's catalogue of 1902. In fact, the general operation of that machine which constitutes its fundamental distinction over all

prior machines is indicated in the descriptive matter on page 77 of Plaintiff's Exhibit 190, United Company's catalogue of 1902, which page 77 is directly opposite page 76, on which is shown the cut with which Mr. Chapman compared the machine at the Whitman factory. I quote from this descriptive matter the following statement:—

"There are cutting devices mounted in the tip of the horn and operated automatically by mechanism which cleanly cut off the projecting ends of the peg on the inside of the shoe as fast as the pegs are driven in."

I produce a horn tip such as was used in the commercial Davey pegging machine in 1902 at the date of the catalogue Plaintiff's Exhibit 190.

[*Horn tip of present commercial Davey pegging machine is introduced in evidence, and marked "Defendants' Exhibit 125".*]

[*Answer to Int. 61 continued:*]

In this exhibit the cutters in the tip of the horn which are operated immediately after each peg is driven to sever the end of the peg inside the shoe can be operated by moving a rod on the opposite end of the exhibit. In the commercial machine this rod is operated automatically by connections which extend down through the horn across the base of the machine and up through the machine frame to the driving shaft.

The pegging machine at the Whitman factory which was discussed by Mr. Chapman in his answer to question 70 is not now in the condition in which it was when it was purchased from John F. Davey in 1895. The machine is now provided with a "jack" or work support which is constructed substantially as illustrated and defined in the claims of patent No. 919,424, April 27, 1909, Cuff, which patent is owned by the United Shoe Machinery Company. The jack shown and claimed in that patent is known as "No. 8 Jack", and is supplied in large numbers by the United Shoe Machinery Company for use on loose-nailing machines and machines for slugging the toplifts of heels. As no photograph of the pegging machine at the Whitman factory has been introduced in evidence, and as I have had no opportunity to photograph that machine,

I have had a photograph made of Davey pegging machine No. 79, which was one of the machines constructed as shown in patent No. 555,434, February 25, 1896. According to Mr. Davey's records, the machine at the Whitman factory is No. 76, although in my examination of that machine I was not able to find any number on the machine. I have, however, compared the photograph which I now produce with the machine at Whitman, and I find that it shows accurately the machine as it was sold to the Commonwealth Shoe & Leather Company by Mr. Davey in 1895. The horn which was then on the machine and which is shown in this photograph is not now on the machine, but is lying on a shelf near it.

[*Photograph of old Davey pegging machine equipped with horn, patent No. 555,434, February 25, 1896, is introduced in evidence, and marked "Defendants' Exhibit 126".*]

[*Answer to Int. 61 continued:*]

After having made the photograph Exhibit 126, I had the horn shown in that exhibit removed from the machine and had a No. 8 jack, such as is on the machine at Whitman, substituted for the original horn. I now produce a photograph showing the Davey pegging machine of 1895 equipped with a No. 8 jack. I have compared this photograph with the pegging machine in the Whitman factory and find that it shows accurately that pegging machine in its present condition, with the unimportant exception that the shape of the upright rod which is supported in bearings extending from the machine frame, and which carries at its upper end the jack, is slightly different in the pegging machine at the Whitman factory.

[*Photograph of old Davey pegging machine equipped with No. 8 jack is introduced in evidence, and marked "Defendants' Exhibit 127".*]

Mr. WEBSTER. Please note the petitioner's objection to introduction of this exhibit as having no bearing on the questions at issue in this cause.

[*Answer to Int. 61 continued:*]

I also produce a photograph of the present commercial Davey pegging machine, the machine which is illustrated on page 76 of

Plaintiff's Exhibit 190, being the United Shoe Machinery Company catalogue of 1902, with which illustration Mr. Chapman compared the pegging machine at the Whitman factory. Comparison of this photograph with the photograph which I have produced showing substantially the present condition of the pegging machine at the Whitman factory will be of interest in considering the accuracy of Mr. Chapman's comparison.

[*Photograph of commercial Davey pegging machine shown in Plaintiff's Exhibit 190, page 76, is introduced in evidence, and marked "Defendants' Exhibit 128".*]

Mr. WEBSTER. Please note at this point the objection of counsel for petitioner to the unwarranted criticism by this witness of Mr. Chapman. Counsel for petitioner also objects to the statements heretofore made by this witness relating to what he learned from Mr. Davey's records, and any information which he obtained with reference to the machine at the Whitman factory from others, as hearsay, and therefore inadmissible and incompetent.

[*Adjourned to 10 A. M., Thursday, October 9, 1913.*]

BOSTON, MASS., October 9, 1913.

Int. 62. Please state whether in a commercial Davey pegging machine as put out by the United Company in February, 1899, there was embodied the subject-matter of any patent, and if the machine has been improved since February, 1899, please state what the improvements were, what was the reason for making them, and whether or not these improvements are described in any patents owned by the United Company; if so, name the patents.

Ans. The Davey pegging machine as supplied to shoe manufacturers in 1899 and just prior to that time was organized substantially as is shown in patent No. 581,066, April 20, 1897, Davey and Ladd. Nearly all of the thirty-two claims of that patent set forth mechanisms which were embodied in the commercial machine at that time. Typical claims of the patent are 1 and 5, which are as follows: —

"1. The combination of a rotatable horn or work support provided with a work supporting surface, and with a pair of cutting

jaws both movable with relation to said surface, and actuating mechanism therefor, substantially as described."

"5. The combination of the horn or work support capable of complete rotation and having a tip provided with a perforation concentric with the axis of rotation of the horn, a cutting device in said horn and means to move it to cut the peg tip, a pegging mechanism comprising an awl and driver and means for moving said awl and driver laterally to feed the material, and actuating mechanism for driving the awl longitudinally into the material at or near the beginning of said lateral feed movement, and for moving the awl wholly through the material at the completion of said lateral movement, substantially as described."

The organization of the two claims which I have just quoted solved for the first time in the history of the industry the problems which had to be dealt with in organizing a pegging machine which should cut off the ends of the pegs projecting through the stock inside of the shoe.

Among the most important of these problems was the provision of a peg-cutting organization which could be incorporated in a horn tip which was small enough to permit the driving of pegs at any point where they needed to be driven, to secure the sole properly, and obviously the horn tip must be small in order to permit proper operation at the toe; the organization of the horn tip with its peg-cutting mechanism in such manner that the stock would be supported against the thrust of the awl and the stroke of the driver forcing the peg through the stock on both sides of the stock closely adjacent to the point where the awl hole was made and the peg was driven; and, further, the machine must be so organized that the awl will form a hole which is at least as long as the peg to be inserted in the hole, because a wooden peg differs from a metal fastening in that it must have formed for its reception a hole which shall be at least as long as the peg; otherwise the wooden peg will break or splinter and cannot properly be driven.

As to the problem of forming a hole for the peg, it follows from what I have said that in the class of work for which pegging machines have generally been used and for which they are primarily intended, that is, attaching out-soles, the hole for the peg must be made entirely through the stock, comprising the out-sole and insole,

and in making this hole the machine must be so organized that the point of the awl may pass entirely through the insole and emerge beyond its inner face inside of the shoe.

The mechanism of the 1899 machine shown, as I have stated, in patent No. 581,065, which was employed in that machine for cutting off the ends of the pegs inside of the shoe as the pegs were driven, has, since the formation of the United Shoe Machinery Company, been reorganized so that its commercial form is now as shown in patent No. 1,028,240, June 4, 1912, McFeely (original application filed March 24, 1900).

The reorganization of the cutter-operating mechanism which is illustrated in the drawings of this patent No. 1,028,240, and which constitutes the subjects-matter of all of the twenty-eight claims of the patent, was necessitated by the fact that in the organization of the 1899 machine, when the horn was depressed to accommodate thicker stock, the cutters were necessarily moved toward each other, and when the stock was unusually thick the cutters were moved so near each other that they were sometimes in the way of the awl as it emerged from the stock inside of the shoe. This frequently resulted in breaking of the cutters and sometimes, also, the point of the awl was broken. These defects were entirely removed by the improvements of patent No. 1,028,240 by which the mechanism was so organized that vertical movement of the horn to whatever extent produced no effect whatever upon the cutters. A typical claim of patent No. 1,028,240 setting forth this improvement is the fifth, which is as follows: —

"5. In a pegging machine, the combination with a vertically movable horn; of a cutting device operating in said horn; means for operating the cutting device located independently of the horn; and connections from said means to said cutting device so constructed and arranged that the cutting device is actuated only by said means and is unaffected by vertical movements of the horn."

Mr. WEBSTER. Please note at this point petitioner's objection to all reference to patents issued since the date of the filing of the petition, for reasons heretofore given.

[*Answer to Int. 62 continued:*]

Further improvements in the present commercial machine relat-

ing to the so-called "button" which forms the bearing surface for the stock at the extreme tip of the horn, and which encloses and holds in position the cutter, are also disclosed and described in the claims of patent No. 1,028,240 and may be noted in Defendants' Exhibit No. 125. The cutters in the horn tip have frequently to be renewed and in the construction of the machine as put out in February, 1899, it was inconvenient to get out the old cutters and to replace them, and difficulty was occasioned by the means employed for securing the button to the horn. The present commercial construction is defined in a number of claims of patent No. 1,028,240, of which a typical claim is 28: —

"28. The combination with the horn provided with inner concave cylindrical bearing surfaces at opposite sides; of a pair of cutter jaws provided with convex cylindrical bearing surfaces at their outer sides and concave cylindrical bearing surfaces at their inner sides; and a cylindrical bearing member extending transversely through the horn to afford a support for the inner bearing surfaces of the cutter jaws; substantially as described."

This machine is now, and has been since February, 1899, put out by the United Company through its metallic department.

Int. 63. Have you collected in a volume the patents referred to by you in your testimony as relating to the Davey pegging machine?

Ans. Yes, sir; and I produce the volume. [*Witness produces volume.*]

Mr. PHILLIPS. We offer this.

[*Volume of patents relating to pegging machines introduced in evidence, and marked "Defendants' Exhibit 129".*]

Mr. WEBSTER. Petitioner objects to the introduction of patents dated since the date of the filing of the petition herein, the objection being for the reasons heretofore given.

Int. 64. Will you please give the number, the date and names of the patentees of the several patents included in the volume which has just been offered in evidence as Defendants' Exhibit 129?

Ans. No. 21,593, September 21, 1858, Sturtevant.

No. 34,335, February 4, 1862, Sargent.

No. 44,048, August 30, 1864, Sargent.

No. 555,434, February 25, 1896, Davey.

No. 581,066, April 20, 1897, Davey and Ladd.
No. 919,424, April 27, 1909, Cuff.
No. 1,028,240, June 4, 1912, McFeely.

SKIVING MACHINE: AMAZEEN.

Int. 65. What is the function of the Amazeen skiving machine such as referred to by Mr. Chapman in his answer to interrogatory 71?

Ans. The Amazeen skiving machine is used to form a wide beveled thin edge on parts of uppers which are subsequently to have that edge folded in order to impart to the edge the finished appearance which is desired in prominent parts of the upper of the shoe. The purpose of the operation is to permit the folding of the stock, that is, the turning over of its extreme edge upon the body of the stock without unduly increasing the thickness of the finished edge, which, without such skiving, would obviously be of double the thickness of the stock. A sample of the work done on the Amazeen skiving machine is shown in Defendants' Exhibit 28.

Int. 66. What was the first patent showing the skiving machine of the Amazeen type?

Ans. The first patent of which I am aware disclosing the Amazeen type of skiving machine is patent No. 200,682, February 26, 1878, Amazeen. I am not advised as to the extent of use of the machine constructed under that patent, but patent No. 220,906, October 28, 1879, Amazeen, shows the first commercial Amazeen skiving machine which was put into commercial use. In later years the machine which was constructed as shown in the drawings of that patent was known as "Amazeen Skiving Machine, Model No. 1".

A typical claim of patent No. 200,682 is the third, as follows:—

"3. The combination of a feeding device and a revolving cutting device, both substantially as above described, the cutting edge, when making a cut, moving away from the feed and in a direction across the line of feed, as set forth."

Int. 67. Have you examined the Amazeen skiving machines at the Whitman factory of the Commonwealth Shoe & Leather Com-

pany? If so, please state whether the machines which you examined embodied the subject-matter of any patent. If so, please name the patent.

Ans. I have examined the Amazeen skiving machines at the factory of the Commonwealth Shoe & Leather Company, and find that three of these machines are of the type knownas "Amazeen Skiving Machine, Model 6", and are constructed substantially as shown on page 132 of Plaintiff's Exhibit 190, being United Shoe Machinery Company catalogue of 1902, with the exception that these three machines are provided with mechanism illustrated in the drawings of patent No. 452,996, May 26, 1891, Dunham. In addition to the mechanism shown in this Dunham patent the machines embodied the mechanisms which are illustrated and set forth in the claims of the following patents:—

No. 609,868, August 30, 1898, Bayley.

No. 632,984, September 12, 1899, Bayley.

No. 636,942, November 14, 1899, Bayley.

No. 645,381, March 13, 1900, Bayley.

In addition to these three model 6 Amazeen skiving machines, I found in the Whitman factory a number of old machines of various types, some of which were of the type now designated as the model 3 Amazeen skiving machine and others of which I was not able to identify as having been manufactured either by the United Shoe Machinery Company or by its predecessor, the Amazeen Machine Company. All of these old machines, however, were organized as is illustrated in the drawings and set forth in the claims of patent No. 452,996, May 26, 1891, Dunham, which patent has been owned by the United Shoe Machinery Company and by its predecessor, the Amazeen Machine Company, since June 10, 1898.

Int. 68. Please state what improvements, if any, have been made by the United Shoe Machinery Company or its predecessor, the Amazeen Machine Company, upon the old type of machine which, as you state, is known as model 3. In answering this question please state the reason for such improvements as have been made, and whether such improvements constitute the subject-matter of United States Letters Patent. If so, name them.

Ans. The first improvement upon the model 3 machine consisted in means for providing ready adjustment of the relative positions of the knife and feed roll. This is a delicate adjustment and has to be made frequently, owing to the fact that the knife has to be ground very often — several times a day. This grinding decreases rapidly the diameter of the circular knife and wears it down so fast that the knife has to be renewed after a period from two to six weeks, according to the skill of the operator in grinding. This improvement provided a satisfactory quick adjustment for the relative positions of the cutter and feed roll, and before this improvement was made that adjustment was an awkward performance. This improvement is set forth in patent No. 518,774, April 24, 1894, Bayley. A typical claim of this patent, directed to this improvement, is the first: —

"1. In a skiving machine, the combination with a cutter to skive the material, of a rotating work supporting or feeding wheel, its shaft, and a yoke or frame therefor, and adjusting devices to adjust said yoke or frame toward and from said cutter and in a plane parallel with the plane of said cutter, substantially as described."

This patent No. 518,774 also illustrates and sets forth in its claims another improvement which represented a substantial advance in the machine. It is essential for the formation of a satisfactory bevel in the skiving operation that the extreme forward acting portion of the circular knife be located as nearly as possible in the middle of the bevel, whatever be the width of the bevel being formed by the knife. If the cutter is not so located it will cause buckling of the stock, and when that happens the knife will cut into the body of the stock and spoil the upper blank which is being operated. The improvement which contributed means for effecting this adjustment in the Amazeen skiving machine is set forth in claims of patent No. 518,774, April 24, 1894, Bayley, and a typical claim is the sixth: —

"6. In a skiving machine, the following instrumentalities, viz.: — A work supporting and feeding wheel, a rotating skiving cutter, bearings for the same and a carrier for the said cutter and its bearings, said carrier being adjustable longitudinally with relation

to said work supporting and feeding wheel, substantially as described."

When the machine had been reorganized to incorporate the two improvements to which I have referred, and which are illustrated and set forth in the claims of patent No. 518,774, the reorganized machine rapidly displaced the model 3 machines, that is, the machines which were like some of the old machines now in the Whitman factory, to which I have referred.

The next step in the development of the Amazeen skiving machine was the provision of a convenient organization for effecting the knife-grinding operation which, as I have explained, has to be performed several times a day, as the knife must be kept extremely sharp at all times during its operation. This improvement provided a grinder which could be moved instantly into and out of operative grinding relation to the knife, and which also moved with the knife in every one of the numerous adjustments which have to be made in the position of the knife. This improvement is illustrated in the drawings and set forth in the claims of patent No. 609,868, August 30, 1898, Bayley. A typical claim of this patent is the first:—

"1. The combination with a rotary disc cutter and movable bearing bracket or support therefor, of a grinder and grinder shaft and bearing frame or bracket therefor supported on said cutter shaft bracket, and means for adjusting the position of the grinder bracket upon the cutter bracket, whereby the said grinder may be set in proper position with relation to the cutter and retained therein independently of changes of position of the cutter, substantially as and for the purpose described."

The next improvement in the Amazeen skiving machine provided the machine with a sleeve bearing for the knife shaft, so constructed that the sleeve can be readily removed from the machine and the cutter shaft taken out without dismantling the machine. The purpose of the improvement is set forth in the following typical claim of patent 632,984, September 12, 1899, Bayley:

"1. In a skiving machine, the combination with a rotary knife shaft, of a sleeve surrounding and supporting said shaft, a movable bracket, means for detachably holding said sleeve in said movable

bracket, whereby the sleeve may be quickly and easily withdrawn to permit the removal of the knife without disturbing the relationship of the sleeve to the shaft."

The specific construction of this sleeve is illustrated in the drawings and set forth in the claims of patent No. 645,381, March 13, 1900. All of the seven claims of this patent set forth constructions embodied in the machine, and claim 1 is typical:—

"1. As a new article of manufacture a sleeve bearing for rotary longitudinally adjustable shafts, the same comprising cylindrical end portions and an open side intermediate connecting portion of enlarged interior diameter, substantially as and for the purpose described."

Improved mechanism which was embodied in the machine, and enabled the making of fine angular adjustments of the knife to vary the inclination of the bevel made on the stock, is shown and set forth in all of the six claims of patent No. 636,942, November 14, 1899, Bayley. A typical claim of this patent is the first:—

"1. A skiving machine embodying in its construction a feed bed or roll, the frame, a block having a sliding connection relatively to the frame, a pivoted bracket on the block, a knife carried by the bracket and operating at an angle with respect to the surface of the feed roll, means carried by the stock for effecting a tilting adjustment of the bracket on the block, and means for fixing the bracket in adjustable position on the block."

All of the improvements set forth in the patents which I have been discussing were incorporated in the model 6 Amazeen skiving machine which is shown on page 132 of Plaintiff's Exhibit No. 190, the United Shoe Machinery Company catalogue of 1902. These improvements are also embodied in the three model 6 Amazeen skiving machines which I examined at the Whitman factory of the Commonwealth Shoe & Leather Company.

Since February, 1899, further improvements have been embodied in the Amazeen skiving machine. The first of these improvements is illustrated in the drawings, and forms the subject-matter of the eight claims of patent No. 823,586, June 19, 1906, Davenport. The model 6 machine was organized to run at high speed, but it was not practicable to run it at the highest speed of which it was

capable because it would not operate properly around curved or irregular portions of the edge of the shoe. The improvement of patent 823,586 made it practicable to run the machine at higher speed than had before been commercially practicable. A typical claim is the first: —

"1. In a machine of the class described, a device for operating upon the work, in combination with independent mechanism for feeding the work to said operating device, said work feeding mechanism comprising a feed disc, means to actuate said disc, and a connection between said actuating means and said disc arranged to permit the movement of the feeding disc to be retarded by resistance applied to said disc and to allow the actuating mechanism to move independently of said disc."

This improvement enabled the operator to retard the feeding of the stock when he was operating upon curved or irregularly shaped portions of the shoe.

It had long been desired to provide No. 6 model of the Amazeen skiving machine with a belt-driving mechanism for the knife. Equipping the machine with such a mechanism, while it would seem an apparently simple matter, involved difficuties owing to the frequent adjustments in directions at right angles to each other which had to be made in the cutting knife and its shaft, and adjustments which varied the vertical inclination of the cutter shaft. In the model 6 machine the cutter shaft was operated by gears and when the cutter shaft was moved bodily in various adjusting operations, which had frequently to be made, it was necessary to move the gear on the driving shaft which operated the cutter shaft, and, further, those gears were not a satisfactory mechanical arrangement because they were not well adapted for operating the cutter at the high speed at which it must be driven. There have been provided by the construction shown in Dunham patent No. 452,996, to which I have referred, a belt-driving attachment which had been applied to many of the old model 3 machines, and to some of the No. 6 machines, but a more satisfactory mechanism for securing the advantages desired is illustrated in drawings and set forth in the claims of patent No. 823,578, June 19, 1906, Bayley. This mechanism also discloses means for preventing the side pull which

the belt would tend to exert upon the cutter shaft, and which would interfere with the delicate adjustments required by the nature of the work of the machine. These two improvements are set forth in all of the seven claims of patent No. 823,578, of which typical claims are 1 and 8: —

"1. A skiving machine comprising a machine frame, a knife frame, adjustable with relation to the machine frame, a driving shaft carried by said machine frame and provided with a pulley, a movable knife carried by said knife frame, idle pulleys also carried by said knife frame, and a belt connecting said driving pulley and said movable knife to actuate the latter, said belt being adapted to be passed around said idle pulleys, whereby the tension of said belt is maintained substantially uniform in the varying relative adjustments of the said frames."

"8. In a skiving machine, a shaft mounted in suitable bearings, a rotary skiving knife mounted on said shaft, a pulley carried by said shaft near one end, and an adjustable half bearing for said shaft at the end adjacent to the pulley to support the shaft against lateral strain."

The mechanism set forth in claim 1 permitted any desired adjustment of the knife for the character of the work or to compensate for grinding, while in the old machines at the Whitman factory, which are provided with the belt-driving attachment of the Dunham patent 452,996, any substantial adjusting movement of the knife requires corresponding adjustment of the belt-driving mechanism.

When the improvements of patents No. 823,578 and No. 823,586 were incorporated in the machine, the machine was known as "Model 7", and that model is, and has been for several years, the standard commercial Amazeen skiving machine put out by the United Company.

The improvements which I have described, and which have been incorporated in turn in the model 6 and model 7 Amazeen skiving machines are important, because outside of what is known as the Brockton or South Shore district these skiving machines are almost universally run by girls and their operation of the machine is, of course, greatly facilitated by the advantages afforded by the numerous improvements which I have discussed. This machine is

put out by the United Shoe Machinery Company through its general department.

Int. 69. Have you collected in a volume the patents relating to the Amazeen skiving machine with regard to which you have been testifying?

Ans. I produce a volume which comprises copies of each of the patents which I have mentioned in my discussion of the Amazeen skiving machine.

[*Volume of patents so produced is offered in evidence, and marked "Defendants' Exhibit 130".*]

Int. 70. Please give the number, date and name of the patentee of the several patents contained in the volume which has just been offered in evidence as Defendants' Exhibit 130.

Ans. No. 200,682, February 26, 1878, Amazeen.
No. 220,906, October 28, 1879, Amazeen.
No. 452,996, May 26, 1891, Dunham.
No. 518,774, April 24, 1894, Bayley.
No. 609,868, August 30, 1898, Bayley.
No. 632,984, September 12, 1899, Bayley.
No. 636,942, November 14, 1899, Bayley.
No. 645,381, March 13, 1900, Bayley.
No. 823,578, June 19, 1906, Bayley.
No. 823,586, June 19, 1906, Davenport.

LASTING MACHINES.

Int. 71. State briefly the function of the lasting machine and the place of the Chase machine in the lasting machine art.

Ans. The operation of lasting consists of drawing or straining the upper over the last to which it is to be fitted and which determines the shape of the shoe, and securing the upper to the insole which is located on the bottom of the thread face of the last, and in welt shoes and in the better grades of McKay shoes has previously been tacked to the last. There are two general types of lasting machines. One is known as the "bed" type. In this type of machine the last and shoe are supported on two supports comprising a heel support and a toe rest, and the upper materials are

worked over into lasted position at the heel and the toe by means of devices known as "wipers". Also at the heel end the upper materials, including the stiff "counter", that is, the piece of sole leather or other material as leather board, which preserves the shape of the shoe at the heel while it is being worn, are wrapped around the heel end of the last and forced into close fitting engagement with the last by means known as a "heel band". In the bed type of lasting machine the securing of the upper to the insole in lasted position is not automatic, but is accomplished by driving tacks into the upper at the necessary points by the use of what is known as a "hand tacker", except around the toe of welt shoes, in which region it has been the practice since about 1898 to secure the upper materials in lasted position, welt work only wired, by means of a wire which is secured to a tack at one side of the toe and is carried around the toe and secured to another tack on the opposite side.

Of the bed type of lasting machine are the Chase lasting machine, the Ideal lasting machine, the McKay & Copeland lasting machine and the comparatively new No. 5 lasting machine, which is the present commercial machine supplied by the United Company.

In the other type of lasting machine, which is known as the "hand method" type, the upper is worked over the last and automatically secured in position by a step-by-step operation. This type of machine includes grippers for seizing and pulling the upper at successive points around the shoe, wipers co-operating with these grippers for forcing the upper down closely on the insole after it has been gripped and pulled by the grippers, and tacking mechanism for securing the upper in the lasted position in which it has been placed by the grippers and wipers. And these mechanisms are all operated automatically and the organization operates step by step successively upon different portions of the shoe. Of this type is the Consolidated hand method lasting machine.

As to the place of the Chase lasting machine in the lasting machine art, in 1899 the Chase lasting machine was the standard machine for lasting men's welt shoes, and substantially all men's

welt shoes which were being lasted by machine in 1899 were being lasted on the Chase lasting machine.

Int. 72. Was the Chase machine the first lasting machine in use? If not, what preceded it?

Ans. The first patent of which I am aware disclosing a lasting machine of the bed type is No. 25,673, October 4, 1859, Purington. That patent was reissued as No. 1,382, reissued January 6, 1863, Purington. The first claim of the reissued patent is as follows: —

"1. Compressing the upper around the last by means of clamps provided with projecting plates or flanges to turn the projecting edges of the upper over upon the insole or last in any manner, substantially as described."

The Purington machine was reorganized by the improvements of patent No. 28,120, May 1, 1860, Wells, and patent No. 41,967, March 15, 1864, Wells.

The first claim of patent No. 41,967 is as follows: —

"1. The combination of hinged or folding flanges with the end jaws, heel, and toe."

As further improved by patent No. 44,916, November 1, 1864, Fischer, and No. 90,651, June 1, 1869, Fischer, this machine was put out and commercially used to a considerable extent in the late '60's and '70's. The commercial machine was constructed as shown by the patent No. 44,916 with the wipers shown in No. 41,967 and the tipping toe head illustrated in No. 90,651.

LASTING MACHINE: CHASE.

Int. 73. Mr. Chapman has referred to certain Letters Patent, namely, —

No. 340,860, April 27, 1886;

No. 364,088, May 31, 1887;

No. 376,368, January 10, 1888;

No. 483,375, September 27, 1892;

all to Chase, as for inventions embodied in the Chase machine. Describe briefly the subjects-matter of these patents as the same were embodied in the Chase machine of 1899.

Ans. The first patent referred to by Mr. Chapman, No. 340,860, April 27, 1886, Chase, illustrated a step in the development of the "retarder", which is shown in the form in which it was commercially used in 1899 in patent No. 364,088, May 31, 1887, Chase, which was also referred to by Mr. Chapman. The commercial construction in 1899 is set forth in claims 1 and 2 of patent No. 364,088.

The construction of claims 3 and 4 of patent No. 364,088 was superseded in the commercial machine before 1899 by the improvement shown in patent No. 376,368, January 10, 1888, Chase. The adjusting screws shown in patent No. 364,088 as arranged to adapt the ends of the toe clasp to the shape of the toe were, in the later construction, used merely to limit the outer opening movement of the ends of the clasp as set forth in claim 4 of patent 376,368.

Claim 9 of that patent 364,088 describes specifically the wiper-operating mechanism and claims 10 and 11 are directed to the construction of the toe clasp of the machine.

The other patent referred to by Mr. Chapman, No. 483,375, September 27, 1892, illustrates and sets forth in its claim specifically the hand tacker which was being used in connection with the Chase lasting machine in 1899.

Int. 74. State whether or not in the Chase machine of 1899 there were embodied the subjects-matter of any patents of the United Company other than those named by Mr. Chapman. If so, which patents?

Ans. Patents not mentioned by Mr. Chapman which set forth mechanisms embodied in the commercial Chase lasting machine in 1899 are: —

No. 545,022, August 27, 1895, Chase.
No. 566,831, September 1, 1896, Willard.
No. 569,182, October 13, 1896, Dunphy.
No. 569,231, October 13, 1896, Ray.
No. 571,339, November 17, 1896, Chase.
No. 571,404, November 17, 1896, Shaw.
No. 571,429, November 17, 1896, Chase.

About 1895 the Chase lasting machine was reorganized and the

new machine which was first put out in 1895 and was being put out in 1899 was known as the "High Speed Chase Lasting Machine". That machine, of which the general organization is shown in patent No. 571,429, November 17, 1896, Chase, with the modifications shown in No. 571,404, November 17, 1896, Shaw, superseded in 1895 the old type of Chase lasting machine which was constructed substantially as shown in the patents which were discussed by Mr. Chapman.

The reorganization of the Chase lasting machine, which, as I have stated, took place in 1895, was required by the changing commercial conditions at about that time. At that date the use of stiff box toes was becoming more general and added to the problems of securing good lasting. I should explain that a box toe is a piece of sole leather or other stiff material which serves the purpose in the finished shoe and during its wear of maintaining the shape of the toe. Defendants' Exhibits 109 and 110 are provided with box toes. The problem of lasting the toes of shoes provided with such stiff box toes, the edges of which constitute a part of the upper material which must be shaped to the toe, forced down upon the bottom of the insole and secured in lasted position, was one of the problems confronting the manufacturers of the Chase lasting machine just prior to 1895 which led to the reorganization of the machine.

Another important reason why the reorganization of the Chase machine was necessary in 1895 was that about 1895 radical changes were made in the styles of lasts and the old type of Chase lasting machine was not organized properly to last shoes on the last which went into use in 1895. Prior to about 1895 the lasts which were in general use did not present difficult problems for the lasting machine. I produce a last such as was in use in 1893 and 1894.

[*Last used in 1893–1894 is introduced in evidence, and marked "Defendants' Exhibit 131".*]

[*Answer to Int. 74 continued:*]

The first step in the development away from lasts such as shown in Defendants' Exhibit 131 was toward narrower-toed lasts. A step in this development is illustrated in the last which I now pro-

duce, which was used in 1895 to 1898 and was known as the "Cottage toe".

[*"Cottage toe" last, 1895–1898, is introduced in evidence, and marked "Defendants' Exhibit 132".*]

[*Answer to Int. 74 continued:*]

After the introduction of the cottage toe last, the next step toward modern shapes of lasts was the "Tokio" last, which also was introduced and used during the period from 1895 to 1898.

[*"Tokio" last, used in 1895–1896, is introduced in evidence, and marked "Defendants' Exhibit 133".*]

[*Answer to Int. 74 continued:*]

This tendency toward narrower toes was carried to an extreme in this period between 1895 and 1898, as shown in the "razor toe" last, which I now produce and which was also used during that period from 1895 to 1898.

[*"Razor toe" last, 1895–1898, is introduced in evidence, and marked "Defendants' Exhibit 134".*]

[*Answer to Int. 74 continued:*]

The extreme limit of this development toward narrower toe lasts was an even narrower last which was known as the "needle toe" last.

With the introduction of narrow-toed lasts came new shapes for the heel ends of lasts which, before 1895, had been nearly symmetrical at the heel ends, that is, with the faces of the heel on the opposite sides substantially alike. On looking at the heel end of the "cottage toe" last, Defendants' Exhibit 132, it will be observed that the opposite sides of the heel are not symmetrical and in the "razor toe" last, which is Defendants' Exhibit 134, lack of symmetry will be observed on looking at the bottom of the heel end of the last. This last of symmetry in the heel ends of the lasts presented problems for the lasting operations with which the Chase lasting machine as it was constructed prior to 1895 could not deal. The problems were increased by the further modification in styles of lasts resulting in the introduction of lasts which have come to be known as "crooked lasts", which went into general use soon after 1895. I produce a last which was used in the period from 1899

to 1901, which was known as the "Bull Dog" last. This last shows the development toward the crooked lasts and also illustrates the lack of symmetry in the opposite sides of the heel which has characterized most of the lasts used during the past twelve or fifteen years.

[*"Bull Dog" last, 1899–1901, is introduced in evidence, and marked "Defendants' Exhibit 135".*]

[*Answer to Int. 74 continued:*]

An explanation of the improvements which adapted the reorganized Chase lasting machine which was introduced in 1895 and, as I have stated, was then known as the "High Speed Chase Lasting Machine", may advantageously be made in connection with a discussion of the patents which I have enumerated as showing the reorganized machine as it was adopted and first put out in 1895. Referring first to patents No. 571,404, November 17, 1896, Shaw, and No. 571,429, November 17, 1896, Chase, which together show the reorganized Chase lasting machine first put out in 1895, and as put out in 1899 the invention of the Shaw patent No. 571,404 enabled the operator to withdraw the toe-lasting mechanism from the toe during the lasting operation to observe whether he was properly lasting the toe portion of the shoe and to do this without disturbing at all the relation of the heel-lasting mechanism to the shoe. In the old Chase machine which was constructed prior to 1895, when the operator wished to examine the toe during the lasting operation he had to release the shoe entirely from the machine as the shoe was held in position in the machine by clamping engagement of the toe clasp at the toe and the heel band at the heel, and when the pressure of either of these was released the shoe was no longer held by the machine and when the operator resumed operations he had practically to begin his work all over again. As the lasting of the toe portion of the shoe is the most critical part of the operation and was rendered more so by the introduction of the narrow toes illustrated in the lasts which I have produced, it became even more necessary for the operator frequently to examine the toe during the lasting operation to see whether he was properly performing the work and in order that he might remove

any wrinkles which he found had been formed in the upper on account of the puckering which takes place around the curved portion of the toe during the lasting of the toe.

The organization of the new machine of 1895 by which the operator was enabled to release the toe-lasting mechanism to inspect the toe without affecting the heel-lasting mechanism is shown in patent 571,404, November 17, 1896, and is defined in the claim of that patent.

In my general description of the bed type of lasting machine I explained that the upper materials at the heel end of the shoe, including the counter or stiffening piece, are wrapped around the heel end of the shoe in a bed type of lasting machine by a mechanism comprising a "heel band". The problem of getting the upper materials into close engagement with the sides of the heel end of the last was provided for in the new machines by improvements set forth in a number of claims of patents 571,404, November 17, 1896, Chase, of which a typical claim is 13: —

"13. In a lasting machine, the combination of a pad with a pad support having independently movable longitudinal sections at each end, substantially as and for the purpose set forth."

Another improvement set forth in the claims of this patent 571,429, which contributed to the convenience of the operator was the organization of the toe-lasting mechanism by which the toe rest or support for the toe end of the shoe moved with toe-lasting mechanism when that mechanism was adjusted for longer or shorter shoes. A typical claim is 20: —

"20. In a lasting machine, the combination of movable toe rest and reciprocating toe lasting mechanism, the toe rest moving with the shoe in the direction of the length of the shoe when the toe rest is reciprocated, substantially as and for the purpose set forth."

The lasting of russet and patent leather shoes was provided for in the reorganized Chase machine of 1895 by arranging the toe rest so that it would move with the shoe during such relative movements of the shoe and lasting mechanisms as occurred during the operation. This improvement prevented discoloring russet shoes

and marring patent leather shoes, and is defined in claim 26, as follows: —

"26. In a lasting machine, the combination of an end lasting mechanism with a toe rest which moves with the shoe in the direction of the length thereof by contact therewith, substantially as and for the purpose set forth."

It may be of interest to note that the mechanism set forth in this claim 26, which I have just quoted, has always, since its adoption, been embodied in the Chase machine and has always been incorporated in the successor to the Chase machine, which is the No. 5 lasting machine, the present commercial bed machine of the United Company, and was also embodied in the lasting machine which was constructed and used by Thomas G. Plant.

The problems in the lasting of the toe ends of the new types of lasts which were introduced, as I have explained, about 1895 and soon after that time were solved by the inventions of patents 569,182, October 13, 1896, Dunphy, and 569,231, October 13, 1896, Ray. The Dunphy patent 569,182 discloses and claims means used in the reorganized Chase machine for crowding the ends of box toes into their proper place at the ends of the tip seam. Those were the points where the greatest difficulty occurred in the lasting of box toes, as the stock at each end of the tip seam was thicker than at other portions of the toe. Claim 1 of the Dunphy patent is as follows: —

"In a lasting machine, the combination of a toe wiper carriage, and toe wiping instrumentalities with a flexible toe clasp, having at its ends rigid, pivotally connected toe cap pressure blocks, and between its ends a guide extension; and with a facing pad mounted on the face of said flexible toe clasp and of its rigid, pivotally connected toe cap pressure blocks, substantially as and for the purpose set forth."

Prior to the invention of the Ray patent 569,231 it had been necessary for the operator, whenever the shape of the toe of the last next to be operated upon differed substantially from the toe of the last upon which the machine had been operating, to substitute for the toe clasp which he had been using another toe clasp properly shaped to operate upon the new shape of toe. These

clasps prior to the improvement of the Ray patent cost $1.50 each, and it would have been necessary under the changing conditions, with widely varying shapes of toes, for the manufacturer to have had two toe clasps for each shape of last, one for right shoes and one for left. With the improved construction of the Ray patent No. 579,231 it was only necessary for the operator to change the contact piece in the toe clasp, which cost only forty cents each. This Ray improvement is set forth in all of the six claims of patent No. 569,231, October 13, 1896, of which a typical claim is the first: —

"1. As a new article of manufacture, a pad holder for lasting machines, the same comprising a clasp and one or more pad keepers projecting beyond the inner face of the clasp and provided with angular ends substantially as and for the purpose set forth."

It may be of interest to note that the improvement of this patent No. 569,231 was also embodied by Thomas G. Plant in his lasting machine.

Int. 75. State whether or not you have examined the Chase lasting machine in the factory of the Commonwealth Shoe & Leather Company of Whitman which was referred to by Mr. Chapman; if so, please state what class of shoes are being lasted on the machine, and whether or not all the shoes made in that factory are being lasted on those Chase lasting machines. Please state also whether those Chase lasting machines embody the subjects-matter of any of the patents not mentioned by Mr. Chapman which you have stated were in the Chase lasting machine in 1899.

Ans. I have examined the Chase lasting machines in the factory of the Commonwealth Shoe & Leather Company at Whitman which are referred to by Mr. Chapman. I found that those five machines were being used exclusively in the manufacture of long legged boots. The Commonwealth Shoe & Leather Company make a specialty of long legged boots, which are manufactured only in comparatively small numbers at the present time. So far as I can learn there are only ten factories in the country, out of a total of some 1200 manufacturers, in which long legged boots are made at all, and in those factories they constitute only a portion of the

work. The number of long legged boots manufactured is about one-tenth of one per cent of the number of shoes which are made.

The regular work at the Commonwealth Shoe & Leather factory, that is, shoes both high and low, is not being done upon the Chase lasting machine, but is being performed by the thirty-eight No. 5 lasting machines which are in that factory. The No. 5 lasting machine is the present standard bed lasting machine of the United Shoe Machinery Company.

The Chase lasting machines in the Whitman factory embody mechanisms which are set forth in the claims of the following patents: —

No. 569,182, October 13, 1896, Dunphy.

No. 569,231, October 13, 1896, Ray.

No. 571,429, November 17, 1896, Chase.

No. 1,053,612, February 18, 1913, Keyes (application filed December 26, 1908.)

Mr. WEBSTER. Please note petitioner's objection, for reasons heretofore given, to any patent issued after the date of the filing of the petition herein.

Int. 76. What lasting machines other than the Chase machine, if any, were manufactured and put into use by the United Company in the year 1899?

Ans. In addition to the Chase lasting machine the United Company was supplying to manufacturers in 1899 the Ideal lasting machine, McKay & Copeland lasting machine and the hand method lasting machine.

Int. 77. State whether or not after the organization of the United Company machines which generally speaking were of the type of the Chase lasting machine were designed and put out having in them modifications and improvements forming the subjects-matter of Letters Patent of the United Company. State the patents, if any.

Ans. I have previously referred to the development of the industry which took place about 1895 and during the years immediately following and have produced lasts showing a tendency toward more crooked lasts shortly after 1895, the last Defendants'

Exhibit No. 131 illustrating the nearly straight lasts in use prior to 1895, and the last Defendant's Exhibit No. 135 showing a last used from 1899 to 1901, which illustrates the tendency toward more crooked lasts. After 1900 the development of the industry was steadily toward still more crooked lasts. A step in this development is represented by a standard last of 1903, which I now produce.

[*Last of 1903 is introduced in evidence, and marked "Defendants' Exhibit 136".*]

[*Answer to Int. 77 continued:*]

I have placed upon the bottom of this 1903 last a straight line connecting the middle of the toe and the middle of the heel, and also lines which bisect the toe and heel respectively. These lines indicate the crookedness of this last. I also produce a last such as was used in 1905, and I have also marked upon the bottom of this last a line which connects the middle of the toe and the middle of the heel, and also lines which bisect the toe and the heel respectively. These lines indicate clearly the development of the industry toward crooked lasts.

[*Last of 1905 is introduced in evidence, and marked "Defendants' Exhibit 137".*

Model illustrating operation of Chase lasting machine is here introduced in evidence, and marked "Defendants' Exhibit 138".]

[*Answer to Int. 77 continued:*]

The model which I have produced, Defendants' Exhibit 138, will illustrate roughly the difficulties encountered in the lasting of a shoe made upon the last of Defendants' Exhibit 137, on the Chase lasting machine. I should state that of course this model Defendants' Exhibit 138 does not reproduce the elaborate lasting mechanism of the Chase machine. It is intended to illustrate only the action of the toe and heel wipers, but I believe that it correctly represents the difficulties to which I shall refer and in the explanation of which I shall use the model.

I produce a metal pattern for right shoe which is of the same contour as the bottom of the last Defendants' Exhibit No. 137.

[*Metal pattern of right shoe on last of Defendants' Exhibit 137 is introduced in evidence, and marked "Defendants' Exhibit 139".*]

[*Answer to Int. 77 continued:*]

I also produce a metal pattern for a left shoe which is of the same contour as the bottom of the last of Defendants' Exhibit 137.

[*Metal pattern of left shoe on last of Defendants' Exhibit 137 is introduced in evidence, and marked "Defendants' Exhibit 140".*]

[*Answer to Int. 77 continued:*]

On each of these patterns I have placed a rib which represents the rib of an insole, so that for the purpose of demonstrating the models these patterns may be regarded as insoles. In manipulating the model which I introduced, Defendants' Exhibit 138, I place the heel end of the pattern in the recess which illustrates roughly the heel-end lasting mechanism. I then move toward the toe end of the pattern the metal parts of the toe end which illustrate roughly to toe-lasting mechanism. It will be observed that in moving toward the insole the parts of the model which correspond to the wipers of a lasting machine the wiper on the outside of the pattern engages the rib which represents the rib of the insole and stops further movement of the wipers before the wiper on the inside of the pattern engages the channel rib; and after engagement of the wiper on the outside, the wiper on the inside can move no farther and occupies a position at a substantial distance away from the adjacent rib.

It is obvious that in a lasting machine operating in this manner it would be difficult to force the upper materials on the inside of the toe up against the channel rib, as it is important that they should be forced in order that the welt may be properly laid in the angle between the feather edge of the sole, that is, the portion of the sole outside of the rib, and the rib. By way of anticipating demonstration of a model which I shall produce illustrating the operation of the No. 5 lasting machine, the present commercial bed lasting machine of the United Company, I will call attention to the fact that the wipers in this model Defendants' Exhibit No. 138 move in a direction which coincides with the median line of the model, which would be the median line of a machine. This

median line is indicated by broken lines cut in the pattern. The fact that the wipers move on the median line of the machine explains the failure of the inside wiper to operate properly. It will be observed that as the wipers are moved toward the pattern the acting edge of the inside wiper moves in a direction which is not far from parallel with the rib on the pattern.

LASTING MACHINE: No. 5, U. S. M. C.

Soon after the organization of the United Shoe Machinery Company, Mr. Brock, one of the company's lasting machine inventors, conceived that in order to overcome the difficulties which I have explained a bed lasting machine ought to be organized in such a manner that the wipers at the toe should, in their operative movement, move toward the insole rib in a line coinciding with a line bisecting the forepart of the shoe, and that if a machine were so organized the toe-lasting mechanism would operate alike on both sides of the toe. Mr. Brock further conceived that corresponding advantages would be obtained if the heel-lasting mechanism, including the wipers and heel bands, were made to operate in a direction which should be likewise coincident with a line bisecting the heel end of the shoe, and he also conceived that the accomplishment of these desirable results at both the toe and the heel could be secured by arranging the toe and heel mechanisms so that they would be relatively movable about a pivot located approximately at the point where the line bisecting the toe intersects the line bisecting the heel.

I now produce a model which illustrates this characteristic mode of operation of the new machine which was developed by Mr. Brock, and which, in its commercial form, became known as the "No. 5 Lasting Machine", the official name of which is "Lasting Machine No. 5, U. S. M. C."

[*Model illustrating operation of United Company's present commercial bed lasting machine No. 5 is introduced in evidence, and marked "Defendants' Exhibit 141".*]

[*Answer to Int. 77 continued:*]

This model, like that which I have produced illustrating the

operation of the Chase machine, is not intended to illustrate the elaborate lasting mechanism of the No. 5 lasting machine, but only to show the manner of operation of the heel and toe wipers. While the wiper plates of this model may be reversed, it happens now to be adjusted for a right shoe, and I shall therefore use Defendants' Exhibit No. 139, pattern of the last of Defendants' Exhibit 137, showing the 1905 last, in demonstrating the model, this being the same pattern which I used in demonstrating the model of the Chase lasting machine.

In illustrating with this model the operation of the No. 5 lasting machine I place the heel end of the pattern in the recess representing roughly the heel-lasting mechanism; then swing the heel-lasting mechanism until the toe is brought into proper relation to the toe-lasting mechanism, after which I move the toe-lasting mechanism into operative position. In moving the wipers forward it will be noted that they move on the line scratched on the pattern which bisects the toe end of the pattern: that the wipers move alike in the same manner on each side toward the rib on the pattern, and that at the extreme forward position of the wipers they are in substantial engagement with the rib on both sides. This construction in the commercial machine insures that the upper materials shall be crowded properly into the angle between the rib and the feather edge on both sides of the toe, on the inside of the shoe in the same manner and as well as on the outside.

Referring now to the lasting of the heel end of the shoe, and placing the pattern of Defendants' Exhibit 139 again in the model Defendants' Exhibit 138, it will be observed that when the wipers at the heel end are moved toward the last the wiper on the outside of the pattern advances over the edge of the pattern well toward the middle of the heel before the forward end of the wiper on the inside has reached the pattern at all. This difficulty was overcome in the commercial Chase lasting machine to a considerable extent by making the wipers in rights and lefts, but even that did not secure their proper operation, owing to the fact that their movement is on the median line of the machine indicated by broken lines on the pattern, and not, as it should be, to secure uniform

operation for both sides of the heel, on the median line of the heel of the last.

Again, inserting the pattern of Defendants' Exhibit 139 in the model Defendants' Exhibit 141 illustrating the operation of the No. 5 lasting machine and moving the heel-lasting plates toward the shoe, it will be observed that these move in the median line of the heel end of the last and operate just alike on both sides of the heel.

The improved heel-lasting mechanism embodied in the No. 5 lasting machine and illustrated roughly in the model Defendants' Exhibit No. 141 was of great advantage in lasting the heel ends of crooked lasts. In the machine the heel-lasting mechanism includes a heel band which, as I have explained in discussing the Chase lasting machine, is the means which crowds the upper materials against the sides of the last. It was extremely difficult in the use of the Chase machine to crowd upper materials, including the stiff counter, properly into engagement with the side of the last on the inside of the shoe, as the prevailing style of lasts which have been used since soon after 1900 are so shaped in the region just forward of the heel that at least as much pressure must be exerted upon the upper materials in that region as upon the upper materials at the corresponding point on the outside of the last. In the operation of the Chase machine the heel band in operating upon a last, such as is shown in Defendants' Exhibit 137, will engage the outside of the last just forward of the heel and come to rest before the end of the heel band on the opposite side, that is, the inside, has reached the last, and in fact when it is at some distance from the last.

The No. 5 lasting machine as first put out was constructed as shown in the drawings of patent No. 1,018,477, February 27, 1912, Brock (application filed October 26, 1907).

The distinguishing characteristics of the organization of this machine which I have been discussing are set forth in many claims of this patent, of which a typical claim is the first: —

"1. A machine for use in lasting shoes and boots, comprising lasting devices for acting upon opposite ends of the last, constructed and arranged for relative movement about a center approxi-

mately at the intersection of the median line of the heel part and the median line of the forepart of the last."

Nearly all of the one hundred and sixteen claims of this patent No. 1,018,477 define mechanisms which are embodied in the commercial No. 5 lasting machine which was first put out for commercial use in January, 1908, being known officially as "Lasting Machine No. 5, U. S. M. C."

The claims of patent No. 1,066,374, July 1, 1913, Brock (original application filed October 26, 1907), define the general organization of the No. 5 lasting machine in terms of the means for supporting the last. Most of the nineteen claims of this patent define the organization of the No. 5 lasting machine, and a typical claim is the first: —

"1. In a machine of the class described, the combination with a support for one end of a last, of a support for the other end of the last, constructed and arranged for movement laterally about a center located approximately at the point of intersection of the median lines of the forepart and the heel part of the last."

Experimental word by other inventors which constitutes steps toward the invention finally developed in commercial form by Mr. Brock is illustrated and defined in the claims of patents No. 1,017,124, February 13, 1912, Winkley and Alley (application filed April 29, 1896), and No. 1,018,025, February 20, 1912, Winkley and Alley (application filed July 22, 1896).

Many of the claims of these two patents define in broad terms inventions embodied in the No. 5 lasting machine.

A typical claim of patent No. 1,017,124 is the nineteenth: —

"19. The combination with toe lasting mechanism, of a toe rest and a heel support arranged for lateral curvilinear adjustment relatively to cause the median line of the foreparts of lasts having different degrees of swing to coincide with the median line of the machine."

A typical claim of patent No. 1,018,025 is the twenty-seventh: —

"27. A lasting machine, comprising heel lasting mechanism including a heel embracing band, and means, independent of the shoe, constructed and arranged for effecting a lateral adjustment of the band into different positions to cause the band to act uni-

formly upon the two sides of the heel of a right or left shoe in the direction of the median line of the heel part."

The present commercial organization of the heel-band mechanism which was adopted in March, 1909, and constituted a distinct improvement in the machine, rendered the heel band self-adaptable to variations in the contours of the side faces at the heel end of the last.

The utility of mechanism which will shape itself to the heel ends of modern lasts will be obvious upon inspection of the heel end of a last which I now produce, which was used in 1907 and 1908 and which is typical of the unsymmetrical heel ends of modern lasts.

[*Last of 1907–1908, illustrating unsymmetrical heel ends of modern lasts, is introduced in evidence, and marked "Defendants' Exhibit 142".*]

[*Answer to Int. 77 continued:*]

This self-adapting heel mechanism is broadly defined in the claims of reissue patent No. 13,292, reissued September 19, 1911, of which the twelfth claim is typical: —

"12. In a lasting mechanism, the combination of an end embracing band, endwise movable bars acting on the band at opposite sides of the machine, an actuator, and an equalizing slide movable transversely of the machine."

Mr. Brock's improvements over the Snow invention are defined in the claims of patent No. 1,002,818, September 12, 1911, Brock. A typical claim of this patent is claim 30: —

"30. An end lasting mechanism having, in combination, an end embracing band, means for advancing the band ends longitudinally of the shoe and additional means movable transversely of the shoe and having its position controlled automatically by the work to effect equal band end closing pressure against the two sides of an unsymmetrical shoe."

All but one of the thirty-four claims of this patent No. 1,002,818 define mechanisms which are embodied in the commercial No. 5 lasting machine. This same mechanism which is disclosed in patent No. 1,002,818 embodies the subjects-matter of a number of claims in patent No. 958,280, May 17, 1910, Plant, of which a typical claim is the fiftieth: —

"50. In a lasting machine, shoe supporting means, end wipers, a pad, slide bars for supporting the end of the pad, means to advance said slide bars and means automatically conformable to the shape of the last to swing said slide bars toward or away from the pad."

A feature of this machine which contributes to the convenience of the operator, and therefore increases the capacity of the machine, and which has been in the machine since it was first put out for commercial use, is defined in the terms of reissue patent No. 13,505, reissued January 7, 1913, Glass, of which a typical claim is the thirteenth: —

"13. In a lasting machine, the combination with a heel lasting carriage adapted to move to and from a lasting position, of a jack post, means for retracting said jack post relatively to the carriage and for holding the same in its retracted position, and means automatically to release said jack post on the return of said carriage from its lasting position."

The claim which I have quoted is the same as claim 15 of the original patent No. 957,949, which was granted on May 17, 1910, to Glass' assignee, Thomas G. Plant.

This No. 5 lasting machine contains mechanisms defined in the claims of many other patents, the number of patents setting forth the organization of this machine being over twenty. As I have stated, the work of the No. 5 lasting machine was much superior to that done on the Chase lasting machine, and the great improvement in the quality of the work constituted the chief advantage of the No. 5 lasting machine over the Chase lasting machine. However, in addition to the superior quality of the work, the improvements which have been incorporated in the No. 5 lasting machine which enable it to do better work more rapidly, and which contribute to the convenience of the operator in using the machine, have given this No. 5 lasting machine an increased capacity of more than fifteen per cent over the capacity of the Chase lasting machine.

After manufacturers became acquainted with this No. 5 lasting machine the company was overwhelmed with orders. In February, 1911, the company was over 400 machines behind in its orders for No. 5 lasting machines, although it was building and shipping the

machines as fast as the facilities of its manufacturing plant would admit. For example, in April, 1911, the company shipped 208 machines. At no time since the machine was introduced has the company been able to catch up with its orders, and even as late as August, 1913, which is the date of the last report I have, the company was eighty-two machines behind in filling its orders. On that date, 4204 of these No. 5 lasting machines had been shipped. On December 1, 1911, over 3000 of these machines were in use in shoe factories.

From the beginning the No. 5 lasting machine has been adapted for lasting either men's or women's welt shoes. It has superseded the Ideal lasting machine as well as the Chase lasting machine, and it is now the standard commercial bed lasting machine supplied to manufacturers by the United Shoe Machinery Company.

At the present time the No. 5 lasting machine embodies mechanisms set forth in the claims of the following patents: —

No. 552,834, January 7, 1896, Grandy.

No. 569,231, October 13, 1896, Ray.

No. 571,429, November 17, 1896, Chase.

No. 588,568, August 24, 1897, Grandy.

No. 601,934, April 5, 1898, Brock.

Reissue No. 13,505, January 7, 1913, Glass (original patent 957,949, May 17, 1910).

No. 958,280, May 17, 1910, Plant.

No. 1,002,818, September 12, 1911, Brock (original application October 16, 1909).

Reissue No. 13,292, September 19, 1911, Snow.

No. 1,004,659, October 3, 1911, Keyes (application filed January 22, 1910).

No. 1,017,124, February 13, 1912, Winkley and Alley (application filed April 29, 1896).

No. 1,018,025, February 20, 1912, Winkley and Alley (application filed July 22, 1896).

No. 1,018,477, February 27, 1912, Brock (application filed October 26, 1907).

The above Letters Patent are all owned by the United Shoe

Machinery Company. This machine was put out by the United Shoe Machinery Company through its lasting department.

Mr. WEBSTER. Counsel for both parties having been temporarily called out for conference with the court, it is hereby stipulated that all evidence to which the petitioner might have objected at the time it was offered may be objected to now with the same force and effect as if objection was entered at the time the same was offered or being presented. And in pursuance of such stipulation, counsel for petitioner asks that objection be noted to the introduction of any patents and to the introduction of any testimony with reference to any patent or structure of any patent not issued before, or the title of which was not procured before, the filing of the petition herein.

Int. 78. You have referred to the McKay-Copeland lasting machine, the Ideal lasting machine and also to the hand method lasting machine. State as briefly as possible the history of the development of each of these machines, giving the Letters Patent under which the same were manufactured from time to time.

Mr. WEBSTER. In order to save interjecting objection during the taking of the testimony of the witness, petitioner asks that it be noted that the petitioner objects to evidence relating to patents and structures shown in patents, and to the introduction of patents issued or procured, after the date of the filing of the petition herein, on the ground that the same is inadmissible, incompetent, and as not affecting any of the issues involved in this case.

LASTING MACHINE: MCKAY & COPELAND.

Ans. Referring first to the McKay-Copeland lasting machine, that, like the Chase lasting machine, was of the bed type, that is, it comprised means for supporting the last at the heel and at the toe with a toe clasp and wipers at the toe arranged to last the upper around the toe, and a heel band and wipers at the heel arranged to last the heel portion of the shoe. Prior to 1899 and ever since the machine was and has been used exclusively on the heaviest kinds of shoes, that is, shoes having their soles attached with pegs, standard screw wire or nails.

I produce a sample of a shoe lasted on a McKay-Copeland lasting machine, which is a fair illustration of the quality of the work for which that machine is used, and for which alone it is adapted for use.

[*Shoe lasted on McKay-Copeland lasting machine is introduced in evidence, and marked "Defendants' Exhibit 143".*]

[*Answer to Int. 78 continued:*]

The McKay & Copeland lasting machine is more than twice as heavy as either the Chase or the Ideal lasting machine and its organization, which especially adapts it for lasting very heavy shoes, is such that it could not possibly be used with commercial success for the lasting of the better grades of men's welt shoes for which the Chase lasting machine was the standard lasting machine in 1899, and much less could it be used for lasting women's welt shoes, practically all of which were, so far as they were lasted by machine, lasted on the Ideal lasting machine in 1899.

The patents which define mechanisms embodied in the McKay & Copeland lasting machine in February, 1899, were as follows:—

No. 548,671, October 29, 1895, Stirckler.

No. 548,862, October 29, 1895, Brock.

No. 601,933, April 5, 1898, Brock.

No. 601,935, April 5, 1898, Brock.

No. 1,030,564, June 25, 1912, Brock (application filed July 19, 1898).

The McKay & Copeland lasting machine, or a machine known by that name, was put out for many years prior to February, 1899. In 1895 it had, like the Chase lasting machine, undergone a thorough reorganization to adapt the machine to meet the radically changed conditions caused by the changes which were made in lasts about 1895 and which constituted the beginning of the development in lasts which resulted in the modern lasts used exclusively for the past ten or twelve years.

To adapt the McKay & Copeland machine for lasting the right and left shoes on crooked lasts, both the heel mechanism and the toe mechanism of the machine were entirely reorganized. Referring, first, to the new toe-lasting head which was adopted in the

reorganized machine, experimental work in its development is represented by patent No. 548,671, October 29, 1895, Stirckler. The organization of the new toe-lasting head which was adopted in 1897 is set forth broadly in the eighth claim of the patent No. 548,671, which is as follows: —

"8. In a machine for lasting boots or shoes, wiper plates made adjustable about a centre located in a line drawn centrally from the extremity of the toe backward along the sole to thus place the edges of the said plates at like distances from the edges of the toe of the last whether a right or left, and means to move the said wiper plates forward to act substantially simultaneously and uniformly on the upper to wipe the same over the last, substantially as described."

The commercial construction of the new toe-lasting head as it was adopted in 1897 is shown in patent No. 601,933, April 5, 1898. All of the thirteen claims of this patent set forth features of the construction of the machine and of these claims the third is typical: —

"3. A lasting machine for use in lasting boots and shoes, containing a support for the last, an end lasting mechanism, constructed and arranged to permit relative and automatic movement of said last, an end lasting mechanism to enable the lever to act in a direction corresponding to the direction in which the end of the last faces, substantially as described."

[*Adjourned to 10 A. M., Friday, October 10, 1913.*]

BOSTON, MASS., October 10, 1913.

[*Answer to Int. 78 continued:*]

This new toe-lasting organization as shown in this patent No. 601,933, and as defined by its claims and different claims of the two earlier patents to which I have referred, represented so important an improvement in the machine that within two years after its adoption, and prior to February, 1899, practically all manufacturers who were using the old type of McKay & Copeland lasting machine had purchased from the Consolidated & McKay Lasting Machine Company, the company which put out the McKay & Copeland lasting machine, new toe-lasting heads at a cost of $150 each, and had had those new heads applied to their machines.

Simultaneously with the development of this new toe-lasting organization, Mr. Brock, the inventor who was at work improving his machine, was experimenting on an improved heel-lasting organization to adapt the machine for lasting properly the heel ends of right and left shoes made on crooked lasts. This heel-lasting organization as commercially adopted was constructed as shown in the drawings and set forth in the claims of patent No. 1,030,564, June 25, 1912, Brock, granted on an application filed July 19, 1898. The inventions defined by all of the seventy-one claims of this patent have, since their adoption in 1899, always been embodied in this machine. Typical claims are the following: —

"36. In a lasting machine, end lasting devices automatically adjustable to meet the right and left swing of lasts, and means co-operating with the side of a last to determine such automatic adjustment of said lasting devices, said means being constructed and arranged for automatically varying the right and left adjustment of said lasting devices according to the peripheral variation between the bottom of the last and the body section thereof above the bottom, for the purpose specified."

"46. In a machine of the class described, a clasp to embrace the end of the last, and means to sustain the free ends of said clasp whereby as the clasp is closed on the last its ends are compelled to roll on the sustaining means and adapt themselves to the configuration or inclined sides of the last."

"65. A lasting machine having, in combination, a flexible end lasting pad conformable to the end of a shoe, pad presenting means, and wipers, and additional means for simultaneously moving the said wipers and lasting pad for lasting the upper."

The experimental work on this heel-lasting head began in 1895 and one of the experimental constructions constituting a step in its development is illustrated in patent No. 601,935. The commercial construction embodies an important improvement set forth in claim 13 of this patent, which is as follows: —

"13. In a lasting machine, the combination with the swinging wipers and actuating means to open and close the same, of positioning means co-operating with the last to swing the said wipers, or either of them into starting position prior to movement of the same by said actuating means, substantially as described."

This reorganized heel-lasting head was, like the toe-lasting head,

received with great favor by shoe manufacturers and prior to February, 1899, practically all manufacturers had voluntarily had these new heel-lasting heads applied to their old machines, paying $150 each for the heads which they obtained from the Consolidated & McKay Lasting Machine Company.

The importance of the improved toe and heel lasting organizations which constituted the improvements of the patents which I have been discussing, may be judged from the fact that prior to 1899 practically all manufacturers who were using the McKay & Copeland lasting machines had had their machines substantially rebuilt by the substitution of the new toe and heel lasting heads, for which they had paid $300 for each machine to the Consolidated & McKay Lasting Machine Company.

The other important improvements which were made for, and adopted in, this machine had to do with the side-lasting mechanism of that machine. The McKay & Copeland machine was in 1899, and still is, provided with side-lasting straps which wrap around the shoe and are operated to stretch the upper over the ball and shank of the last and to carry the edges of the upper in those portions of the shoe over the edge of the last into lasted position. In lasting shoes on modern lasts, which as I have fully explained were, each year after 1895, becoming more and more crooked, it was found that the lasting straps of the old machine would not operate properly on the shanks and balls of shoes made on those crooked lasts. In 1901 there was adopted new side lasting mechanism by which these side-lasting straps were enabled to adapt themselves properly to the rights and lefts of crooked lasts. This improvement is shown in its commercial form in patent No. 823,664, June 19, 1906, Brock (application filed June 13, 1903). The improvements defined in all of the eighteen claims of this patent have, since 1901, been incorporated in the commercial machine and the majority of manufacturers using the machines which they had prior to the adoption of this improvement have had their machines equipped with the mechanisms shown and set forth in the claims of that patent No. 823,664. Claim 1 is typical: —

"1. In a machine of the class described, straps for encircling the

last and folding the edges of the upper over the last upon its opposite sides, in combination with means for automatically causing the straps to act uniformly on the shoe at the two sides of the last."

This machine is still being put out by the United Shoe Machinery Company through its lasting department for the lasting of very heavy shoes such as the shoe of Defendants' Exhibit 143. It is never used on medium or high grade shoes. The present commercial machine is constructed as set forth in the claims of the following patents: —

No. 601,933, April 5, 1898, Brock.

No. 601,935, April 5, 1898, Brock.

No. 823,664, June 19, 1906, Brock.

No. 1,030,564, June 25, 1912, Brock (application filed July 19, 1898).

LASTING MACHINE: IDEAL.

In addition to the Chase lasting machine and the McKay & Copeland lasting machine which I have discussed in my previous testimony, there was being put out in February, 1899, another type of bed-lasting machine known as the "Ideal" lasting machine. This machine was first put out for commercial use in May, 1895. It was especially designed for the lasting of women's welt shoes and in February, 1899, substantially all women's welt shoes which were lasted by machine were being lasted upon the Ideal lasting machine.

The commercial Ideal lasting machine as it was being put out in February, 1899, was constructed almost identically as shown in patent No. 552,834, January 7, 1896, Grandy. Two important features of the organization of the machine are defined in the claims of this patent No. 552,834. One of these features was the organization of the toe-lasting mechanism, which provided for lateral tipping of the wipers to adapt them to the plane of the bottom of the last at the toe and permitted the location of the axis upon which they turn substantially in the plane of the last bottom. This organization permitted the adjustment of the plane in which the wipers moved to accord with the plane of the bottom of the last at the toe, without changing the general relative position of

the wipers and the last bottoms at the toe. A typical claim of patent No. 552,834 directed to this improvement is the first: —

"1. In a lasting machine head, the combination of a base longitudinally pivoted, and adjustable, a sleeve supporting toe lasting mechanism mounted to revolve transversely thereon, lasting mechanism centrally mounted upon said sleeve, and worm and gear mechanism to revolve and hold said sleeve substantially as shown and described."

The importance of the improvement defined in the claim which I have just quoted may be judged from the fact that this organization was incorporated and has always been used in the No. 5 lasting machine and it was also used in the Plant lasting machine.

Another Important improvement which was incorporated in the Ideal lasting machine as it was put out in February, 1899, is set forth in the seventh claim of this patent No. 552,834, as follows: —

"7. In a lasting machine, the combination with the heel supporting band thereof, of supporting and operating slide bars, bell crank levers mounted thereon, carrying the heel supporting band substantially as described, inclines on said slide bars which act against the outer sides of the guide grooves and maintain the angular position of said bell crank levers for the different variations of shape and size of heel, substantially as shown and described."

The organization defined in this claim 7 was intended and adapted to enable the machine to last properly the heel ends of the more crooked lasts which were beginning to be used at that time when the Ideal lasting machine was first put out for commercial use. This organization enabled the machine to last with commercial success the heel ends of shoes made on the lasts which were being used in 1895 and which incorporated the changes which constituted the beginning of the development of modern lasts as used during the past twelve or fifteen years.

This heel end lasting mechanism of the Ideal lasting machine was set forth in broader terms in the first claim of patent No. 558,043, April 14, 1896, Copeland, Crisp, Grandy and Avery (application filed May 23, 1892).

This patent, although granted subsequently to patent No. 552,834, describes an improvement which was made before the improve-

ment of No. 552,834. Claim 1 of patent No. 558,043 is as follows: —

"1. In a lasting machine head of the class described, the combination of the band L, the slide bars g^1, the equalizing bar A, the spring connections h^3, and suitable connecting and operating mechanism, substantially as shown and described."

As used in 1899, the Ideal lasting machine also embodied the toe rest construction defined broadly in claim 26 of patent No. 571,429, November 17, 1896, Chase, which is as follows: —

"26. In a lasting machine, the combination of an end lasting mechanism with a toe rest which moves with the shoe in the direction of the length thereof by contact therewith, substantially as and for the purpose set forth."

The specific construction of the toe-rest mechanism of the Ideal lasting machine which adapted it particularly for women's welt shoes, for which, as I have explained, the machine was especially designed, is defined in claim 8 of patent No. 521,954, June 26, 1894, Grandy, which is as follows: —

"8. In a lasting machine, a toe rest or support provided with a longitudinal reciprocating contacting face, substantially as shown and described and for the purpose set forth."

The toe-rest mechanism as defined in the claim just quoted was of advantage in the machine because it prevented scarring of patent leather shoes, and the discoloring of russet shoes, by relative movement of the toe rest and the shoe. The improvement was of particular utility, also, in a machine which operated in the manner characteristic of the Ideal lasting machine because it prevented the formation of a fulness in the upper, back of the toe.

In addition to the eighth claim of patent No. 521,954 which has been quoted, that patent contained a number of other claims setting forth other features of the commercial Ideal lasting machine.

This machine, like the Chase lasting machine, was superseded in January, 1898, by the machine officially known as the "Lasting Machine No. 5, U. S. M. C." The Ideal machine, like the Chase machine, was not adapted for satisfactory work in lasting shoes made upon modern lasts such as have been used in the past eight

or ten years, the development of which into the crooked lasts so generally used today took place gradually between about 1895 and 1905. The explanation which I have made my previous testimony of the defects of the Chase lasting machine in the lasting of shoes on present day lasts, with the assistance of a model showing operation of that machine and of a pattern of the bottom of a crooked last, applies equally well to the Ideal lasting machine. After manufacturers were able to get the No. 5 lasting machine there was no demand at all for Ideal lasting machines.

Hand-Method Type of Lasting Machine.

At the beginning of my testimony in regard to the Chase lasting machine I explained in some detail the general differences between the bed type of lasting machine and the hand-method type of lasting machine. As I stated there, in the hand-method type of lasting machine the upper is worked over the last and automatically secured in lasted position by a step-by-step operation, the machine operating successively upon different portions of the shoe. The Consolidated hand method lasting machine which was being put out about February, 1899, was of this hand-method type. Generally speaking, the machine comprises grippers, wipers and tack mechanism, all operating automatically to grip the upper, wipe it over the bottom of the insole, and tack it in position. The machine got its name from the fact that its automatic operation is approximately the same as that of the hand laster. The grippers of this machine are organized to plait the upper around the toe, that is, to fold it, as is necessary to take care of the fulness of the upper around the curved toe and as is always done by the hand workman with his hand pincers in lasting around the toe.

Lasting Machine: Consolidated Hand Method (McKay).

The hand method lasting machine was the standard machine for lasting McKay sewed shoes, both men's and women's, in February, 1899. A large number of the machines were in use, and substantially all McKay sewed shoes which were lasted by machine in 1899 were being lasted upon the hand method lasting machine.

This was because the hand method machine had a capacity more than twice the capacity of any commercial lasting machine of the bed type, and the McKay sewed shoe manufacturers could not afford to use, and did not use, the slower machines of the bed type.

The commercial hand method lasting machine as put out just prior to February, 1899, was constructed substantially as shown in patent No. 584,744, June 15, 1897, Ladd and McFeely, except that the machine was not provided with some of the features of the organization of the machine shown in that patent which were particularly designed for adapting the hand method lasting machine for welt work. Prior to the adoption on the machine in 1898 of the inventions defined in the claims of this patent 584,744, and of other patents to which I shall refer later, the machine had been successful only on the cheaper grades of McKay shoes. Before that time the machine had been built substantially as shown in patent No. 423,922, March 25, 1890, Gooding and Ladd, although the machine shown in the patent No. 423,922 had been substantially improved by incorporating in it mechanisms defined in the claims of a number of patents of which the more important were No. 500,141, June 27, 1893, Ladd, and No. 510,973, December 19, 1893, Ladd.

The first of these patents relates to the means for controlling the plaiting mechanism of the machine, while the second of these patents defines in its claims an improvement in the mechanism for opening and closing the grippers, which, for the first time, rendered that mechanism entirely satisfactory in its operation, and which has been used continuously in substantially the same form to the present day.

A further step toward the commercial machine of 1899 was defined in the claims of patent No. 510,977, December 19, 1893, Ladd, which shows an improved mechanism for imparting the updraw movement to the grippers, and by patent No. 562,119, June 16, 1896, Carter, which defines in its claims the double-edge gauge adopted in 1895, comprising a thin gauge which would reach into the shank of the shoe, and a thick gauge such as is

needed to afford the necessary broad bearing for the work at the toe and the heel.

In the organization of the 1899 machine for slitting the upper around the toe of the heavier types of shoes, to facilitate the necessary plaiting or folding of the upper it is necessary at the toe to provide for the fulness which must be gathered in around the toe. Claim 1 of patent No. 564,931 is as follows: —

"1. In a lasting machine, in combination, upper working devices, a cutter mechanism including a plurality of cutter blades supported suitably for cutting the upper at opposite sides of the upper working devices, the blades being separately movable, and actuating appliances arranged for moving the cutter blades to cut the upper in different time relations, substantially as described."

The single claim of patent No. 584,742 defines the commercial construction used in the machine.

The machine shown in patent No. 423,922, modified and added to by the inventions of the later patents which have just been discussed, did acceptable work on the cheaper grades of McKay shoes, but, despite the effort to get this machine into factories making the better grades of McKay shoes, it was never successful on that class of work, and although tried many times in factories making the better grades of McKay shoes, it never stayed long in any of those factories, as the manufacturers would not use it on the better class of McKay work. Accordingly, as a result of experiments beginning in 1895 with the object of improving the quality of the work of the machine and extending its field to the better grades of McKay work, the machine was, about 1898, entirely reorganized by incorporating in it the improvements set forth in the claims of patent No. 584,774, June 15, 1897, Ladd and McFeely, to which I have previously referred as showing substantially the commercial machine of 1899 and also the improvements set forth in the claims of patent No. 597,321, January 11, 1898, Ladd.

The improvement set forth in the claims of patent No. 584,744, June 15, 1897, which was adopted in the hand method lasting machine for McKay sewed work, and which revolutionized that machine, was the organization which imparted to the grippers a

combined lateral and turning movement in the plaiting or folding movement of the grippers in lasting around the toe. Prior to this improvement the plaiting of the upper had been effected solely by a lateral or sidewise movement of the grippers. When, by embodying in the commercial machine, the improvement of patent No. 584,744, this plaiting movement was made a combined lateral and turning movement, the machine, for the first time, really approximated in its operation hand method lasting and justified its name. Typical claims of this patent No. 584,744 defining this improvement are 1 and 36, which are as follows: —

"1. A lasting machine having pincers for holding the upper, and means for pulling the upper held thereby, combined with means for moving the pincers forwardly over the last and laterally and turning the pincers, the pincers holding the upper continuously during said movements, substantially as described."

"36. A lasting machine of the character indicated, having devices for holding the upper, and devices for stretching the upper held thereby, combined with means for turning and shifting the positions of said devices relatively to the last whereby the upper is twisted with relation to the edge of the last and carried forwardly and laterally over the same, and strained continuously during said operations, substantially as described."

This organization defined in the foregoing claims was adopted in the commercial machine of 1899. At the same time there was incorporated in the machine the improvement defined in the eleven claims of patent No. 597,321, January 11, 1898, Ladd. The object of this invention was to adapt the machine for driving the tacks at an inclination to the plane of the insole so that as the tacks passed through the upper into the last they would tend to draw the upper material into the last they would tend to draw the upper material tighter. The disadvantages of driving the tack in a direction perpendicular to the facing of the insole was that just before the tack is driven the grippers let go and there is a tendency for the upper stock to slip back. Accordingly, a loose portion of upper was frequently found between the tack and the edge of the insole. When the tack was driven at an inclination the oblique movement of the tack overcame any such tendency of the upper to slip back. A typical claim of this patent No. 597,321 is the sixth: —

"6. A lasting machine, having a fastener inserting mechanism, and a shoe resting mechanism, said mechanisms being relatively disposed for resting the shoe for receiving the fastener with the plane of the fastener receiving part of the shoe inner sole oblique to the line of movement of the ingoing fastener, substantially as described."

The machine as reorganized by the inventions of patent No. 584,744 and No. 597,321 was found to be adapted for the lasting of all grades of McKay sewed shoes. The manufacturers of the machine, the Consolidated & McKay Lasting Machine Company, offered shoe manufacturers who were using machines of the old type an opportunity to exchange the heads of their old machines for reorganized heads embodying the improvements set forth in these patents, upon payment of fifty dollars for each new head, a sum which was considerably less than the cost of manufacturing the new head. I should, perhaps, explain that the head of the machine is the entire machine except the supporting column and the starting and stopping mechanism in the base of the machine. Practically all manufacturers who had old machines accepted this offer, so that in a short time nearly all machines in use embodied the improvements of these patents No. 584,744 and No. 597,321.

This hand method lasting machine for McKay sewed shoes has been substantially improved since February, 1899. The first improvement comprised means for changing the tension exerted in the updraw movement while the work progressed. It might be well to explain that the grippers of the machine are given this updraw movement to stretch the upper, and then an overdraw movement to lay the edge of the upper down upon the insole. This improvement is defined in all of the sixteen claims of patent No. 893,331, July 14, 1908, Ladd (application filed April 13, 1901). Claim 1 of this patent is typical:—

"1. A machine for working an upper over a last, comprising grippers for gripping the upper, actuating mechanism for the grippers including a yielding element, means for initially adjusting the actuating mechanism to determine the tension of said yielding element, and independent means under control of the workman for directly changing the tension of said yielding element to modify the pulling tension of the grippers."

The next change in the machine was a reorganization of the grippers which, as previously used, were shown in the patent No. 510,977, December 19, 1893, Ladd. The grippers mechanism of that patent was unsatisfactory because it involved inconvenience in getting the stock in between the two jaws of the grippers and did not hold the stock securely while the two jaws were pulling the upper. The important improvement over that construction, which was adopted during 1899, is accurately shown in the drawings and set forth in the claims of patent No. 1,005,234, October 10, 1911, Ladd and Stiggins (original application filed March 20, 1901).

The distinctive characteristic of the organization of the new grippers mechanism of this patent is that the movable jaw was operated in such a path that in each closing movement it reached out and gathered in the upper, as is well illustrated in Fig. 1 of the drawings of the patent. Of the thirty-eight claims of the patent, all of which define improvements embodied in the commercial grippers mechanism adopted late in 1899 and used ever since, a typical claim is the first :—

"1. In a machine for working an upper over a last, a grippers mechanism comprising a pair of jaws and means whereby one of said jaws may be moved relatively to the other to close the grippers, in combination with means for causing said movable jaw, in its movement to close the grippers, to reach out and gather in the upper."

Another important improvement made in the machine of 1899 was the change in its organization by which the machine was adapted to supply and drive either a long tack or a short tack as required by the particular operation of the stock being operated upon. I produce a McKay sewed shoe which has been lasted upon the hand method lasting machine.

[*McKay sewed shoe lasted on hand method lasting machine is introduced in evidence and marked "Defendants' Exhibit 144".*]

[*Ans. to Int. 78 continued:*]

On inspection of this shoe it will be seen that the upper materials lasted in at the toe and at the heel are thicker than the upper materials along the shank and ball of the shoe. This additional thickness is due at the toe to the edge of the box toe which constitutes

a part of the upper materials at the toe, and at the heel to the edge of the counter or stiffening piece. Prior to the improvement set forth in the claims of patent No. 999,233, August 1, 1911, Ladd and Stiggins (application filed March 20, 1901), the hand method lasting machine for McKay work had been so organized that it could drive but one length of tack. It is desirable, however, owing to the increased thickness of the upper materials of the toe and heel, that a longer tack be driven by the machine in lasting the toe and heel. On the other hand, it is undesirable to use a long tack in the shank and forepart, because in the use of a long tack there would be too long a point to clinch on the inside of the insole; the long clinched point would interfere with the operator of the McKay sewing machine in attaching the out-sole, since in the sewing operation the thread would frequently be abraded or broken by the long clinched points, and such extra long points on the inside of the shoe are also likely to cause discomfort to the wearer of the shoe because the points are liable to work up in the wear of the shoe and get into the foot of the wearer.

The difficulties to which I have referred were entirely overcome when the improvements of patent No. 999,233 above mentioned were incorporated in the machine. These improvements comprise providing the machine with mechanism for supplying tacks of different lengths, one length being that required at the heel and toe, and the other length being a shorter tack of just the right length for the forepart and shank, and connecting this tack-supplying mechanism with the edge-gauging mechanism which must be changed at the heel and at the toe, so that as the operator changed the edge-gauging mechanism he would be obliged at the same time, by the connections between the edge-gauging mechanism and the tack-delivering mechanism, to adjust the machine for delivering the right length of tack for the particular part of the shoe upon which he was operating. The operator was thus effectually prevented from using a tack of improper length for the part of the shoe which he was lasting. This improvement is set forth in all of the fifteen claims of patent 999,233 of which claims 7 and 8 are typical:

"7. In a machine of the class described, mechanism for supply-

ing fastenings of different kinds, a plurality of relatively movable rests, and means actuated by relative movement of said rests for causing said mechanism to stop supplying fastenings of one kind and supply fastenings of another kind.

"8. In a machine of the class described, a tack delivering mechanism arranged to deliver tacks of different sizes, a thin edge rest occupying a fixed position, a thick edge rest, means for moving said thick edge rest toward and from operative position, and means actuated by a movement of said thick rest for causing said tack delivering mechanism to stop delivering tacks of one size and deliver tacks of another size."

As I stated in explaining the construction of the 1899 hand method lasting machine, it was frequently desired, and often necessary, in lasting McKay sewed shoes made of heavier leathers, to slit the upper in lasting around the toe to permit the folded upper to lie down properly upon the insole. The slitting mechanism of the 1899 machine was designed for the old type of grippers organization in which the grippers were moved laterally, but did not have the combined lateral and turning movement which, when embodied in the machine in 1899, completely revolutionized the machine as I have explained.

Experimental work was begun in 1898 and continued until 1901 with a view to providing the modern machine, in which the grippers had a combined lateral and turning movement, with upper-slitting mechanism which would co-operate properly with that grippers organization.

The very satisfactory organization for this work which was adopted in 1901 is constructed substantially as shown, and as defined, in all of the fifty-two claims of patent No. 931,809, March 28, 1905, McFeely (application filed July 14, 1900). A characteristic of the commercial construction was that the cutter was operated first to engage the upper at a distance from the edge of the upper and then to form the slit by cutting toward and out of the edge of the upper. A typical claim of this patent No. 931,809 is the fortieth:—

"40. In a machine of the class described, the combination with pincers for pulling an upper over a last, and a cutting device, of

means for moving the cutting device in the direction of the pulling strain effected by the pincers to slit the upper."

The general organization of an upper slitting device with grippers which have the combined lateral and turning movements which, as the machine has been organized since 1899, is set forth in broad terms in many claims of patent No. 786,047, March 28, 1905, McFeely (application filed July 14, 1900), which patent shows a stage in the development of the organization which was commercially adopted and shown as I have explained in the Stiggins patent No. 931,809. A typical claim of patent 786,047 is the thirteenth: —

"In a machine for working an upper over a last, pincers for gripping the upper, a cutting device, means for actuating the cutting device to slit the upper, and mechanism for actuating the pincers to grip and stretch the upper and twist it with relation to the slit formed by the cutting device."

The hand method lasting machine for McKay work is the present standard commercial machine of the United Shoe Machinery Company for lasting McKay sewed shoes, and the machine is very extensively used; 4883 hand method lasting machines for McKay work were put out by the United Shoe Machinery Company between March 1, 1899, and March 1, 1913.

There is practically no demand for the bed type of lasting machine for McKay sewed shoes, because the hand method lasting machine for McKay work has practically twice the capacity of a bed lasting machine on that class of work. The machine is put out by the United Company through its lasting department. As it is now being put out it embodies the improvements shown and set forth in the claims of the following patents: —

No. 584,742, June 15, 1897, Ladd.

No. 584,744, June 15, 1897, Ladd and McFeely.

No. 597,321, January 11, 1898, Ladd.

No. 867,469, October 1, 1907, Bond.

No. 893,331, July 14, 1908, Ladd.

No. 931,809, August 24, 1909, Stiggins.

No. 999,233, August 1, 1911, Ladd and Stiggins.

No. 1,005,234, October 10, 1911, Ladd and Stiggins.

No. 1,014,940, January 16, 1912, Bond (application filed May 5, 1908).

LASTING MACHINE: CONSOLIDATED HAND METHOD (WELT).

In February, 1899, the hand method lasting machine was not commercially successful for lasting welt shoes, although experimental work had been going on for several years in the endeavor to adapt a machine for lasting welt shoes, and the stage in that experimental work is represented by some of the improvements which are shown in patent No. 584,744, June 15, 1897, Ladd and McFeely.

The lasting of welt shoes is a very different operation from the lasting of McKay shoes. As shown in Defendants' Exhibit 144, which is a McKay sewed shoe lasted upon the hand method lasting machine for McKay work, the insole of a McKay sewed shoe is flat, and in the lasting of such a shoe it is only necessary that the upper stock be worked properly over the edge of the last, laid down upon the flat insole, and tacked. The insole of a welt shoe, on the other hand, is formed with a channel lip or rib extending all the way around the shank, forepart and toe. The narrow strip between this lip or rib and the edge of the sole is known as the "feather edge". I produce a last having a welt insole tacked to it, which will serve to illustrate the problems which were encountered in the development of a hand method lasting machine properly organized for lasting welt shoes.

[*Last and welt insole attached is introduced in evidence, and marked "Defendants' Exhibit 145".*]

[*Answer to Int. 78 continued:*]

In this Exhibit 145 the feather edge is the extreme edge portion of the insole, and the channel lip which was formed by the insole channeling operation is turned back, as is required for the lasting and welt-sewing operations. In order that the shoe may be in proper condition for the welt-sewing operation, the upper must, in the lasting operation, be forced into the angle formed by the feather edge and the upturned lip, and must be secured in that position. The hand method lasting machine supplied for the last-

ing of McKay sewed shoes had no provision whatever for getting the upper into this angle between the feather edge and the lip, and for securing it in that position snugly against the lip. Not only was the hand method lasting machine for McKay work unsuited for the lasting of welt shoes satisfactorily, but in fact it could not possibly be used commercially for that work.

In the experimental work directed towards the development of a hand method lasting machine for welt work, a few experimental machines were built and tried out in shoe factories which incorporated improvements illustrated and set forth in the claims of patent No. 584,744. The important improvement of that patent, which consisted in the new toe-plaiting organization, comprising grippers having combined lateral and turning movements, has already been discussed in connection with the hand method lasting machine for McKay work. That improvement was also embodied in the experimental hand method machine for welt work, which was tried out before 1889, and in addition improvements especially designed for welt work, which are defined in the claims of that patent, were incorporated in the experimental welt machine. Typical claims setting forth these mechanisms are 16, 44 and 46, which are as follows: —

"16. A machine of the character indicated, having a plurality of separately movable work pressers, and supporting connections permitting movement to place a presser in position desired for bearing upon the overturned upper, combined with means whereby the presser may be placed in or removed from said position when required during the lasting process, substantially as described."

"44. In a lasting machine, the combination of mechanism adapted for feeding and separately delivering different sized tacks and permitting movement whereby it is shifted from delivering one sized tacks to delivering another sized tacks, a tack driving mechanism adapted for driving the tacks to different planes whereby the driven tacks are left with their head ends at different altitudes relatively to the plane or surface penetrated by the body parts thereof, said mechanism permitting movement to change its operation from driving the tacks to one of said planes or altitudes, to the operation for driving tacks to another of said planes or altitudes, and a connection between the feeding and delivering mechanism and the driving mechanism by means of which the shifting of one effects a corresponding shifting of the other, substantially as described."

"46. A lasting machine of the character indicated, having upper lasting appliances for lasting the upper over the last, combined with an auxiliary presser mechanism arranged for use in fulling or crimping the upper, substantially as described."

The importance of the imrovement defined in claim 44 above quoted may be briefly explained in connection with a lasted woman's welt shoe which has been lasted on the hand method lasting machine for welt work as now supplied by the United Company, which I now produce.

[*Woman's welt shoe lasted on hand method lasting machine (welt) introduced in evidence, and marked "Defendants' Exhibit 146".*]

[*Answer to Int. 78 continued:*]

It will be observed that in this Exhibit 146 the tacks around the heel are "driven home", while the tacks around the shank and forepart are not fully driven and their heads are located above the stock. Tacks are always so driven in the lasting of welt shoes, because trade conditions require that all the lasting tacks around the shank and forepart of a welt shoe shall be removed at later steps in the manufacture of the shoe.

The improvements recited in the claims which I have quoted from patent No. 584,774 were embodied in the lasting machine for welt work when it was finally adopted for commercial use, and have been retained in the machine to the present day. This experimental welt lasting machine was also provided with the improvement of patent No. 597,321, January 11, 1898, Ladd. General advantages of the improvement of this patent were pointed out in my previous testimony regarding the hand method lasting machine for McKay work, and those general advantages are also secured by the improvement as embodied in the machine for welt work, and in addition further advantages which are peculiar to welt work. In the commercial welt lasting machine as put out after 1899, the tack-supplying and tack-driving organization drove the tack obliquely into the angle of union of the feather edge and channel lip, which I explained in discussing Exhibit No. 145. This is also illustrated in Fig. 12 of the drawings of patent No. 597,321. Many of the claims of this patent are directed to the organization for welt work, a typical claim being the second: —

"2. A lasting machine, having means for pressing the upper in the angle of union of the shoe inner sole and channeling lip thereof, combined with fastener inserting mechanism for securing the upper to the inner sole, said mechanism operating to insert the fastenings through the overturned upper in said angle of union and obliquely toward the middle of the shoe, each of the inserted fastenings being independent of others, substantially as described."

The experimental machine before 1899 and the commercial machine as adopted after that time embody improvements defined in the claims of patent No. 584,741, June 15, 1897, Ladd. Claim 13 is as follows: —

"13. A lasting machine of the character indicated, having in combination, a work presser having at its work bearing end an angular or corner formation for bending the overturned upper inwardly to the angle of junction between the inner sole and vertical edge face of the welt lip thereof, substantially as described."

Several of these experimental hand method lasting machines were, as I have stated, being tried out in shoe factories before February, 1899, but they were not acceptable to shoe manufacturers and could not compete successfully with the lasting machine of the bed type, which was probably chiefly due to the fact that at about that time, in 1898, it became the general practice in lasting welt shoes on bed lasting machines to secure the toe portion of the upper in lasted position by a wire which was secured to a tack on one side of the toe, carried around the toe in such location as to hold the lasted upper in position in the angle of union between the feather edge and the channel lip, and secured to a tack on the opposite side of the toe. The upper, at the toe, is held in lasted position by such a wire in Defendants' Exhibit 146, showing a woman's welt shoe lasted on the present hand method lasting machine for welt work.

The use for such a wire was a substantial improvement in methods of lasting welt shoes because it did away with the driving of a large number of tacks around the toe, which was very objectionable, particularly in lasting shoes on the narrow-toed lasts, which were much in vogue at that time, as I have explained in my previous testimony. Such lasts are shown in Defendants' Exhibits Nos. 133 and 134.

The experimental hand method lasting machine for welt work

prior to February, 1899, not only was not provided with any mechanism for putting the wire around the toe, but its organization would not permit the use of such a wire. The only way that the hand method machine could last narrow-toed shoes then in use was by driving an excessive number of tacks around the toe, which alone was enough to condemn the machine for satisfactory commercial use.

Immediately after the organization of the United Shoe Machinery Company experimental work was undertaken with a view to produce an organization which would enable the hand method lasting machine to secure the uppers of welt shoes around the toe by means of wire. The organization first commercially used, and which was adopted in 1900, is shown in patent No. 696,740, April 1, 1902, Ladd, and is defined in eleven of the claims of that patent. Typical claims of this patent are the first and eighth: —

"1. A machine for working an upper over a last, comprising mechanism for presenting individual fastenings, mechanism for supplying continuous fastening material, and means for rendering either of said mechanisms operative or inoperative."

"8. A machine for working an upper over a last, comprising means for inserting fastenings, means to suspend the insertion of said fastenings during a number of repeated operations of said machine and means for placing wire or a similarly continuous material in position for holding the parts of said upper which are manipulated by operations of said machine taking place during said suspension of the insertion of said fastenings."

This organization is also defined in all of the seven claims of patent No. 696,717, April 1, 1902, Cavanagh. The caims of this patent define in broad terms an organization of a hand method lasting machine adapting it for using wire in lasting toes of welt shoes. A typical claim is the first: —

"A machine comprising grippers and means for actuating them to work an upper over a last, combined with means for superimposing wire or a similarly continuous material on said upper overworked by said grippers to secure the upper on the last."

The commercial success of the hand method lasting machine for welt work dates from the incorporation in it, in 1900, of the wire-

applying organization defined in the claims of the two patents last discussed.

While the organization shown in its commercial form in patent No. 696,740, April 1, 1902, did satisfactory work so far as concerned the getting of the wire into the proper position on the shoe, it was so constructed and operated that it interfered with the operation of the machine because it occasionally prevented proper positioning of the shoe at certain times in the progress of the work. It was also inconvenient for the operator to use because it required him to operate a second treadle in addition to the starting and stopping treadle upon which he had to rest one foot throughout the operation of the machine. In 1901 an improved wiring organization was adopted and superseded that shown in the Ladd patent 696,740. This new organization was constructed and operated substantially as shown in patent No. 946,620, January 18, 1910, Stiggins (application filed March 21, 1901), and in patent No. 1,027,510, May 28, 1912, Stiggins (original application filed March 21, 1901). This new organization also embodied improvements set forth in patent No. 944,116, December 21, 1909, Wade (application filed November 8, 1900), which patent shows in its drawings an experimental stage in the development of the new wire-applying organization.

Typical of the claims of this patent No. 944,116, setting forth improvements embodied in the commercial organization, are one and eight, as follows: —

"1. A machine for working an upper over a last, comprising overworking mechanism, and mechanism for superimposing wire or like continuous material and in position for binding the overworked upper, said machine having provision for advancing the wire at each operation of the overworking mechanism."

"8. A machine for working an upper over a last, comprising mechanism movable toward and from operative position for superimposing wire or like continuous material in position for binding the overworked upper, means to put said mechanism into operative position, and means to take up the wire automatically when said mechanism is in inoperative position."

The improvement set forth in the claims of which the first above quoted is typical was incorporated in the improved organization

shown in patent No. 946,620 and was used until that mechanism was again reorganized in 1906, as I shall shortly explain. The improvement set forth in the claims of patent No. 944,116, of which claim No. 8 is typical, was embodied in the reorganized wire-applying mechanism which was adopted in 1906.

The defect in the earlier organization of the wire-applying mechanism, which required the operator to use two treadles during the operation of the machine, was overcome by improvements defined in many of the claims of patent No. 946,620, January 18, 1910, Stiggins, of which a typical claim is the third: —

"3. In a machine for working an upper over a last, means for superimposing wire or like continuous material in position for binding the overworked upper, mechanism for retarding the advance movement of said wire, mechanism for starting and stopping the machine, and connections wherethrough said retarding mechanism may be controlled by the starting and stopping mechanism."

The objection to the earlier wire-applying organization, that it was in the way of the shoe during the last operation, was overcome in the organization, Stiggins patent No. 946,620, by the improvement defined in many claims of that patent, of which claim 16 is typical: —

"16. In a machine for working an upper over a last, means for superimposing wire or like continuous material in position for binding the overworked upper, said means including a wire supporting guide, and means for automatically shifting the position of said guide relatively to the plane of the shoe bottom when the wire placing mechanism is rendered inoperative."

The severing of the wire at the end of the operation upon each shoe was conveniently provided for in this organization by mechanism shown in patent 1,027,510, May 28, 1912, Stiggins (application originally filed March 21, 1901).

The wire-applying organization of the machine was again improved in 1906 by the organization defined in the claims of patent No. 1,005,929, October 17, 1911, Bond (application filed February 25, 1907). This new organization embodies all the best features which had been used in the prior constructions, and included

improvements contributing to the successful and convenient use of the machine in lasting the toe. That patent shows the wire-applying organization as now embodied in the hand method lasting machine for welt work.

In the foregoing review of the development of the hand method lasting machine for welt work, particular attention has been devoted to explaining the improvement which adapted the machine for welt work, and which distinguished the machine from the hand method lasting machine for McKay work. It should be understood, however, that many of the mechanisms which are embodied in the hand method lasting machine for McKay work, and which I explained in connection with that machine, are embodied in the machine as adapted for welt work.

The hand method lasting machine for welt work is put out by the United Shoe Machinery Company through its lasting department and as now organized embodies the mechanisms set forth in the claims of the following patents: —

No. 584,741, June 15, 1897, Ladd.

No. 584,744, June 15, 1897, Ladd and McFeely.

No. 597,321, January 11, 1898, Ladd.

No. 696,717, April 1, 1902, Cavanagh.

No. 696,740, April 1, 1902, Ladd.

No. 944,116, December 21, 1909, Wade.

No. 946,620, January 18, 1910, Stiggins.

No. 1,005,234, October 10, 1911, Ladd and Stiggins.

No. 1,005,929, October 17, 1911, Bond.

No. 1,027,510, May 28, 1912, Stiggins (original application filed March 21, 1901).

Up to March 1st, 1913, the end of the company's last fiscal year, 2,750 Consolidated hand method lasting machines for welt work were put out. There is a difference of opinion among shoe manufacturers as to the desirability of using the hand method machine or the bed type of lasting machine for welt shoes. Those manufacturers who believe that they can secure better lasting upon the bed type of lasting machine prefer, and are supplied with, lasting machine No. 5, U. S. M. C., the United Company's standard com-

mercial bed lasting machine, which was introduced in 1908. Other manufacturers who are satisfied with the quality of the work done on the hand method lasting machine for welt work prefer that machine because they can get twice the amount of work from it as from the bed type of lasting machine. Either type is supplied to the manufacturer by the United Company, according to his preference.

Hand Method Lasting Machines for Turn Shoes.

In February, 1899, there was no commercial lasting machine which was adapted for successful work in lasting either the toes or the heels of turn shoes. Neither the hand method lasting machine for welt work, nor the hand method lasting machine for McKay work was adapted for use in lasting turn shoes. The machine for McKay work was not adapted for that use, for reasons which were similar to the reasons which I have pointed out why that machine was not adapted for the lasting of welt shoes, and for other reasons due to the peculiar problems attending the lasting of turn shoes. The McKay machine may be disregarded in the discussion of the adaptability of the hand method type of lasting machine for the lasting of turn shoes.

As for the reasons why the hand method machine for welt work was not adapted for the lasting of turn shoes, perhaps the most important reason is that in lasting the forepart of a turn shoe by machine it is not practicable to use tacks. A turn shoe is unique in that it has but one sole. A turn sole is shown in Defendants' Exhibit 118. A turn shoe is lasted wrong side out, and during the lasting operation the grain side of the sole which is to form the tread face of the sole in the finished shoe is against the bottom of the last. In the lasting operation tacks must not be driven clear through the sole, as in that case they would pass through the grain face of the sole and when they were withdrawn would leave holes in the bottom of the sole. Attempts were made to use the hand method lasting machine for welt work with an organization which would not drive the tacks clear though the sole, but this proved to be impracticable, as the mechanism of the machine could not be

depended on to operate in this way and frequently drove a tack clear through the sole, and so defaced the grain inside.

Another explanation of the failure of the hand method lasting machine for welt work in lasting turn shoes was the lack, in that machine, of means for properly taking care of the feather edge of the turn sole during the lasting operation. In a welt shoe the feather edge of the insole is concealed in the finished shoe, but in a turn shoe the feather edge of the sole, that is, the extreme edge portion between the edge of the sole and the channel rib, is exposed in the finished shoe, and it is therefore important that that edge shall not be defaced or injured in the lasting operation. During the lasting operation this feather edge lies against the last at the extreme edge of the last, and, in fact, as turn shoes are usually made, it extends somewhat over the edge of the last. Accordingly, there is a constant tendency in the operation of the lasting machine to turn up the feather edge during the straining of the upper up over the edge of the last. This tendency to curl up the edge of the sole is aggravated by the fact that during the lasting operation the sole must be "in temper", that is, must be so thoroughly dampened by water that after the lasting operation, and after the last has been removed from the shoe, it can be turned right side out without danger of breaking the sole.

The hand method lasting machine was not, in February, 1899, organized so that it could last a turn shoe without constant danger of curling up the edge of the sole. This was fatal to its success on that work, as the needle of the turn sewing machine, the operation of which follows the lasting while the shoe is still wrong side out, and with the feather edge still inside of the shoe, would frequently strike the upturned edge of the sole and would mutilate it and sometimes spoil it, so that all the work on the shoe up to that time had to be undone and a new sole substituted.

LASTING MACHINE: CONSOLIDATED HAND METHOD (TURN TOE).

The first machine designed and adapted particularly for lasting the toes of turned shoes was produced and supplied to shoe manufacturers by the United Company in 1906. This machine was con-

structed substantially as shown in the drawings and as set forth in the claims of patent No. 1,009,054, November 21, 1911, DeMinico, granted on an application originally filed December 12, 1906, with the incorporation in the organization shown in that patent No. 1,009,054 of the mechanism illustrated in the drawings and set forth in the claims of patent No. 784,251, March 7, 1905, DeMinico.

In this machine no tacking mechanism whatever was employed, as the machine was organized to secure the upper in lasted position around the toe by means of wire, the wire-attaching organization being substantially the same as that employed on the hand method lasting machine for welt work, with an improvement which adapted that organization for the peculiar conditions of turn work.

The necessity of this change was that owing to the fact, as I have explained, it is not permissible to drive tacks clear through the turn sole, the tacks to which the upper-holding wire is secured do not hold the wire which secures the upper in lasted position with sufficient strength to permit of the use of the wire-severing mechanism of the welt machine organization, and after that wire-severing means had been tried on a few of the turn toe-lasting machines it was discarded as impracticable and there was substituted for it a wire-cutting mechanism which is operated by a limited movement of the starting and stopping treadle of the machine, which movement is not sufficient to start the machine. This arrangement, which was very convenient for the operator, is defined in many claims of patent No. 1,009,054, November 21, 1911, DeMinico, of which claim 14 is typical: —

"14. In a machine of the class described, a starting and stopping mechanism, a treadle, a connection between the said mechanism and the treadle, a cutting device, and a connection between the treadle and the cutting device, said parts being constructed and arranged to permit the treadle to be actuated for operating the cutting device without operating the starting and stopping mechanism."

Many turn shoes are made with plain toes, that is, without any tip, the tip being the small portion of upper stock which commonly forms the toe end of the upper in shoes as usually made.

Furthermore, these plain-toed turn shoes are also often made without toe boxes, the toe box being the stiff material usually

interposed between the lining and upper of a welt shoe to give permanent shape to the toe portion of the upper while it is being worn. In lasting this plain-toed shoe the stock would not stand as much pulling strain by the grippers as is ordinarily required in the operation of the machine. To adapt a turn toe-lasting machine to this class of work it was so organized that the operator could instantly adjust the machine to provide for a shorter pulling stroke. This mechanism was defined in many claims of patent No. 1,009,054, November 21, 1911, DeMinico, of which claim No. 1 is typical: —

"1. In a machine for working an upper over a last, the combination with grippers to seize and pull the upper and means for actuating them automatically to draw the upper inwardly over the edge of the last for laying it in position to be fastened, of means adapted to be adjusted for varying the position to which said actuating means can move the grippers inwardly over the last bottom."

In the same class of work it is also frequently necessary, in addition to shortening the pulling movement of the grippers, to lighten the strain exerted by them in the combined sidewise and turning movement which they have in plaiting or folding the upper in lasting around the toe. This was provided for in the turn toe-lasting machine by providing means arranged for convenient manipulation by the operator for quickly varying this plaiting tension.

This improvement is also set forth in numerous claims of patent No. 1,009,054, of which a typical claim is the twenty-fourth.

"24. In a machine for working an upper over a last, the combination with grippers, of mechanism to actuate the grippers to plait the upper while lasting around the toe portion of the shoe, including a spring and means, arranged in position to be manipulated by the operator standing in working relation to the machine, by which the plaiting tension may be increased and diminished as the plaiting progresses."

The problem of preventing the turning up of the extreme edge, that is, the "feather edge" of the sole, which was one of the most serious problems to be dealt with in organizing the hand method lasting machine for turn work, was solved by the mechanism illustrated in the drawings and set forth in the claims of patent No. 784,251, March 7, 1905, DeMinico.

No hand method lasting machine has been successfully used in

the lasting of the foreparts of turn shoes which was not provided with this improvement defined in the ten claims of this patent. The nature of the improvement is well indicated by claims 1 and 14, which are as follows: —

"1. In a lasting machine, the combination with means for working an upper over a last, of a downhold having a portion shaped to overlie the shoulder or rib of the sole of a shoe being lasted and a portion formed to bear upon the marginal portion of the sole outside said shoulder or rib and at one side of the said upper working means."

"14. In a machine for lasting shoes, the combination with means for working an upper over a last, and a rest for engaging the sole to position the shoe, of a yielding downhold mounted on the rest and extending beyond the latter for engaging the feather edge of the sole to prevent displacement of the edge of the sole during the lasting operation."

It has been attempted in the foregoing discussion of the hand method lasting machine for turn toes to refer in detail only to the improvements which adapted the hand method machine particularly for this work. It should be understood, however, that most of the features of the organization of the hand method lasting machine for welt work are also embodied in the machine when organized for lasting toes of turn shoes. On January 1, 1913, the standard commercial hand method lasting machine for lasting turn toes, put out by the United Company, embodied the mechanisms defined in the claims of the following patents: —

No. 584,741, June 15, 1897, Ladd.

No. 584,744, June 15, 1897, Ladd and McFeely.

No. 696,717, April 1, 1902, Cavanagh.

No. 696,740, April 1, 1902, Ladd.

No. 784,251, March 7, 1905, DeMinico.

No. 893,331, July 14, 1908, Ladd.

No. 946,620, January 18, 1910, Stiggins.

No. 1,005,234, October 10, 1911, Ladd and Stiggins.

No. 1,009,054, November 21, 1911, DeMinico.

I produce a lasted turn shoe, the toe of which was lasted on this new turn toe lasting machine, the official name of which is "Lasting Machine, Consolidated Hand Method Turn Toe".

[*Lasted turn shoe having toe lasted on hand method turn toe lasting machine is introduced in evidence, and marked "Defendants' Exhibit 147".*]

[*Answer to Int. 78 continued:*]

This machine is put out by the United Shoe Machinery Company through its lasting department.

LASTING MACHINE: CONSOLIDATED HAND METHOD (TURN HEEL SEAT).

Until 1906 the hand method lasting machine had not been adapted for lasting the heel ends of turn shoes. Turn shoes are made in two ways as regards the attachment of the heel end of the toe and the upper. Some turn shoes have the upper secured to the sole on the turn sewing machine all the way around the sole, including the heel seat, the heel seat being the heel end of the sole to which the heel is subsequently to be attached. Other turn shoes have the sole attached on the turn sewing machine only in the shank and in the forepart, leaving the heel seat of the sole unattached, to be secured subsequently in the operation known as "heel seat nailing". This class of turn shoes is illustrated in Defendants' Exhibit 147, in which the channeling on the sole indicates that the operation of the turn sewing machine is to stop at the heel seat. Such a shoe is also shown in the turn shoe which I now produce, which has had the upper secured to the sole on the turn sewing machine, and has been turned right side out.

[*Turn shoe having its heel seat lasted by lasting machine "turn heel seat" is introduced in evidence, and marked "Defendants' Exhibit 148".*]

[*Ans. to Int. 78 continued:*]

In the lasting of shoes which have their soles sewed in the shank and forepart, but not around the heel seat, it is the practice, after the shoe has been turned to insert a last on which the subsequent operations are to be performed, to place a "heel-seat piece" on the heel end of the last to form an anchor for the lasting tacks and then to last the upper over this heel-seat piece and secure the upper to it by means of tacks. The problem in doing this work by machine

was to organize a machine which could operate properly in the angle between the loose end of the sole and the upper. On inspecting Defendants' Exhibit 148, the difficulty of lasting in the portion of the upper adjacent to the seam and of tacking it in lasted position will be clear. Attempts had been made to use the hand method lasting machine, welt, in this operation of lasting heel seats of turn shoes, but it was not commercially successful for that work because it was not organized to operate in the small space between the sole and upper adjacent to the end of the seam. Accordingly a reorganized hand method lasting machine was produced for this special work and was first put out for commercial use in April, 1906. The machine did not reach its present commercial form until 1907, when the combined wiper and tack-locating means shown in the drawings and defined in the claims of patent No. 1,003,984, September 26, 1911, Clary (application filed December 13, 1907), was adopted. The mechanism of that Clary patent made this machine commercially successful. The organization is defined in all ten claims of that patent, typical claims of which are 1 and 2 :—

"1. In a machine of the class described, a horizontally moveable tack block having at its forward end a transverse driver passage towards which said block is tapered, the forward end of said tack block being rounded in two dimensions, and a yielding tack retaining pocket in line with said driver passage.

"2. In a machine of the class described, fastening, retaining and guiding means comprising a horizontal support provided at its forward end with a transverse driver passage towards which said support is tapered, the forward end of said support being rounded in two dimensions and a pair of spring fingers extending lengthwise of said support, said fingers being rigidly attached to the sides of said support at their ends remote from said passage, and being bent towards each other and shaped at their other ends to form between them a nail pocket in line with said passage."

Another improvement contributed to the success of this machine for this special work and is defined in the claims of patent No. 718,586, January 13, 1903, Stiggins. The utility of this invention in this organization is due to conditions peculiar to turn shoes, which must be provided for in lasting their heel seats. Owing to the fact that the counter must be introduced into the shoe while it

is turned wrong side out, as will be noted in Defendants' Exhibit 147, it is impossible to use in such shoes what is known as a "molded" counter, that is, a counter which, before it is assembled in the shoe, is molded to approximately the shape which it is to have in the finished shoe, and in particular has formed upon it in the molding operation a flange which, when the counter is placed in the shoe, rests upon the face of the insole of a welt or McKay shoe around the heel end of the shoe. The reason why a molded counter cannot be used in a turn shoe is because when, after the lasting operation, the shoe is turned right side out, the counter must be turned too, and in that turning operation every curve in the counter must be reversed. It would be impracticable, therefore, to use a molded counter since the flange on the counter would have to be reversed, which would be impracticable and difficult, and also the utility of the molded counter after it had been turned would be impaired.

Accordingly, in the manufacture of turn shoes, a "straight" counter is always used, that is, a flat piece of leather of the dimensions required, which is bent to fit the heel end of the last when it is introduced into the shoe. To facilitate the turning of the shoe this counter must be "in temper", that is, it must be thoroughly dampened so that during the turning operation the shape of the counter may be readily reversed without damaging it. In practically all McKay sewed shoes and in the majority of welt shoes it is the practice to use molded counters which, during the lasting operation, are dry. The proper shaping of the counter around the heel end of the shoe, at the ends of the counter at the beginning of the shank, presents problems peculiar to turn shoes. These problems were met by providing the organization of the turn heel lasting machine with the edge gauge which is shown in patent No. 718,586, January 13, 1903, Stiggins. This edge gauge was so constructed that it would engage the counter positively and firmly adjacent to the tread face of the last while it was self-adaptable to the varying inclinations of the side of the last around the rear end and sides of the heel and at the beginning of the shank. Claims 4 and 5 of this patent No. 718,586 are as follows: —

"4. An edge gage comprising a support, a segment piece, movable on said support in the arc of a circle and a contact piece mounted on said segment piece and having the center of said arc located in its contact surface.

"5. An edge gage comprising a support having a rib and segment piece having a groove to fit on said rib, a contact piece on said segment piece, and the spring tending to maintain said contact piece in normal position."

The organization of these claims enables the edge gauge to press positively and firmly against the stock requiring the most force to shape it properly to the last and yielding against that portion which requires less pressure.

In addition to the patents which I have mentioned which adapt the organization of this machine to the peculiar conditions met in the lasting of turn heel seats, the machine embodies mechanisms set forth in other patents which have been described in connection with other models of the hand method lasting machine. The patents defining in their claims the mechanism embodied in this machine at the present time are as follows: —

No. 584,743, June 15, 1897, Ladd.

No. 597,321, January 11, 1898, Ladd.

No. 718,586, January 13, 1903, Stiggins.

No. 1,003,984, September 26, 1911, Clary.

No. 1,014,940, January 16, 1912, Bond (original application filed February 25, 1907).

This machine is put out by the United Shoe Machinery Company through its lasting department.

LASTING MACHINE: CONSOLIDATED HAND METHOD (WELT SIDE).

For a number of years after the formation of the United Shoe Machinery Company in 1899, it was the general practice for shoe manufacturers who use lasting machines of the bed type for welt shoes to last toes and heels of the shoes on the bed lasting machine and to last the sides, that is, the shanks and foreparts, by hand; and this practice continued for a number of years after the formation of the United Shoe Machinery Company in those factories where the bed type of lasting machine was used.

In those factories, however, where the welt shoes were lasted on the hand method lasting machine the shoes were lasted all around by machine so that no hand operation was necessary. The machine known as the "Lasting Machine, Consolidated Hand Method (Welt Side)" was developed in order that the company might be able to supply to those manufacturers who were using the No. 5 lasting machine, the standard bed lasting machine of the United Company since January, 1908, a machine for use in lasting the sides of the shoe in foreparts and shanks, so that users of the No. 5 lasting machine might, like users of the hand method lasting machine on welt work, last their shoes all around by machine. It was not practicable to use regular hand method lasting machines for lasting sides of shoes because that machine is a highly organized machine provided with elaborate mechanisms intended particularly for use in lasting the toe, the most difficult part of the lasting operations, which mechanisms not only were not needed for the much simpler operation of lasting the sides of the shoe, but would actually be in the way of the operator. Accordingly there was produced and put into commercial use in September, 1908, a machine especially built for lasting the sides of welt shoes. Improvements embodied in this machine are defined in claims of those patents which have already been discussed in connection with the welt hand method lasting machine, so that it will be unnecessary to do more here than enumerate the patents, which are: —

No. 184,744, June 15, 1897, Ladd.

No. 597,321, January 11, 1898, Ladd.

No. 893,331, July 14, 1908, Ladd.

No. 1,005,234, October 10, 1911, Ladd and Stiggins.

This machine is supplied entirely free, without any charge whatever either by way or royalty or by way of initial payment, to shoe manufacturers using the No. 5 lasting machine and the pulling-over machine. The machine is put out by the United Company through its lasting department.

I produce a shoe, the sides and forepart of which were lasted on this hand method welt-side lasting machine. The toe and heel of this shoe were lasted on the No. 5 lasting machine.

[*Shoe illustrating operation of hand method welt-side lasting machine in shanks and forepart, and No. 5 lasting machine at toe and heel, is introduced in evidence and marked "Defendants' Exhibit 149".*]

Int. 79. Have you collected under one or more separate covers the patents relating to lasting machines with regard to which you have testified?

Ans. Yes, sir; and I produce five volumes of patents, the first comprising the patents mentioned in the portion of my testimony relating to the Chase lasting machine.

[*Volume of patents relating to Chase lasting machine is introduced in evidence, and marked "Defendants' Exhibit 150".*]

[*Answer to Int. 79 continued:*]

The second volume comprises patents mentioned in the portion of my testimony relating to lasting machine No. 5, U. S. M. C.

[*Volume of patents relating to lasting machine No. 5, U. S. M. C., is offered in evidence, and marked "Defendants' Exhibit 151".*]

[*Answer to Int. 79 continued:*]

The third volume comprises the patents mentioned in the portion of my testimony relating to the Ideal lasting machine.

[*Volume of patents relating to Ideal lasting machine is introduced in evidence, and marked "Defendants' Exhibit 152".*]

[*Ans. to Int. 79 continued:*]

The fourth volume comprises the patents mentioned in the portion of my testimony relating to the McKay & Copeland lasting machine.

[*Volume of patents relating to the McKay & Copeland lasting machine is offered in evidence, and marked "Defendants' Exhibit 153".*]

[*Ans. to Int. 79 continued:*]

The fifth volume comprises all of the patents mentioned in the portion of my testimony dealing with all five of the models of the hand method lasting machine. These models are: —

"Lasting Machine, Consolidated Hand Method (McKay)".

"Lasting Machine, Consolidated Hand Method (Welt)".

"Lasting Machine, Consolidated Hand Method (Turn Toe)".

"Lasting Machine, Consolidated Hand Method (Turn Heel Seat)".

"Lasting Machine, Consolidated Hand Method (Welt Side)".

[*Volume of patents dealing with five models of hand method lasting machine is introduced in evidence, and marked "Defendants' Exhibit 154".*]

Int. 80. Please give the number, date and name of the patentee of the several patents contained in the several volumes just offered in evidence as Defendants' Exhibits Nos. 150, 151, 152, 153 and 154.

BOSTON, MASS., October 14, 1913.

MACHINES RELATING TO THE MANUFACTURE AND ATTACHING OF HEELS.

Int. 80. In the list of machines submitted by you in answer to interrogatory 7, you refer to machines relating to the manufacture and attaching of heels. State as briefly as possible what were the more important of the machines for these purposes that were standard with the United Company in 1899, and their place in the manufacture of shoes. If the same were the subjects-matter of Letters Patent of the United Company, name the patents. State also the extent and character of the development of this machinery since 1899, what improvements and modifications have been made, if any, and if such improvements and modifications have been the subjects-matter of Letters Patent of the United Company, name the patents.

Ans. The heel-attaching operation comprises, generally speaking, the securing of the heel and the toplift to the shoe by the driving of nails through the heel, out-sole and insole and clinching them on the itside of the shoe by turning the points back into the insole. This work is done in two ways. When the heel is "surface nailed" the nails are driven through the toplift and heel at one operation. When the heel is "blind nailed" the heel proper is attached by driving nails through the heel, out-sole and insole and clinching them as I have described, leaving the head ends of the nails projecting above the outer face of the heel a distance slightly less than the thickness of the toplift, and then "spanking" the toplift upon those projecting head ends of the nails. Only the heels of the cheaper grades of shoes are "surface

nailed", and the heels of all the better and higher grades of shoes are always "blind nailed", as "blind nailed" heels present a much more attractive appearance. Heel-attaching machines of the present day are highly organized machines, comprising elaborate mechanism for presenting in proper relation for the heel-attaching operation the shoe, heel, toplift and nails. I will not undertake at this time to enumerate these mechanisms or to state their respective functions.

Heels are prepared for the heel-attaching operation in the following manner: The first step is "building" the heel. In this operation the heel "lifts" comprising pieces of leather, died out to the required shape, are placed one upon another until the heel blank is of the required height and then the lifts are usually secured together by driving one or two nails through the lifts. These heel lifts, however, are often warped, owing to the fact that the portions of the hide from which they are cut are warped, and even if the lifts were always flat they would not fit tightly enough together, so that if attached to the shoe in this condition there would be substantial cracks between adjacent lifts. Furthermore, the "heel-seat face" of the heel is not of the proper shape to fit the more or less convex heel-seat end of the sole. Accordingly, before the heel-attaching operation, it is the practice to compress heels, the object of this operation being to force the lifts closely together and simultaneously to shape the "heel-seat face" of the heel so that it will fit approximately the heel seat of the sole. This operation is performed by putting the heels through a heel-compressing machine which subjects a heel to great pressure, usually at least fifty or sixty tons.

Heel Compressing Machines.

A heel-compressing machine of the present commercial type comprises, generally speaking, side dies for shaping the sides and curved rear end of the heel, a breast die for engaging and shaping the breast face, that is, the front face of the heel, and relatively movable dies for engaging and shaping the tread face and heel-seat face. These dies are operated to impart great pressure to the heel

in the operation of the heel-compressing machine, which is very heavy and powerful. After the heel-compressing operation the heel lifts are forced closer together so that the heel is practically one solid piece of leather, and the heel-seat face of the heel is given the desired concave shape to correspond with the shape of the heel end of the sole.

The first commercial heel-compressing machine is shown in patent No. 105,030, July 5, 1870, Bigelow. This machine was commercially used for many years. A typical claim of this Bigelow patent is the first: —

"1. The combination of the follower F with the die E, substantially as and for the purposes set forth."

The "follower F" of this claim is the die for engaging the heel-seat face of the heel. This die is known in the trade as a "follower".

Just prior to February, 1899, the McKay Shoe Machinery Company was putting out two types of heel-compressing machines. One of these, known as the "Fisher Compressing Machine", was constructed substantially as shown in patent No. 350,051, September 28, 1886, Glidden. This machine was adapted for use in connection with the heel-attaching machine known as the "McKay Rapid Nailer". That machine required that the heel to be attached by it should be "loaded" before the heel-attaching operation. A loaded heel is a heel which has been compressed and into which the nails have been partially inserted, to be fully driven later by the heel-attaching machine. The Fisher compressing machine, in addition to compressing the heel, formed holes extending part way through the heel into which nails were stuck by boys, and the heels were then ready for the operation of the McKay rapid nailer.

About 1893 the inventors of the McKay & Bigelow Heeling Machine Association, predecessor in business of the McKay Shoe Machinery Company, which was putting out the Fisher compressing machine, produced a machine which was a substantial advance in the industry in that it not only compressed the heels and formed holes for the reception of the nails, like the Fisher compressing machine, but it also inserted the attaching nails in those holes, thus

producing automatically a compressed and loaded heel. As I have explained, the Fisher compressing machine only formed the holes and the nails had to be inserted in the holes by hand. I produce a loaded heel which was compressed and loaded on this improved machine first put out about 1893 and known as the "Automatic Heel Compressing and Loading Machine".

[*Loaded heel produced by "Automatic Heel Compressing and Loading Machine" is offered in evidence, and marked "Defendants' Exhibit 155".*]

[*Answer to Int. 80 continued:*]

This machine was being put out by the McKay Shoe Machinery Company just prior to February, 1899, and was constructed substantially as shown in patent No. 543,804, July 30, 1895, Glidden and Small. The machine embodied mechanisms set forth in all twelve of the claims of that patent. The machine was organized to take nails from bulk in a hopper and to present in position for the nail-inserting operation the desired number of nails properly arranged to be inserted at each operation of the machine. The nail-arranging mechanism was constructed substantially as shown in patent No. 577,212, February 16, 1897, Small, and six of the seven claims of that patent define mechanism embodied in the nail-handling organization of that machine. That mechanism was also defined more broadly in the claims of patent No. 577,212, February 16, 1897, Small.

This later machine, the Automatic compressing and loading machine, was, like the Fisher compressing machine, a companion machine for the McKay rapid nailer. As I have stated, the McKay rapid nailer required that the heel which was to be attached should have been loaded previously to the operation of that machine. This McKay rapid nailer was, however, superseded in 1898 by the machine then known as the "Improved Rapid Nailer", which was organized to take from a mass of nails the required number of nails for each heel, automatically arrange those nails with their points all extending in the same direction, present them in proper position for the operation of the drivers, and then to drive the nails automatically and thereby attach the heel to the shoe.

Obviously, in the operation of this improved rapid nailer, it was no longer necessary that the heels should be loaded before the heel-attaching operation. On the other hand, trade conditions required then, that is, about 1898, as they always have since, that heels be compressed before they are attached to shoes. The Fisher compressing machine was already out of date, and competitors were offering to the trade a greatly improved heel-compressing machine. Under these conditions the McKay Shoe Machinery Company was obliged to supply for the operation of compressing heels, either the out-of-date Fisher compressing machine with the pricking awls stripped from it, or the elaborate Automatic compressing and loading machine stripped of its nail-arranging organization, awls and nail drivers.

In other words, the McKay Shoe Machinery Company, just prior to February, 1899, did not have a satisfactory heel-compressing machine.

Compressing Machine: Model 4, Automatic Heel.

Immediately after the formation of the United Shoe Machinery Company in February, 1899, it undertook the development of a satisfactory modern heel-compressing machine, and eventually produced the machine which has since been known as the "Compressing Machine No. 4, Automatic Heel", which was first put out for commercial use in September, 1900. The machine as first put out was constructed substantially as shown in patent No. 776,787, December 6, 1904, Leland (application filed August 29, 1902). One of the chief objects which the inventors had in mind in developing this machine was to produce a machine which would handle the heel throughout its operation in such manner as not to deface or injure the heel in any way. In both the Fisher compressing machine and the Automatic compressing and loading machine, the heel had been removed from the mold by means of awls in the heel-seat die which were forced into the heel during the compressing operation and removed it from the mold, in the Fisher machine holding it in the path of the heel-ejecting mechanisms, there being two such awls in the Fisher machine and three in the Automatic

compressing and loading machine. This arrangement was objectionable because awls defaced the heel and because they often failed to operate properly so that the heels were occasionally spoiled, and occasionally also the machinery was broken. In the operation of the Fisher compressor sometimes awls would get an unusually strong grip on the heels and, when the ejecting mechanism operated to knock the heels off the awls, sometimes the two or three lifts which were held by the awls would remain in the machine, the rest of the heel being knocked off from those lifts. This spoiled that heel, and also the next one which was operated upon, and frequently caused breakage of the machine. The machine of the Leland patent No. 776,787, December 6, 1904, was provided with an entirely new organization for getting the heel into the mold, and discharging it from the mold after the compressing operation. The machine was so organized that when, after the compressing operation, the mold was opened by moving the side and breast dies away from the heel, the bottom plate of the mold was raised to the same plane as the top surfaces of the side molds, thus presenting a substantially continuous plane face on which the heel rested in position to be ejected. The heel was then pushed off from that plate by a combined heel-ejecting and heel-feeding mechanism, which, immediately after knocking off the compressed heel, deposited a new uncompressed blank on the bottom plate, still in its raised position. The moment this bottom plate had received the new uncompressed blank it dropped back into normal position at the bottom of the mold, ready for a repetition of the compressing operation. In this manner the heel was handled by the machine in such manner that nothing was done to it at all except the application of the great pressure, which was, of course, the object of the operation.

The development of an organization by which the heel could be handled in the manner I have just indicated, presented problems which may be very briefly indicated as follows: It is important that the heel be deposited in the mold when the mold is open to substantially the fullest extent, in order that accidental engagement of the heel with the side or breast dies, consequent misplac-

ing of the heel, and possible breakage of the machine, may be avoided. On the other hand, as much time as possible must be afforded for the ejecting of the compressed heel and the feeding and depositing in the mold of the uncompressed blank. These problems were effectively solved in the operation of this new "No. 4 Heel Compressing Machine". A typical claim of patent No. 776,787, directed to this organization, is the forty-second, which is as follows:—

"42. A compressing machine, comprising a mold and a co-operating die, means for relatively moving said mold and die, and an independently movable plate normally forming the bottom of the mold, combined with means for moving said plate to cause a compressed heel to be discharged from the mold during the first portion of the movement of the mold away from the die, and for causing said plate to return to normal position during the first portion of the movement of the mold toward the die."

The operation of this organization was greatly facilitated by a combined heel feeding and ejecting mechanism which presented a new uncompressed blank for the operation of the machine immediately upon the ejection of the previously compressed blank. A typical claim of patent No. 776,787 directed to this organization is the fifth:—

"5. In a heel compressing machine, feeding and ejecting means comprising arms having clamping portions for holding the heel blank to be fed and abutments for engaging the heel to be ejected."

The proper introduction and removal of heels from this machine was further facilitated by mechanism which operated to keep the molds open to their widest extent during as long a period as practicable during each cycle of the machine's operations. This mechanism is defined in a number of claims of the Leland patent No. 776,787, of which a typical claim is the third:—

"3. In a heel compressing machine, means for compressing a heel, said means including a reciprocating head, a mold comprising movable members mounted on said head, actuating links therefor, each connected at one end to said members and having its other end connected to a fixed part of the machine, one of said connections permitting a limited amount of lost motion, and means for controlling the period when said lost motion may take place,

whereby the mold is open during the first portion of the descent of the reciprocating head, and remains open until the last portion of the rise of the head."

The desired co-operation of the side and the breast dies for opening and closing the mold was secured by the organization defined in a number of claims of this Leland patent No. 776,787, of which a typical claim is the twenty-fifth: —

"25. A heel compressing machine provided with a heel mold comprising side compressing dies and a breast plate connected together to permit a limited movement for closing and opening the mold, and means to move said members in the same plane, for the purpose described."

The machine of this Leland patent No. 776,787, December 6, 1904, embodying mechanisms defined in most of the forty-two claims of that patent, provided a far more satisfactory heel-compressing machine than either the old Fisher machine or the Automatic compressing and loading machine, and the occasional spoiling of heels and frequent breakage of parts which seriously interfered with the operation of those two older machines was obviated in this new No. 4 heel compressing machine.

During the first months of the commercial use of machines constructed as shown in Leland patent No. 776,787 it was found that the operation of the machine could be improved upon by embodying in it improvements shown in patent No. 776,823, December 6, 1904, Allen (application filed November 12, 1902). These improvements which were adopted in May, 1901, comprised, first, improved means for keeping the mold wide open as long as possible during each cycle of the machine's operation. A typical claim on this feature is the first: —

"1. In a heel compressing machine, means for compressing a heel, said means including a reciprocating head and a divided mold comprising movable members, means for closing the mold, a spring interposed between said members for separating them to open the mold, said closing means having provision for positively opening the mold in case the spring fails to act properly."

Secondly, improved mechanism for properly locating the heel in the blank-feeding mechanism was defined in a number of claims of this patent No. 776,823, of which No. 5 is typical: —

"5. In a heel compressing machine, heel blank feeding mechanism having a holder comprising an abutment for the breast of the heel, and arms provided with movably mounted spring actuated devices, arranged to engage the oppositely curved surfaces at the rear of the heel to force it toward the abutment, substantially as described."

Third, an important improvement over this first construction which is defined by a number of claims of this Allen patent No. 776,823 was directed to preventing the heel plate of the mold, known as "toplift plate" because it engages the toplift face of the heel, from jumping out of the mold at the end of its necessarily quick rising movement, to raise the compressed heel at the completion of the compressing operation. A typical claim directed to this improvement is the fourteenth: —

"14. In a machine of the class described, heel compressing dies, a top lift plate comprising part of one of said dies, means for giving said top lift plate an independent relative movement, and means movable into and out of operative position for limiting the extent of independent movement of said top lift plate."

At the same time that the Allen improvements were adopted there were also incorporated in the machine further improvements shown in the drawings and set forth in the claims of patent No. 776,875, December 6, 1904, Tripp (application filed February 24, 1903).

These improvements consisted in reorganizing the blank-feeding mechanism so that it could be instantly removed to permit access to the dies so that the dies could be readily changed. In adapting the machine for different sizes and for different styles of heels, it is frequently necessary to change most, and generally all, of the dies, and mechanism which permits this change to be made quickly adds, of course, to the convenience of the operator, and decreases the time that the machine is idle during the changing of the dies.

Another improvement defined in the claims of this Tripp patent No. 776,875 was directed to preventing breakage of parts of the blank-feeding mechanism in case there were an obstruction to its operation, as would be occasioned, for example, by a misplaced heel. The organization of this No. 4 heel compressing machine was again improved in 1909 by a still further improved means for

keeping the molds wide open as much of the time as possible during the cycle of the machine's operations. These improvements are shown in the drawings and defined in the claims of patent No. 1,012,007, December 19, 1911, Pope (application filed July 6, 1909). This improvement was a matter of considerable practical importance in saving the operator's time and reducing the time that the machine was idle, owing to the necessity of replacing parts.

Several other improvements contributing to the successful operation of this machine are not shown in any patents which have as yet been granted. I should add also that the machine is provided with a considerable number of improvements which adapt it for operating on special classes of work. These improvements are shown and set forth in the claims of a number of patents in addition to those which I have mentioned, and are so numerous that I will not undertake to enumerate them at this time. However, all these improvements are, of course, of importance as they enable a manufacturer to do any kind of work which may come to the machine in the regular course of a day's work.

Condensed Toplift.

A new use was found for this No. 4 heel compressing machine after the invention of the condensed toplift, which is shown and defined in the claims of patent No. 781,236, January 31, 1905, Small. A typical claim of this Small patent is the first: —

"1. As a new article manufacture, a top lift comprising a blank cut from a piece of leather and thereafter compressed and condensed by great pressure both upon its faces and its edges to such an extent that substantial changes are effected in its characteristics or qualities, substantially as described."

This invention, introduced commercially in 1903, completely revolutionized the making of toplifts. Uncompressed toplifts are frequently warped and have irregular edges, and great difficulty had been experienced, prior to the invention of the condensed toplift, in properly handling toplifts in the heel-attaching machine. The toplift-handling mechanism of such a machine engages the toplift at its edges, and when the toplift is warped or its edges are

irregular there is great danger that the toplift will spring out during the sudden, quick movement of the toplift-holding mechanism into attaching position, and great difficulty was experienced in the spoiling of toplifts, and frequently in breakage of the machine, owing to the dislodgement or misplacement of the toplift in this way.

Furthermore, a blank which had been cut for a toplift was frequently found to have blemishes or defacing marks upon its grain face, that is, the face which is to be exposed in the finished shoe, which would prevent its use as a toplift, although otherwise, as regards the quality of its leather and other requisites for a toplift blank, this blank was entirely suited for use as a toplift. It was discovered by one of the United Company's inventors that a warped toplift could be made perfectly flat, that the edges could be made uniform, and that blemishes in the grain face of the blank could be removed so that either a blank which before compressing operation would be unfit for use could be, after being compressed, satisfactorily used as a toplift, or a toplift blank suitable for a cheap grade of shoes could be so substantially improved as to adapt it for a higher grade of shoes.

The No. 4 heel compressing machine was, after the production of this improved toplift, organized for applying to it the amount of pressure required to produce the substantial and striking improvements which are afforded by applying to a toplift blank a very heavy pressure. As the condensed toplift is ordinarily made, it has applied to it in the compressing machine a pressure of about seventy-five tons. In the operation of the No. 4 compressing machine for the production of condensed toplifts there was practiced the method defined in patent No. 772,840, October 18, 1904, Small, of which a typical claim is the first: —

"1. The method of producing a top lift which consists in first reducing the diameter of a top lift blank by pressure on its edges, and then exerting great pressure on its faces, whereby the characteristics and qualities of the top lift are appreciably changed."

I produce a sample of an uncompressed toplift.

[*Sample of uncompressed toplift is introduced in evidence, and marked "Defendants' Exhibit 156".*]

[*Answer to Int. 80 continued:*]

I also produce a compressed toplift which was made from a blank cut out from a piece of sole leather right beside the uncompressed blank of Defendants' Exhibit 156.

[*Sample of compressed toplift is introduced in evidence, and marked "Defendants' Exhibit 157".*]

[*Answer to Int. 80 continued:*]

I further produce the piece of sole leather from which these two blanks were cut. The uncompressed and compressed blanks are numbered, respectively, 2 and 3, and the piece of sole leather is likewise numbered to indicate the openings from which the two toplifts were cut.

[*Piece of leather from which Exhibits 156 and 157 were cut is offered in evidence, and marked "Defendants' Exhibit 158".*]

[*Answer to Int. 80 continued:*]

By way of further illustration of the advantages of the condensed toplift, particularly in its enabling the use for toplifts of portions of the hide of which no one would have thought of making toplifts prior to the introduction of the condensed toplift, I produce another condensed toplift, together with the piece of leather from which the toplift was died out.

[*Condensed toplift is introduced in evidence, and marked "Defendants' Exhibit 159".*

Piece of leather from which Defendants' Exhibit 158 was cut is introduced in evidence, and marked "Defendants' Exhibit 160".]

[*Answer to Int. 80 continued:*]

As indicating the permanent character of the transformation in the lift effected by condensing it, it may be of interest to note that the toplift of Defendants' Exhibit 159 was condensed over two years ago.

This condensed toplift was received with great favor by shoe manufacturers, and has gone into very extensive use. Practically every toplift which is being used in Brockton is condensed.

In 1905 this condensed toplift was improved by incorporating in it the improvements shown in the drawings and set forth in the claims of patent No. 1,007,687, November 7, 1911, Glidden (appli-

cation filed January 9, 1907). The improvement of this Glidden patent facilitated the application of the toplift to heels by providing a roughened surface to receive the cement used to assist in holding the toplift to the heel, surrounded by a narrow plane surfaced rim to act as a dam for the purpose of preventing the cement from flowing out on the edge of the toplift and heel. Without this dam there would be danger that in the toplift "spanking" operation the cement would be squeezed out. This improvement is defined in the three claims of patent No. 1,007,687, of which the second claim is typical: —

"2. As an article of manufacture, a flat leather top lift for a heel having its inner flesh face provided with numerous separate, relatively shallow, depressions to receive and to retain an adhesive for uniting the lift to the adjacent lift of the heel and with a relatively narrow rim having a plane surface extending around the margin of the lift and constituting a closing wall or dam for preventing the exaudation of the adhesive from the depressions when the top lift is being attached to the body portion of the heel."

This improvement is embodied in the two condensed toplifts of Defendants' Exhibits 157 and 159, having been incorporated in substantially all condensed toplifts which have been produced since the adoption of the improvement in 1905. In 1905 the condensed toplift was also further improved, as shown and set forth in the claims of patent No. 890,434, June 9, 1908, Mayo. The nature of this improvement is indicated by claim 3 of that patent, which is as follows: —

"3. As an article of manufacture, a leather top lift, the edge of which comprises a beveled upper portion and a relatively narrow portion adjacent the tread face, substantially perpendicular to said face and arranged and shaped to serve as a guide in the trimming of the heel."

In explanation of this invention it may be well to add that in the heel-trimming operation the heel is guided by a thin plate, which engages the edge of the toplift closely adjacent to the tread face of the toplift. Securing of the proper contour of the heel depends, therefore, upon the shape of the toplift at its edge next to the tread face of the heel. On the other hand, the portion of the edge

between that guiding surface and the flesh side of the lift, which is next to the body of the heel, should be beveled to afford sufficient stock to be trimmed off in the shaping of the heel as a whole. Modern styles of shoes require more or less inclination for the edge of the heel.

The improvement of this Mayo patent No. 890,434 is embodied in both of the toplifts of Defendants' Exhibits 157 and 159, and all condensed toplifts made since this improvement was adopted in 1905 have incorporated this improvement. Mechanism for producing the toplift shown and defined in all of the seven claims of patent No. 890,434 is shown in the drawings and defined in the claims of patent No. 1,012,681, December 26, 1911, Mayo (application filed February 20, 1907). A typical claim of this patent is the third: —

"3. In a machine for molding and condensing top lifts, a plurality of relatively movable dies through which great pressure is exerted both upon the faces and the edge of a top lift to shape and condense it, said dies being constructed and arranged to enclose, when in molding position, a chamber of the area and height of a condensed top lift consisting of a single thickness of sole leather, those dies which act upon the faces of the top lift having generally plane parallel surfaces and those dies which act upon the edge of the top lift at the sides and rear comprising a beveled portion and a perpendicular portion for engaging the top lift, each of such engaging portions being of less height than the thickness of the top lift and the active perpendicular portion being of lesser height than the beveled portion."

This heel-compressing machine which I have been discussing, the official name of which is "Compressing Machine, Model No. 4, Automatic Heel", is put out by the United Shoe Machinery Company through its heeling department.

Mr. WEBSTER. Please note petitioner's objection to patents, and reference to patents, issued after the filing of the petition herein.

NAILING MACHINE: LOOSE.

[*Answer to Int. 80 continued:*]

I have explained how the heel and toplift are prepared for the heel-attaching operation, but before the heel is attached to the shoe the

heel end of the sole must be prepared for the reception of the heel. In welt shoes the out-seam, that is, the line of stitching which secures the out-sole to the welt, always terminates on each side of the shoe at a point near the position of the front edge or breast of the heel after the heel is attached to the shoe, and in the majority of McKay sewed shoes also the line of stitching which secures the out-sole to the insole terminates substantially at the breast of the heel. Accordingly, at the end of the out-sole attaching operation the heel ends of the soles of all welt shoes, and a large proportion of McKay sewed shoes, are unattached, and before the heel can be attached to a shoe the heel end of the sole must be attached to the shoe. This operation is known as "heel-seat nailing". This operation is usually performed by a machine known as a "Loose Nailing Machine". Such a machine, as its name implies, is a machine for driving previously formed nails, and probably received its name from the fact that the earlier types of nailing machines in the shoe industry formed the fastenings as well as inserted them. Owing to the character of the fastenings which it inserts, the loose nailing machine presents a difficult problem which put it in a class by itself. Of these problems the most striking are the necessity for separating successively each nail from the body of nails which precedes it in the raceway down which the nails travel toward the point where they are to be inserted, the presentation of the nails in proper position to be driven, the forming of an awl hole in the stock to receive each nail, placing this awl hole in position in alignment with the driver so that the nail may enter the hole properly, the clamping of the work to maintain the awl hole in alignment with the driver and to support the shoe against the blow of the driver, the clinching of the point of the nail as it emerges from the stock, the release of the clamping pressure on the work to permit feeding of the shoe to present a new awl hole in position for the next fastening, and, finally, the provision of necessary adjustments in most of these mechanisms for adapting the machine, first, for variations in the work being done from point to point, and, secondly, for operating upon the many different kinds of work which may be represented to it and for enabling the machine to perform

its operation upon each different kind of work in the desired manner.

The machine which was being put out just prior to February, 1899, by the McKay Shoe Machinery Company was constructed substantially as shown in the drawings and set forth in the claims of patent No. 490,624, January 24, 1893, Goddu. Typical claims of this patent are the following:—

"1. In a nailing machine, a driver bar, a driver, a nose, and an awl bar slotted transversely at its lower end to constitute an awl receiving slot, and a clamp, combined with an awl adjustable in said slot toward and from the driver, substantially as described."

"3. In a nailing machine a pivoted head B provided with a projection B^{14} to leave a slot as D^3, and a rock shaft D^2, having a grooved arm D^4, combined with a stud made adjustable in the slot of said arm, and provided with blocks D^7 to slide in the slot D^3, substantially as described."

The principal work for which loose-nailing machines were used just prior to February, 1899, and for which they have been used since that time, is the nailing of heel seats, and the majority of loose-nailing machines which are being put out are being supplied for nailing heel seats of welt shoes. The machine is especially organized for this work. As to the requirements for this work of nailing heel seats of welt shoes, in the first place the organization must include proper means for supporting the last which is still in a welt shoe at this stage of its manufacture, and for holding the last properly in position to have a row of nails inserted around the margin. In the second place, the machine must have proper mechanism for determining with relation to the outline of the heel end of the shoe the line in which the fastenings shall be inserted, and this requirement is complicated by the fact that the sole blank used in a welt shoe is a "blocked sole" like Defendants' Exhibit No. 102, and at the time that the heel seat is nailed the heel end of the sole has not been trimmed and consequently in the heel seat nailing operation it is impossible to guide the shoe by means of the edge of the sole. To adapt the loose-nailing machine for meeting the first of the requirements above indicated, that is, properly supporting the last, it was organized as put out just prior to Febru-

ary, 1899, with the work-supporting mechanism shown and defined in the claims of patent No. 919,424, April 27, 1909, Cuff (application filed June 20, 1899). The majority of the twenty-seven claims of this patent define the mechanism as it was used at that time. Typical claims are the first and the eighth : —

"1. In a jack, a bed, a rocking foot having a curved under side sustained by and adapted to rock on said bed, and a jack spindle joined to said foot and extending therefrom in a direction approximately radial to the curved under side of said foot."

"8. In a jack, a rocker bed, a rocking foot sustained on said bed, said foot rolling from end to end on said bed, during changing positions of the spindle, a jack spindle joined at its lower end to said rocking foot centrally between its ends, and means to adjust said rocker bed, foot and spindle vertically."

The work-supporting means defined in the claims of this patent No. 919,424 enable the work to be presented with the heel seat of the sole in a substantially horizontal plane as the heel seat nailing operation progresses around the heel.

The second requirement above set forth for the successful use of a loose-nailing machine in the operation of heel-seat nailing, that is, the proper positioning of the line of fastenings with relation to the outline of the heel end of the last, necessitates, first, that the work be located by means which shall engage the upper of the shoe, close to the sole, since, as I have explained, the shoe cannot, during this operation, be guided by the edge of the heel end of the blocked sole. Secondly, that this means for engaging the upper move up and down with the shoe as the shoe is raised or lowered to permit the feeding of the work. And third, this means must be so constructed and operated that it shall not interfere with the removal of the shoe after the operation has been completed, or with the introduction of another shoe. These problems were solved by including in the organization of the machine the work-engaging means which is shown in the drawings and set forth in all of the ten claims of patent No. 865,329, September 3, 1907, Casgrain (original application filed August 4, 1898).

A typical claim of this patent is the third :—

"3. In a mechanism for inserting fastenings, a presser, a yield-

ingly mounted support adjacent thereto and movable in a vertical path relatively to said presser, a work engaging member on said support and adjustable means to positively regulate the extent of the movement of the latter in both directions."

NAILING MACHINE: HUNGARIAN.

Just before February, 1899, this loose-nailing machine was organized for performing special work for which there was then, and has continued to be, a limited demand. This special work was the driving of what is known as "Hungarian nails", that is, nails having large, wear-resisting rounded heads, which are used in shoes made for laborers engaged in certain occupations. When the machine is equipped for this special work it is known as "Nailing Machine, Hungarian". These nails are difficult to handle both in moving them along the raceway on their way to the inserting position and in separating the endmost nail in turn to present it to the driver. The mechanism which especially adapts the machine for Hungarian nailing is shown in the drawings and set forth in the claims of patent No. 932,535, August 31, 1909, Casgrain (granted on an application filed April 27, 1900). Typical claims of this patent are 19 and 21 : —

"19. In a machine of the class described, the combination with a nail raceway of a knock-off device therefor, and means constructed and arranged to impart to said device a series of impulses of varying force in a prearranged order."

"21. In a machine of the class described, a nail raceway, a separator, and means for moving said separator behind the endmost nail in the raceway to discharge the same, said separator being constructed and arranged to overlie and engage the head and also engage the shank of the endmost nail thereby to maintain it in a vertical position while being discharged."

NAILING MACHINE: NO. 2, LOOSE.

Soon after the organization of the United Shoe Machinery Company experiments were started with a view to producing a new high-speed loose-nailing machine. The organization of the old machine as it was put out in February, 1899, absolutely limited the speed of that machine, which was regularly run in commercial use, to a speed of 350 nails per minute. There were many reasons

for this limited speed of the old 1899 machine, of which perhaps the most important was the fact that in order to get the awl, nail and driver substantially in the same vertical line, the whole front of the machine carrying the awl, the driver, the raceway and nail separator was arranged to swing back and forth for every nail-driving operation of the machine. The momentum of the heavy casting which was thus oscillated in both directions 350 times a minute caused excessive vibration in the machine which was prohibitive of a higher speed, and also precluded a proper handling of the nails at any speed substantially higher than the regular commercial speed of that machine, which, as I have stated, was 350 nails per minute.

The experiments looking toward the production of a new high-speed loose-nailing machine were begun in February, 1903, and covered a number of years, during which time two experimental machines were successively constructed and tried out before a machine was produced which was considered sufficiently satisfactory to justify trying it out in shoe factories. The third machine, after extensive experimental use in different shoe factories, and after the many changes and improvements which are always made in the course of such experimental use, as weaknesses develop in the machine, or necessity for further improvements to adapt the machine for various kinds of work is recognized, the machine was adopted as the company's standard commercial loose-nailing machine in 1909. This machine was radically different from the old machine of 1899 in all respects and every step in its operation was performed in a different manner. It is impracticable at this time to refer to all of the novel mechanisms embodied in the machine, and it will perhaps be sufficient to state that among the more striking improvements in this new machine which is known as "Nailing Machine No. 2, Loose", are, first, the organization for getting successively in the same vertical line the awl, nail, and driver; secondly, the mechanism for supporting and clamping the work and the arrangement for operating this supporting means to release the work to be fed between the insertion of successive nails, and finally to release the work at the end of the machine's operations to facilitate the removal of the shoe and the introduction of another

shoe; and, third, the organization of the entire machine including all of its operating parts so that a certain operation of every part of the machine is assured at high speed. The organization of this new machine, "Nailing Machine No. 2, Loose," is set forth in the claims of the following patents:—

No. 582,579, May 11, 1897, Cutter.

No. 856,399, June 11, 1907, Eaton.

No. 886,313, April 28, 1908, Cutter.

No. 932,535, August 31, 1909, Casgrain.

No. 1,011,941, December 19, 1911, Goddu (application filed May 10, 1910).

No. 1,030,775, June 25, 1912, Goddu (application filed February 8, 1909).

No. 1,031,438, July 2, 1912, Goddu (application filed October 10, 1907).

The commercial machine was and still is constructed substantially as shown in patent No. 1,030,775, June 25, 1912, Goddu.

When this machine is used for nailing heel seats of welt shoes and thereby preparing the heel ends of the soles of welt shoes for the reception of the heel in the heel-attaching operation, which is the most important use to which a loose nailing machine is put, it is also organized with mechanisms defined in the claims of patent No. 865,329, September 3, 1907, Casgrain, and patent No. 919,424, April 27, 1909, Cuff. Both of these patents were discussed by me, and typical claims quoted from them, in connection with my testimony in regard to the old loose nailing machine of 1899.

Referring to those patents on the list which I have just read, which represent the more notable improvements embodied in this new No. 2 loose nailing machine, the present standard commercial machine mechanism for controlling the operation of the work supporting and presenting means is defined in the claims of the following patents:—

No. 582,579, May 11, 1897, Cutter.

No. 1,011,941, December 19, 1911, Goddu (application filed May 10, 1910).

No. 1,031,438, July 2, 1912, Goddu (application filed October 10, 1907).

Claim No. 23 of patent No. 582,579 is as follows: —

"23. In a nailing machine, a stock support, a starting and stopping mechanism, a driving shaft, mechanism operated by said shaft to periodically depress said support to permit the feeding of the work, and independent means controlled by said starting and stopping mechanism to finally depress the horn when the machine is stopped, for the purpose set forth."

The first claim of patent No. 1,031,438 is as follows: —

"1. In a machine of the class described, the combination with a work support, of means for causing said working support normally to clamp the work, adapted to accommodate itself to varying thicknesses, means for intermittently suspending the operation of said first named means without disturbing the adjustment of the work support for the particular thickness clamped, and positively controlled means co-operating with said suspending means to positively lower the work support a uniform distance while the operation of said first named means is suspended and then to positively restore said work support to the control of said first named means."

An important characteristic of the nail-handling machine of this new No. 2 loose nailing machine is set forth in patent No. 586,313, April 28, 1908, Cutter, of which a typical claim is the seventeenth:

"17. In a nailing machine, an awl, a driver and a movable nail throat, means to actuate said awl to feed the work, means to move the nail throat out of the path of the awl during the feeding movement of said awl and means also actuated by said last named means for delivering a nail to said nail throat as said nail throat again comes into line beneath the driver."

Another important feature of this nail-handling mechanism is set forth in broad terms in the twenty-fourth claim of patent No. 932,535 August 31, 1909, Casgrain, which is as follows: —

"4. In a machine of the class described, the combination with a driver, a part provided with a passage for said driver, and a nail raceway, of a separator arranged for a two step nail separating movement, comprising an initial movement to separate the endmost nail in the raceway from the others, a dwell to permit the driver to ascend to clear the driver passage and a further movement to force the separated nail into the driver passage, and means to actuate said separator."

Patent No. 1,030,775, June 25, 1912, Goddu (application filed February 8, 1909), which, as I have already stated, shows sub-

stantially the commercial machine, defines in nearly all of its forty-six claims mechanisms embodied in the present standard commercial loose-nailing machine put out by the United Company. Typical claims of this patent are the following:—

"8. In a machine of the class described, the combination with a driver, a raceway and an awl, of a movable throat having a fastening receiving opening, means for bringing said awl and the fastening receiving opening of said throat alternately beneath the driver, and means for delivering a fastening from said raceway to said fastening receiving opening of said throat as said throat comes into position beneath the driver."

"10. In a machine of the class described, the combination with an awl and a fastening receiving throat movable alternately to the same point in direction substantially normal to each other, of means for controlling positively the movements of said awl and said throat, means for delivering a fastening to said throat, and means to drive said fastening into the awl hole while the throat is located at said point."

"18. In a machine of the class described, a driver, a fastening receiving throat and an awl movable alternately to a point beneath the driver in directions at substantially right angles to each other, a raceway in the line of movement of said awl, means for controlling positively the movements of said awl and said throat, a separator movable with said throat into co-operative relation to said raceway, and yielding connections between said separator and said throat whereby misplaced fastenings will not interfere with the timing of the movements of the positively controlled parts."

"25. A machine of the class described, having, in combination, a raceway, a driver guide provided with a driver passage into which said raceway opens, a driveway and separator constructed to move the shank of the fastening into the driver passage in advance of the head, means for operating said driver and said separator constructed and arranged to operate therein in such time relation to each other that the separator traps in the driver passage the shank of the endmost fastening in the raceway while the driver retains the head of said fastening in the raceway and that then there is a dwell in the movement of the separator while the driver rises to release the head of said fastening."

"45. A machine of the class described, having, in combination, an awl, means for moving said awl to feed the work, a fastening receiving throat normally located within the path of the work feeding movement of said awl and movable transversely to said path to place it out of the way of the awl during its work feeding movement, a driver and means for imparting to said driver a quick

upward movement to clear the throat in advance of the work feeding movement of said awl."

The organization in the loose nailing machine set forth in the claims which have just been quoted solved the problems of getting the awl, nail and driver successively in the same location by operations which together impose so light a burden upon the machine that the organization permits the running of the machine at practically any speed which is desired.

Machines constructed substantially as set forth in the patents which have been discussed, but also embodying other mechanisms defined in the claims of other patents as well as some mechanisms on which patents have not as yet been granted, are being tried out under commercial conditions in shoe factories and will probably soon be adopted. These mechanisms adapt this loose-nailing machine No. 2 for a new class of work, that is, for attaching out-soles of the cheaper grades of shoes by what is known as "all around nailing". Improvements which adapt the machine for that special work have to do with the automatic supplying of nails of different lengths according to the thickness of the stock being operated upon. In most shoes of the class for which this machine will be used there is a substantial difference between the thickness of the stock in the forepart and in the shank and a longer nail is required for the forepart than the shank.

The minimum speed at which this No. 2 loose-nailing machine, the present standard commercial loose-nailing machine, is being operated in shoe factories is 525 nails per minute, which is a capacity fifty per cent greater than that of the old 1899 loose-nailing machine, which, as I have stated, was run regularly at a speed of 350 nails per minute. In many factories the new loose-nailing machine is speeded up to 550 or 600 nails per minute.

This loose-nailing machine No. 2 is put out by the United Company through its metallic department. Up to September 1, 1913, 442 of the new machines had been put into use. One of these machines is adapted to nail heel seats of shoes which have been operated upon by from five to seven welt and turn sewing machines.

Heel Attaching Machines.

For the heel-attaching operation there were used, just prior to February, 1899, two types of machines, both of which were being supplied to shoe manufacturers by the McKay Shoe Machinery Company, one of the predecessors of the United Shoe Machinery Company. One of these machines was then known as the "Improved Rapid Nailer", and now as improved from time to time since that date, as the "Loading and Attaching Machine, McKay Automatic Heel". The other machine was known as the "American Lightning Nailing Machine". The first of these machines, the improved rapid nailer as it was known in 1899, was adapted for attaching heels of McKay sewed shoes and the heavier kinds of shoes, such as nailed, pegged and standard screwed shoes. The other machine, the American lightning nailing machine, was used to attach the heels of welt shoes. While these two machines were very differently organized, and while there were certain fundamental differences between them which I shall later point out, they were both provided with means for supporting the work, with means for presenting a heel in proper relation to the heel end of the shoe for attachment to the shoe, and for subsequently presenting a toplift to be attached to the heel, with means for successively presenting the heel against the shoe and the toplift against the heel, and with means for driving nails through the heel to attach it to the shoe. In both types of machines on the better classes of work the nails which attached the heel to the shoe were left projecting slightly above the surface of the heel and the toplift was attached to the heel by forcing it upon the projecting head ends of the nails. This toplift attaching operation is known in the trade as toplift "spanking", and heels having their toplifts attached in this manner are called "blind nailed heels", probably because the head ends of the nails are not visible in the finished shoe as they do not project entirely through the toplift. On the cheapest grades of shoes the toplift is not separate from the heel and the attaching nails are driven through both the toplift and the heel.

LOADING AND ATTACHING MACHINE: MCKAY AUTOMATIC HEEL (IMPROVED RAPID NAILER).

The average capacity of the improved rapid nailer in 1899 was nearly twice the average capacity of the lightning machine and consequently the improved rapid nailing machine was used almost exclusively in the attaching of the heels of McKay sewed shoes and for the cheaper grades of shoes for which work it was intended and particularly adapted. The most striking feature of the organization of the improved rapid nailer was the mechanism by which the required number of nails for each heel were taken automatically from a mass of nails in a hopper, were arranged automatically, all with their points extending in the same direction, and were presented in the required horseshoe-shaped outline in proper position to be driven into the heel at the proper time. The improved rapid nailer was the first commercial machine comprising such an organization. The immediate predecessor of this machine was the McKay rapid nailer, which was not provided with any nail-arranging or nail-handling mechanism and which, as I have stated in previous testimony, required that the heel be "loaded" before it was operated upon by the machine. As I have explained, a loaded heel is a heel in which nail holes have been formed and the nails have been partially inserted before the heel-attaching operation. This McKay rapid nailer had been superseded by the improved rapid nailer just before the organization of the United Shoe Machinery Company, and each improved rapid nailer when run to full capacity was effecting a saving of from one dollar to three dollars a day as compared with the old machine when run to full capacity. The improvements which contributed to this greater capacity of the improved rapid nailer are shown and described in the claims of patents —

No. 694,656, March 4, 1902, Mayo (application filed March 3, 1897);

No. 707,136, August 19, 1902, Mayo (application filed June 15, 1898);

No. 707,139, August 19, 1902, Mayo (original application filed February 25, 1898).

The machine as first put out embodied the improvements defined in all of the fifty-eight claims of the first patent on the above list, No. 694,656. Many of these claims define in varying terms the organization of the nail-supplying and heel-attaching mechanisms as always embodied in the improved rapid nailer and in the machine now put out and known as "Loading and Attaching Machine, McKay Automatic Heel". A typical claim directed to the organization of the machine is claim 45 : —

"45. A heel attaching machine comprising mechanism for supporting a shoe and for presenting a heel to be attached to the shoe, nail driving mechanism, nail assorting mechanism, a movable device to transfer nails from the nail assorting mechanism to the nail driving mechanism and means for delivering nails from the nail assorting mechanism to the transferring device."

This machine of 1899 also comprised means for automatically presenting a heel and a toplift successively in proper relation to the shoe. A number of claims of this patent 694,656 are directed to this feature of the organization of the machine. Among its claims are 28 and 48, which are as follows : —

"28. In a heeling machine, a nail block, a heel holder and a top lift holder movable independently of said nail block, and means to adjust one of said holders with relation to the other to insure the application of the top lift in proper position with relation to the attached heel."

"48. In a heel attaching machine, mechanism for securing a heel to a shoe, a heel holder, and a top lift carrier, means to place the heel holder in position for the heel to be attached to the shoe, means for locking the heel holder in said position and automatic means to remove the heel holder and put the top lift carrier in position for the top lift to be attached to the heel."

The organization shown in this patent No. 694,656 for taking the nails from a mass of nails in a hopper and delivering them, all pointed in the same direction, did not prove commercially satisfactory because it failed frequently to deliver the full number of nails required, and also frequently failed to arrange the nails all pointed in the same direction. Failure in either of these respects was sufficient to prevent the commercial success of the nail-handling organization. Accordingly, prior to February, 1899, this nail-handling

organization was improved by incorporating in it the mechanism shown in patent No. 707,139, August 19, 1902, Mayo (application filed February 25, 1898).

The improved mechanism is set forth in all of the claims of that patent, of which a typical claim directed to the mechanisms for arranging the points of the nails all in the same direction, is the first: —

"1. In a nail assorting mechanism, a raceway to receive and guide nails, a device to reverse the nails traveling point first on said raceway, and means to prevent said device from acting on the nails traveling head first on said raceway."

A characteristic feature of the organization of all the various types of nail arranging mechanisms which have been used on heel-attaching machines is a slightly inclined table comprising a large number of raceways down which the nails are made to travel by rapid, short reciprocations of the table lengthwise of the raceways. In the operation of the machine provided with the nail-handling organization of patent No. 694,656, it was found that the reciprocations of the nail-arranging mechanism jarred it to such an extent as frequently to knock the nails off the raceways. This difficulty was ingeniously overcome by the improvement defined in the claims of patent No. 707,136, August 19, 1902, Mayo (application filed June 15, 1898). A typical claim of this patent is the first: —

"In a nail assorting mechanism, a raceway composed of a plurality of grooved transversely arranged plates, and means to move them independently simultaneously in opposite directions, substantially as described."

By dividing the raceway-carrying table into two plates and by reciprocating these two plates in opposite directions the momentum of the two plates neutralized each other sufficiently to overcome most of the difficulty occasioned by the excessive jarring of the nails on the raceways, which was the reason for the commercial failure of the earlier construction, as has been explained.

The machine as shown in patent No. 694,656, March 4, 1902 (application filed March 3, 1897), with the improvements which have just been discussed, was the commercial heel-attaching machine being put out by the McKay Shoe Machinery Company just

prior to February, 1899. For a short time after its formation the United Shoe Machinery Company continued to put out this machine in substantially the same form that it had been put out by the McKay Shoe Machinery Company. Immediately after the organization of the United Company experimental work was undertaken and carried on continuously for a period of several years looking toward the improvement of this improved rapid nailer to make it perform its work more satisfactorily. The attention of the United Company's inventors was first directed toward remedying the difficulties that were still encountered in the operation of the mechanism for arranging and delivering the nails all with their points in the same direction. One difficulty with this mechanism was its failure always to deliver nails properly to the nail block after they had been arranged all with their points in the same direction. This difficulty was due to the fact that in the organization of the heel-attaching machine the heel and toplift holder must necessarily move in their heel and toplift delivering operations between the nail block and the device for transferring nails from the nail-arranging mechanism to the nail block. There was, consequently, so much space between this device and the nail block that the nails frequently failed to enter the nail block properly. This difficulty was overcome in 1900 by adding to the organization a nail guide located between the nail-transferring device and the nail block. This improvement is defined in a number of claims of patent No. 884,513, April 14, 1908 (application filed January 10, 1902, Mayo). A typical claim directed to this improvement is the third:—

"3. In a machine of the class described, a nail block, a transferrer to present nails to the nail block, and a nail guide fixed in its position with relation to said transferrer and interposed between the nail holes of the transferrer and the nail holes in said nail block to guide the nails after leaving the transferrer on their way into the holes of the nail block."

Occasional failure of long nails on their way from the point-arranging mechanism to the transferring device, to enter properly the nail-receiving holes in the transferring device, was remedied by providing a "nail gauge", which is defined in a number of claims of this patent No. 884,513, of which a typical claim is the sixth:—

"6. In a heel-nailing machine, a nail transferrer provided with a nail receiver to receive nails and present them to a nail block, combined with an independent detachable nail gauge sustained by said nail receiver and having holes normally in line with the nail holes of said receiver."

The heel and toplift holding mechanism of the machine were also improved by the incorporation in the machine in 1900 of an improvement also defined in the claims of this patent No. 884,513, of which claim 22 is typical: —

"22. In a heel-nailing machine, a plate having a guideway, a breast gauge having its shank held loosely in said guideway, a back gauge, means to move said back gauge to adapt the same to the work to be done, and a spring connected at one end to said breast gauge, and at its opposite end adjustably connected to said plate, that the pressure of the breast gauge may be exerted uniformly on the stock held between it and the back gauge, whatever its size."

The machine was further substantially improved in 1900 by improvements shown in the drawings and set forth in the claims of patent No. 1,030,654, June 25, 1912, Elliott (original application filed March 13, 1902). The most important of the improvements defined by the claims of this patent was a reorganization of the mechanism for imparting yielding pressure to the shoe and the heel prior to and during the operation of driving the nails. This improvement is defined in several claims of patent No. 1,030,654, of which claim No. 19 is typical: —

"19. In a nailing machine, a driver carrying head, a set of drivers, spring sustainers depending from said head, a nail block head, a nail block, rods extending from said nail block head and guided by said driver carrying head, springs surrounding and supporting said rods and sustained by said spring sustainers, and means to move said driver carrying head positively in attaching a heel to a sole, the nail block head deriving a yielding movement from said springs whereby the nail block mounted on the nail block head is adapted to compress and hold the heel against the sole while the drivers act to drive nails contained in the nail block into the heel."

An improvement adding to the convenience of the operator and saving much of his time is defined in a number of the claims of this patent No. 1,030,654, of which No. 21 is typical: —

"21. In a nailing machine, a foot plate having a series of nail holes, and a guideway; combined with a mug having its nail holes arranged to correspond with some but not all the holes of said plate, and shaped to engage said guideway."

An improvement contributing to more accurate work of the machine is defined in a number of claims of this patent, of which the following is typical: —

"25. In a nailing machine, a band clamp holder, provided with an adjustable stop and a band clamp, the inner position of which is determined by the position of said stop in said holder."

The attention of the United Company's inventors was next directed toward improving the mechanism for taking the nails from bulk in a hopper, arranging the number of the nails required for the particular kind of work being done, with their points all in the same direction, and delivering them in position for the nail-driving operation. Despite numerous improvements which had been made in this mechanism shortly before 1899, considerable difficulty was still being experienced with it, particularly in the mechanism for getting the nails from the hopper on the raceways, and in the mechanism for delivering from the raceways to the device which transferred the nails to the nail block, in failing to supply the full number of nails required for each driving operation. The latter difficulty was remedied in 1902, by providing the organization with means which stopped momentarily the reciprocation of the raceways while each group of nails was being delivered. This improvement is set forth in the claims of patent No. 707,137, August 19, 1902, Mayo. A typical claim is the twenty-third: —

"23. In a nail assorting mechanism a raceway, a device to transfer nails from the raceways, means to reciprocate the raceway, and means for intermittently stopping the reciprocation of the raceway while the transferring device operates."

The difficulty which had been encountered in supplying to the raceways the proper number of nails required for each attaching operation was overcome in 1902 by the improvements of patent No. 707,138, August 19, 1902, Mayo and Elliott. Nine of the ten claims of this patent set forth improvements which were then

adopted, and many of the improvements have been retained in the nail-handling mechanism of this machine through its successive stages of development since that time. A typical claim of the patent setting forth mechanism which has always been used since 1902 is the ninth: —

"9. In a machine of the class described, a raceway for receiving and guiding nails, said raceway having provision for rejecting nails not properly lodged thereon, a returning table for receiving and conveying the rejected nails, and a rotary magazine for supplying nails in bulk to the raceway and having an opening in one side to permit the return of nails to the magazine by the returning table."

Other improvements in the general organization of the machine have been made from time to time and the machine has also been provided, as required in the development of the industry, with improvements enabling it to operate satisfactorily on special kinds of work, for example, spring-heeled shoes and rubber-heeled shoes, and these improvements are defined in the claims of so many patents that it is not practicable to discuss them here. Some of these improvements are defined in the claims of pending applications. In the aggregate, including the patents to which I have specifically referred, the improvements now embodied in the commercial heel-attaching machine put out by the United Company for McKay work, that is, the "Loading and Attaching Machine, McKay Automatic Heel", embodies improvements set forth in the claims of more than twenty patents.

This machine is the present standard commercial machine put out by the United Company for attaching the heels of McKay sewed shoes and of shoes having their soles attached by wooden pegs, nails, or standard screws. Up to the end of the company's last fiscal year, March 1, 1913, 1567 of these machines had been put out. The machine has a large capacity and its output is about 1500 pairs per day. It is put out by the United Company through its heeling department.

BOSTON, MASS., October 15, 1913.

NAILING MACHINE: AMERICAN LIGHTNING.

[*Answer to Int. 80 continued:*]

In the manufacture of a welt shoe the last remains in the shoe, as a rule, throughout all the stages of the manufacture of the shoe. Accordingly, the last is still in the shoe when the heel is attached. It is clear, therefore, that the amount of pressure which can be exerted by the machine during the heel-attaching operation must be regulated, otherwise there would be danger of frequently breaking the lasts by excessive pressure as the stock upon which the pressure is exerted, comprising the heel, out-sole and insole, always varies somewhat in height in successive shoes operated upon by the machine. The American Lightning nailing machine is organized to meet these conditions, and was especially designed for attaching the heels of welt shoes while they are still upon the last. The construction of this machine just prior to February, 1899, was substantially as shown in patent No. 446,885, February 24, 1891, Pope. Ten of the thirteen claims of that patent set forth mechanisms which were embodied in the Lightning heeling machine at that time, that is, in 1899. One of the most important features of the organization of the machine was the means for preventing excessive pressure to avoid breaking the wooden lasts upon which the shoes were heeled. A typical claim directed to the means for accomplishing this purpose is the fifth:—

"5. In a heel nailing machine, the combination of a main frame, a stationary, perforated die block, a reciprocating nail driver block, a sliding jack, a jack support provided with a jack screw having a pinion, a horizontally reciprocating rack engaging the pinion, and a treadle mechanism connected with the rack to reciprocate the same for raising and lowering the jack, substantially as described."

The usual operation of the organization defined in the claim which has just been quoted was this: After jacking the shoe, that is, mounting it upon the work support, the operator brought the shoe into contact with the heel which was held against the stationary nail block by operating a foot treadle, in this manner exerting

upon the shoe and heel the preliminary measuring pressure which, broadly speaking, was manually effected. The operator then started the machine, and a predetermined amount of additional pressure sufficient to force the heel properly against the shoe was automatically applied by the machine, and then the attaching nails were driven and the toplift was attached. This operation was fundamentally different from that of the machine which I have discussed in my previous testimony, known as the "Improved Rapid Nailer", which, as I have explained, was the standard machine just prior to February, 1899, for attaching the heels of McKay sewed shoes, and for the heavier grades of shoes, including pegged, standard screwed and nailed shoes. The operation of the improved rapid nailer was automatic throughout, and as there was no means for measuring in any manner the pressure exerted by the machine, that pressure was greater for a higher heel. If it were attempted to attach the heel to a shoe on a wooden last by means of the improved rapid nailer, the last would almost always be broken when the stock, including the heel and the two soles, was thicker than the average. At this time, that is, just prior to February, 1899, the American Lightning heel nailing machine, which, for convenience, I shall refer to as the "lightning heeler", also incorporated mechanism set forth in the claims of a number of other patents. The heel blank-holding mechanism of the machine, which was organized to handle and to present properly to the nail-driving mechanism any heel blank of whatever size, was set forth in the claims of patent No. 584,752, June 15, 1897, Small.

The organization of means for providing the machine with the proper number of nails for each attaching operation, comprising two independent sets of mechanism which were operated alternately and which added considerably to the capacity of the machine, is defined in claim 6 of patent No. 599,012, February 15, 1898, Raymond, which is as follows: —

"6. The combination in a heel nailing machine, with the nail driving devices, of the templet and the nail carrier plates C^2, C^3, supported by their respective holding plates, one of which nail carrier plates is pivoted at one side of the median line of the templet

from front to rear, and the other of which nail carrier plates is pivoted upon the opposite side thereof, substantially as described."

The means for exerting automatically the final pressure upon the heel and shoe just prior to the driving of the nail, which is an important feature of the organization of the Lightning heeler, is defined in many claims of patent No. 891,192, June 16, 1908, Small. Typical claims of this patent directed to this feature of the organization of the machine are 39 and 49: —

"39. A machine for attaching heels, having in combination, a templet provided with driver passages, and a work support arranged for vertical movement toward and from the templet, and means for raising said work support vertically to subject the work to pressure between said support and the templet, comprising a cam arranged in substantial alignment with the driver passages."

"49. A machine for attaching heels, having in combination, a templet provided with driver passages, drivers arranged for movement in said passages, a movable pressure head, means for guiding said pressure head in a vertical path, a work support arranged to be moved vertically toward the templet by the pressure head, and a cam arranged to sustain said pressure head and in substantial alignment with the driver passages, and constructed to move the work support toward the templet and to hold the work under pressure during the driving of the nails."

Another important feature of the organization of the Lightning heeler consisted in the means which permitted adjustment of the automatic mechanism for applying the final pressure to adapt that mechanism for varying heights of heels. This improvement is also defined in the Small patent No. 891,192, June 16, 1908, and a typical claim is the fortieth: —

"40. The combination in a heel nailing machine of the templet, the work support, a vertically movable spindle supporting the same, a vertically movable pressure head, a device in alignment with the pressure head for actuating the pressure head, and an auxiliary head and means for varying its position upon the pressure head."

Including the claims directed to the features of the organization of the Lightning heeler, to which reference has already been made, this Small patent No. 891,192 contains sixteen claims which set forth features of the organization of the lightning heeling machine as it has been constructed for a number of years.

Among the improvements which have been made upon the Lightning heeling machine since February, 1899, is an improved means for supporting heels of the shoes made on unusually unsymmetrical lasts. The quality of the work was substantially improved by the adoption in the machine in 1900 of this improvement which is defined in allowed claims of a pending application filed May 17, 1901.

In 1905 the Lightning heeler was substantially reorganized to adapt it for attaching what are known as "high pitched" heels, that is, high heels which have their edge surfaces at the rear end sharply inclined backwardly from the tread face of the heel toward the upper, and which also have their breast faces inclined backwardly from the tread faces toward the sole of the shoe. About 1904, manufacturers of women's shoes began to make shoes with high-pitched heels in largely increasing numbers, and since that time the proportion of women's shoes made with high-pitched heels has been steadily increasing so that for a number of years the majority of all women's shoes have been made with this type of heel.

I produce a shoe which has a high pitched-heel, such as I have been describing.

[*Shoe having high-pitched heel is offered in evidence and marked "Defendants' Exhibit 161".*]

[*Answer to Int. 80 continued:*]

The abnormal shape of this heel requires that the attaching nails, in order to secure the heel properly, be driven at an inclination to the tread face of the heel. The reorganization of the Lightning heeler in 1905 enabled the machine to attach such heels properly by driving the nails at an inclination from the tread face toward the rear end of the heel at its junction with the end of the sole. The reorganized machine embodied improvements defined broadly in eleven claims of patent No. 1,000,957, August 15, 1911, Bates, granted upon an application originally filed August 15, 1903. A typical claim of this Bates patent is the following: —

"47. A machine for operating on heels having in combination, a pressure resisting member for engaging one side of the heel, a

gang of tools located on the opposite side of the heel and mounted to reciprocate toward and from said member, and a work engaging plate provided with perforations in alignment with said tools, all of said tools being inclined in the same general direction from normal to the work engaging face of said plate at the points at which the paths of the tools intersect said face and moving throughout their reciprocations in right line paths."

It may be of interest to note in connection with this Bates patent that the heeling machine constructed by Thomas G. Plant embodied improvements defined in a large number of claims of this patent.

The commercial construction of the Lightning heeler as reorganized in 1905 to adapt it for the attaching of high-pitched heels was almost identical, as shown in the drawings, described in the specifications and set forth in the claims of patent No. 887,870, May 19, 1908, Taylor (application filed August 8, 1904). The organization is set forth in thirteen of the claims of this patent, somewhat more specifically than in the Bates patent, No. 1,000,957, August 15, 1811, Bates, to which the Taylor patent is subordinate. Typical claims of the Taylor patent 887,870 are the first and tenth : —

"1. In a machine of the class described, the combination, with mechanism for driving vertically a group of nails, of means for holding a heel under pressure in oblique position with relation to the path of the nails."

"10. A heel attaching machine comprising mechanism for driving nails into a heel in an inclined direction, and means to spank a toplift on the ends of the nails in a direction parallel with the path of the nails."

The product of the Lightning heeler as reorganized in 1905 to insert heel-attaching nails at an inclination is defined in the three claims of patent 834,085, October 23, 1906, Taylor. A typical claim of this patent is the seconk : —

"2. In a boot or shoe, a heel comprising a series of lifts secured to the boot or shoe by nails having a uniform inclination from the treadface of the heel toward the rear of the heel, said nails being arranged over substantially the entire area of the treadface of the heel."

This patent No. 834,085 illustrates clearly in its drawings the type of heel to which I am referring and the advantages of driving

the heel-attaching nails at an inclination. It may be of interest to note here, also, that the product of the Plant heel-attaching machine is well described in all of the three claims of this patent No. 834,085.

While the reorganized Lightning heeler was successfully used for a number of years after 1905, the pressure necessarily exerted upon the heel preliminary to the operation of driving the nails was exerted at an oblique angle to the nail block, which constituted one of the pressure-applying members. This difficulty was remedied by one of the United Company's inventors by so reorganizing the machine that the heel-engaging nail block is at a right angle to the line of pressure exerted by the machine. This improvement is defined in all of the thirteen claims of patent No. 1,072,986, granted September 9, 1913, Pope (application filed January 12, 1911). A typical claim is the second:—

"2. A heeling machine having, in combination, a plate provided with a heel engaging face and a plurality of guiding passages extending at an inclination to said face, a full gang of tools for operating on a heel mounted obliquely and parallel with the guiding passages in said plate, said tools being movable into and out of said passages, and means for guiding said tools for movement in a vertical path while out of said passages, said means being constructed and arranged to permit the tools to move out of operative relation thereto on entering the guiding passages, whereby they may be guided in an oblique path by the guiding passages."

This improved inclined nailing organization which was incorporated in the machine early in July, 1911, is also defined in somewhat broader terms in two claims of patent No. 958,302, May 17, 1910, Plant. One of these claims is 16:—

"16. In a heeling machine, the combination with devices for operating on a heel, a nail block having apertures for the reception of said devices and means for moving said parts relatively toward and from each other, of means for guiding said devices and apertures into alignment, said means being constructed and arranged to lose control of the moving parts after said devices and apertures have become engaged."

The adoption of this improved organization which is constructed substantially as illustrated in the drawings of the Pope patent No.

1,072,986, above referred to, was prevented for some time because of the two claims in the Plant patent No. 958,302, to which I have referred, and the improvement was not adopted until after the Plant patent had been acquired by the United Company.

The importance of this inclined nailing organization may be judged from the fact that since December, 1905, over 60 per cent of all the Lightning heelers which have been put out have been organized as set forth in the Taylor patent No. 834,085, October 23, 1906, and as set forth more broadly in the claims of patent No. 1,000,957, August 15, 1911, Bates, which have been discussed in detail above. The proportion of the reorganized machines which have been supplied to manufacturers has been steadily increasing since December, 1909, over 70 per cent of all machines shipped having been so organized. A large number of machines which had been put out prior to the reorganization of the machine in 1905 have, at the request of the manufacturers using these machines, been reorganized to embody these improvements so that a large majority of all Lightning heelers which are now in use are organized to include these inventions. While, as has been stated, the reorganized Lightning heeler was originally intended for the attaching of high-pitched heels of women's shoes, it is advantageous to attach nearly all heels by means of this organization, and it is now being largely used on all classes of work. Its use on nearly every type of heel secures better attachment of the heel because most heels at their rear ends are inclined backwardly from the tread face toward the upper, and because in nailing practically all heels it is necessary to have the head ends of the nails a substantial distance from the edge of the toplift so as not to interfere with the insertion of slugs in the toplift, and it is also important that the points of the nails be clinched as near as possible to the edge of the sole in order to prevent any danger of the heel breaking away from the sole around the rear end and leaving a disfiguring space between the heel and the out-sole. Accordingly, to secure these advantages, the majority of all kinds of heels on welt shoes are now being attached by nails driven at an inclination rearwardly from the tread face of the toplift toward the sole.

The Lightning heeler has recently been again reorganized so that its operation is now entirely automatic. Until these recent improvements the preliminary heel-measuring engagement of the heel and shoe had always been secured by a treadle-operated mechanism, as was fully explained in a previous part of my testimony. In the new organization of the machine this preliminary measuring pressure is effected automatically. By this improvement the capacity of the machine is substantially increased and a more uniform and more accurate measuring operation is secured, since in the machine as formerly constructed the treadle-effected pressure varied with the force exerted by the operator in depressing the treadle. A substantial saving is also effected in lasts. The operator of the Lightning heeler would occasionally apply too much preliminary measuring pressure to the shoe, so that the final automatic pressure was excessive and would break the last. The commercial form of this newly organized Lightning heeler is shown approximately in a pending application filed in July, 1912, but it also embodies improvements defined in the claims of another pending application filed May 7, 1909, and two pending applications filed respectively September 9, 1910, and November 2, 1910.

An important feature of the reorganized automatic Lightning heeler is defined in several claims of patent No. 958,282, May 17, 1910, Plant, of which a typical claim is the fourth: —

"4. In a heel nailing machine, heel attaching mechanism, means for operating the same, devices for starting said means into operation, said devices being normally locked against movement in a direction to operate said mechanism, heel measuring mechanism, and means controlled by the heel measuring mechanism to unlock the said devices and permit operation of the heel attaching operating means."

Loading and Attaching Machine — Model B: McKay Automatic Heel.

In November, 1910, some time before the reorganization of the Lightning heeler to render that machine entirely automatic, there was first put out for commercial use by the United Company a machine for attaching heels of welt shoes, known officially as "Load-

ing and Attaching Machine, McKay Automatic Heel, Model B." This machine is now the standard commercial machine of the United Company for attaching heels of welt shoes. The Lightning heeler continues, however, to be in some demand as manufacturers already equipped with Lightning heelers may not, when they need an additional heeling machine, be prepared to change over all their machines and substitute the entirely different model B heelers, and, accordingly, when they need an additional machine they order the Lightning machine. That machine is also preferred and probably will be preferred for an indefinite period by those manufacturers who prefer to attach heels while the shoe is bottom side up. In the new loading and attaching machine, McKay automatic heel, model B, which for convenience I shall hereafter refer to as the model B machine, the heel is attached while the shoe is right side up, and some manufacturers believe that their operators cannot observe the heel-attaching operation so satisfactorily while the shoe is in that position, that is, with the sole and heel on the under side of the shoe. It also seems probable that in view of the reorganization of the Lightning heeler, making that machine entirely automatic in its operation, there will continue to be a substantial demand for that machine particularly from manufacturers who wish to attach their heels while the shoe is bottom side up, but the large majority of manufacturers will prefer the model B machine because it has a substantially increased capacity over the Lightning heeler.

The production of the model B machine is the result of a long period of experimenting which began even before the formation of the United Company and has been carried on practically continuously by its inventors ever since, in the endeavor to produce a machine for attaching the heels of welt shoes which would apply automatically the preliminary heel-measuring pressure to the heel and shoe. These efforts have been mainly directed toward producing an entirely automatic machine on the lines of the loading and attaching machine, McKay automatic heel, which, as has been explained, is the standard heel-attaching machine put out by the United Company for attaching the heels of McKay sewed shoes. The reason for the desire to produce a welt heel-attaching machine

on the lines of the loading and attaching machine, McKay automatic heel, was that that machine on McKay work had a very large capacity, and it was anticipated that a similar increased capacity could be secured for the machine when used upon welt work if it should prove possible to organize the machine for that work.

The model B machine, first put out for commercial use in November, 1910, was produced as the result of this long period of experimenting and was the first machine ever used commercially which would automatically apply the preliminary heel-measuring pressure. By this machine was solved for the first time the great problem with which inventors had dealt for over a dozen years, of securing an automatic preliminary heel-measuring pressure in such a manner that the final pressure upon the heel would not break the last.

The commercial construction of this new model B heeler is not shown in any patent which has as yet been granted, but the organization of the machine is set forth in broad terms in a number of patents to which I will now refer.

One of these patents defines in numerous claims the organization of the machine by which the final positive pressure of the heel and shoe to hold them properly pressed together during the driving of the nails is effected independently of the operation of the nail-driving mechanism. This patent is No. 1,000,119, August 8, 1911, Pope and Elliott (application filed May 26, 1898). Typical claims of this patent are the following: —

"6. In a heel attaching machine a rigidly sustained shoe support, a nail block adopted to support a heel and having a series of driver passages, means for positively actuating said nail block for forcing the heel sustained thereon against a shoe upon said support, and compressing said heel, a series of drivers projecting at all times into the driver passages of the nail block, and means for moving said drivers while the nail block is substantially at rest, for driving nails through the heel and into the sole of the shoe."

"11. In a heel attaching machine, a nail block provided with driver passages, nail drivers arranged to project at all times into the passages of the nail block, means for positively actuating said nail block to compress the heel and means for thereafter actuating the drivers independently of the nail block to drive nails through the heel into the shoe."

In prior organizations of this type of machine the pressure effected by the nail block was imparted first yieldingly and then positively through connections with the driver-actuating spindle so that the maximum pressure on the heel and shoe was not exerted until the very end of the nail-driving operation. In the prior construction there was danger of sidewise displacement of the heel during the driving operation, but in the new organization of the model B machine all the pressure which the heel is to receive is imparted before the nail-driving operation begins, and danger of this lateral displacement is entirely obviated.

Further features of this improvement are defined in claim 11 of patent No. 958,282, May 17, 1910, Plant.

In recognition of the superior quality of work secured by nailing all kinds of heels by driving the heel-attaching nails at an inclination, as has been fully explained, this model B machine has, ever since it was first put out, been regularly organized for driving the attaching nails at an inclination to the tread face of the heel, and accordingly the machine always embodies the improvements defined broadly in the claims of patent No. 1,000,957, August 15, 1911, Bates, and also the improvements defined in the claims of patent No. 1,072,986, September 9, 1913, Pope (granted on an application filed January 12, 1911).

Both of these patents were discussed at length in my previous testimony relating to the Lightning heel-attaching machine. The product of the machine is defined in the claims of patent No. 834,085, October 23, 1906, Taylor.

It is impracticable to discuss in any detail the improvements set forth in the claims of all the other numerous patents which are embodied in this model B heeling machine. Attention should, however, be called to the fact that this machine includes in its organization mechanism for taking nails from bulk, arranging them with their points all in the same direction, and presenting them in horseshoe shape outline as required for the heel-attaching operation. The improvements embodied in this organization are defined in the claims of seven patents which have been discussed in the previous testimony in regard to the loading and attaching machine,

McKay automatic heel. This model B machine also embodies the improvements broadly set forth in the claims of patent No. 694,656, March 4, 1902, Mayo, which, as has been previously explained, disclosed the first commercial machine comprising the organization with heel-nailing mechanism of means for taking from bulk the required number of nails and presenting them, all pointing the same way, properly located for the nail-driving operation.

Without referring in detail to any other patents, I will state that the model B heeling machine as now supplied to shoe manufacturers embodies improvements set forth in the following eighteen patents: —

No. 571,931, November 24, 1896, Raymond *et al.*

No. 577,241, February 16, 1897, Elliott and Glidden.

No. 589,501, September 7, 1897, Glidden.

No. 611,370, September 27, 1898, Winter.

No. 694,656, March 4, 1902, Mayo.

No. 707,136, August 19, 1902, Mayo.

No. 707,137, August 19, 1902, Mayo.

No. 707,138, August 19, 1902, Mayo and Elliott.

No. 707,143, August 19, 1902, Lougee.

No. 884,513, April 14, 1908, Mayo.

No. 884,524, April 14, 1908, Pope.

No. 958,281, May 17, 1910, Plant.

No. 958,282, May 17, 1910, Plant.

No. 1,000,119, August 8, 1911, Pope and Elliott.

No. 1,000,957, August 15, 1911, Bates.

No. 1,005,303, October 10, 1911, Pope.

No. 1,030,654, June 25, 1912, Elliott (application filed March 13, 1902).

No. 1,072,986, September 9, 1913, Pope (application filed January 12, 1911).

While the actual number of shoes operated upon by the model B heeling machine and the Lightning heeler vary somewhat, as is the case with nearly all shoe machines, according to the skill of the operator and according to the number of hours that he works in a day, a fair estimate of the comparative outputs of the two machines

is that when the Lightning heeler and the model B machine are run under the same conditions and by the same operator, the model B machine will show an average capacity exceeding that of the Lightning heeler by over twenty per cent.

Nailing Machine: Alpha Wood Heel.

Another machine supplied by the United Shoe Machinery Company for attaching is the machine known officially as "Nailing Machine, Alpha Wood Heel", which was first put out in 1907 in response to a limited demand from shoe manufacturers for a machine to attach wooden heels. Before the introduction of this machine wooden heels had always been attached by hand. The machine is not shown in any patent which has as yet been granted, but is shown in the drawings and described in the claims of a pending application filed August 1, 1907.

All of the heeling machines which have been discussed, loading and attaching machine, McKay automatic heel, nailing machine, American Lightning, loading and attaching machine, McKay automatic heel, model B, and nailing machine, alpha wood heel, are put out by the United Company through its heeling department.

Slugging Machine: Universal.

Subsequently to the securing of heels by the insertion of the heel-attaching nails it is the general practice to perform another fastening inserting operation upon the heel of the shoe. This is the operation known as "slugging". Slugs are short fastenings, usually of metal, which are driven through the toplift, that is, the outer lift of the heel, and through one or two of the heel lifts adjacent to the toplift. The utility of these slugs is to assist in holding the toplift to the body of the heel and to add to the wear-resisting qualities of the heel, particularly the toplift. Slugs are also ornamental and, accordingly, are frequently arbitrarily shaped to increase the ornamental effect. The standard commercial machine offered to manufacturers by the United Shoe Machinery Company for performing this slugging operation is known as "Slugging Machine, Universal".

Defendants' Exhibits numbered 13, 109, 110 and 121 are provided with heels which have been operated upon by the Universal slugging machine, and which illustrate some of the different ways in which it is the practice to arrange these slugs.

The machine as it is now constructed and supplied to manufacturers is described in the claims of the following patents: —

No. 582,579, May 11, 1897, Cutter.

No. 582,580, May 11, 1897, Cutter.

No. 765,650, July 19, 1904, Casgrain.

No. 786,190, March 28, 1905, Casgrain.

No. 1,017,381, February 13, 1912, Casgrain.

No. 1,040,273, October 8, 1912, Casgrain.

In addition to the patents on the above list which set forth mechanisms which are now, and have been for a number of years, incorporated in all the machines, the machine is especially equipped with various improvements adapting it for special kinds of work which, together with the patents directed to these improvements, will be discussed later.

The commercial machine is constructed substantially as shown in patent No. 786,190, March 28, 1905, Casgrain.

Referring now to such of the patents on the above list as set forth the more striking characteristics of the organization of the Universal slugging machine, typical claims of patent No. 582,579, May 11, 1897, are 23 and 24:—

"23. In a nailing machine, a stock support, a starting and stopping mechanism, a driving shaft, mechanism operated by said shaft to periodically depress said support to permit the feeding of the stock, and independent means controlled by said starting and stopping mechanism to finally depress the horn when the machine is stopped, for the purpose set forth.

"24. In a nailing machine, a stock support, a starting and stopping mechanism, a driving shaft, connecting mechanism between said support and shaft to periodically depress said support to allow the feeding of the stock, a mechanism connected to the starting and stopping mechanism independent of the nail driving mechanism, operating on said support and governed by the starting and stopping mechanism of the machine respectively to raise and lower said support when the machine is started or stopped, and a device controlling said independent mechanism and preventing its opera-

tion on said support until such time as will insure the complete operation of the machine, for the purpose set forth."

The object of the mechanism defined in the claims above quoted is to relieve the operator of the burden of frequently depressing the work-support treadle to permit frequent changes in the location of the work upon the work support. Such depression of the horn, to permit change in the work, is frequently required several times during the slugging operation upon most heels.

Furthermore, this mechanism gives a final depression to the work support when the machine stops, without the necessity of the operation of the work-support treadle against its very strong spring, which must be strong enough to sustain the shoe against the blow of the driver in the slug-inserting operation. It is believed that a slugging machine would not be acceptable to manufacturers, and particularly to operators, which did not embody the improvements set forth in the claims above quoted from patent No. 582,579, and which is also defined in claim 1 of patent No. 582,580, which is as follows: —

"1. A stock support movable up and down, a driving shaft, a cam on said shaft driven thereby, and connections between said cam and stock support operated by said cam, whereby the support is automatically raised by the first movement of the driving shaft when the machine is started and held in its raised position until the machine is stopped, for the purpose set forth."

As already stated, the commercial machine is constructed substantially as shown in patent No. 786,190, March 28, 1905, Casgrain, of which typical claims are the first and the sixth: —

"1. In a machine of the class described, a main shaft, mechanism for inserting fastenings, a clutch and a brake, means governed by rotation of said shaft to effect release of the clutch, operating devices actuated from the main shaft and arranged to derive their final movement from the main shaft after release of the clutch, whereby the momentum of said shaft is taken up and utilized prior to application of the brake, and means to maintain the brake in inoperative position until after such utilization of the momentum to prevent shock as the machine is stopped."

"6. In a nailing machine, a horn, a main shaft, means, including a governing member, operated by said shaft, to periodically depress the horn for feeding the work, and a device between said shaft and

said governing member, to give to the latter an additional movement and thereby impart to the said horn a final depression when the machine is stopped."

The first successful mechanism ever used in the shoe industry for holding and delivering wire for the operation of machines for inserting slugs, or any type of metallic fastening, is shown in the drawings substantially as used in this machine and set forth in all of the nine claims of patent No. 765,650, July 19, 1904. A typical claim of this patent is the first: —

"1. In a device of the class described, a support, having a bearing, and a reel, adapted to receive a coil of wire or like material, suspended at its upper part from said bearing, and being out of contact with said support or bearing except at the upper part of the reel, said reel being arranged to rotate freely upon the bearing in substantially a horizontal plane as said material is drawn off, whereby twisting of the material is avoided."

It may be of interest, as bearing upon the importance of the mechanism set forth in this patent No. 765,650 to note that the mechanisms set forth in all of the nine claims of this patent have been embodied in machines made by the Duplessis Shoe Machinery Company and in several different types of machines, including the slugging machines, which were built by Thomas G. Plant.

When the Universal slugging machine is used for slugging the heels of welt shoes, it is provided with improvements defined in nearly all of the twenty-seven claims of patent No. 919,424, April 27, 1909, Cuff. A typical claim of this patent is the second: —

"2. The combination with a sustaining bed, of a jack spindle having a tipping movement in one direction and provided with a foot having a curved under side resting on said bed upon which the spindle may rock in another direction, the contour of said curve being such that the upper end of the spindle will move in a substantially horizontal plane during the normal operative movement of the spindle."

A typical claim of patent No. 1,017,381, February 13, 1912, Casgrain, several claims of which define improvements embodied in the Universal slugging machine, is the seventh: —

"7. In an apparatus of the class described, wire feeding devices, an elongated fixed guide below them, a fixed and a movable cutter,

to sever the wire, a bodily movable guide for the wire located adjacent to cutters, and a sliding support on which the movable cutter is mounted, said guide moving with the wire when the latter is engaged by the cutters to relieve the strain upon the latter."

The gauge for performing the important function of causing proper location of the slugs in relation to the edge of the toplift is as embodied in the commercial machine set forth in all of the eleven claims of patent No. 1,040,273, October 8, 1912, Casgrain. A typical claim is the first: —

"1. A two way gauge comprising, in combination, a gauge slide, excentric means through which said slide may be moved to and fro longitudinally between limits determined by the excentricity of said means, and means for determining other limits between which said slide may be freely moved, comprising co-operating stops one of which is fixed and the other of which is adjustable about the axis of turning of said excentric means into different angular relations to said means to determine different limits for the effective free movement of said means."

When the Universal slugging machine is used for slugging spring heeled shoes it is provided alternatively with a work-supporting mechanism shown and set forth in the claims of patent No. 609,874, August 30, 1898, Casgrain, or No. 705,512, July 22, 1902, Casgrain.

This machine is put out by the United Shoe Machinery Company through its metallic department.

Slugging Machine: No. 5 (Ziz).

Since 1900 the United Shoe Machinery Company has carried on experimenting, which has been practically continuous, in the effort to produce an entirely new slugging machine which would have a greater capacity than the Universal slugging machine, and since the organization of the company no less than seven different experimental machines have been constructed in the course of this experimenting. The experimental work upon the most promising of these machines began in 1902, and has been continuously carried on since then and is still going on. In the course of this experimental work there was built an experimental machine substantially as shown in patent No. 1,012,811, December 26, 1911, Casgrain,

and a machine substantially as shown in that patent was tried out in a shoe factory in February, 1905. A second experimental machine on similar lines, which was constructed substantially as shown in patent No. 1,054,173, February 25, 1913, Casgrain, was built and was tried out in a shoe factory for several months early in 1907. It is found that this machine, while it operated satisfactorily under the eyes of one of the company's experts, could not be depended upon to operate with commercial success under usual factory conditions and when operated by the average operator. It was decided, therefore, that this experimental machine was not even an approximation of a commercial machine, and after it had been used experimentally for a few months it was sent back to the company's factory for further experimental work. As a result, late in that year, 1907, another experimental machine was put into a shoe factory for a trial under commercial conditions. This machine proved sufficiently promising during its experimental use, so that after some months of this trying out under commercial conditions it was decided to build a number of additional machines in order that the machine might be tried out in a number of different factories on different classes of work. Accordingly, fourteen of those machines were constructed and were put out from 1909 to 1913. The company's experts were at that time very optimistic as to the future of this machine, because although the machine was giving considerable trouble from time to time, that is only the usual experience at such a stage of the development of an entirely new machine, and it was confidently believed that the difficulties being encountered in the use of the machine could all be overcome in time. Those fourteen machines were run regularly at an average speed of about 700 slugs per minute as compared with a maximum commercial speed of 375 for the Universal slugging machine, and the new machine had been run at the company's factory at a speed of 1500 slugs per minute.

The problems which had been encountered in the use of the experimental machines were not overcome as anticipated, and, although the machine has been for several years almost within sight of commercial success, the company's experts and inventors have

not yet been able to get the organization of the machine into such condition that the machine could be satisfactorily used by the average operator under commercial conditions. Whether or not the machine will ever become commercially successful is still problematical. Considerably over $100,000 has been spent already in the experimental work upon this machine. The patents which set forth in their claims the organization of this machine in its present form, and as it is now being operated under commercial shoe factory conditions, are as follows: —

No. 582,579, May 11, 1897, Cutter.

No. 582,580, May 11, 1897, Cutter.

No. 601,255, March 29, 1898, Horton.

Reissue 11,962, January 21, 1902, Freeman (original patent January 24, 1899).

Reissue 12,820, June 23, 1908, Preston (original patent May 15, 1906).

Reissue 12,821, June 30, 1908, Preston (original patent June 5, 1906).

No. 691,354, January 21, 1902, Casgrain.

No. 714,572, November 25, 1902, Freeman.

No. 809,160, January 2, 1906, Wingo.

No. 978,297, December 13, 1910, Keith.

No. 998,043, June 27, 1911, Ambler.

No. 1,000,490, August 15, 1911, Buckminster.

No. 1,001,815, August 29, 1911, Casgrain.

No. 1,002,864, September 12, 1911, Perry.

No. 1,004,240, September 26, 1911, Casgrain.

No. 1,005,920, October 17, 1911, Ambler.

No. 1,006,533, October 24, 1911, Casgrain.

No. 1,012,811, December 26, 1911, Casgrain (application filed February 16, 1906).

No. 1,030,829, June 25, 1912, Preston (application filed August 3, 1905).

No. 1,053,479, February 18, 1913, Casgrain (application filed September 12, 1908).

This machine is of a radically different type from any machine

for inserting fastenings or slugs ever before used. The character of the organization of the machine may be indicated by quoting typical claims from reissue patent No. 12,821 and patent No. 1,053,479, both of which are enumerated in the above list. Claim 19 of reissue 12,821 is as follows:—

"19. A machine of the character described comprising, in combination with a work support, a movable carrier and a pair of opposed severing jaws mounted thereon and adapted to move simultaneously towards a strip of fastening material located between them, means for presenting said strip in a predetermined line of drive, and means for actuating said carrier and jaws to cause the latter to grip said strip, drive it into the work and completely sever said strip immediately at the end of the driving operation to form a fastening."

The third claim of patent No. 1,053,479, which contains 183 claims setting forth mechanisms embodied in this machine, is as follows:—

"3. In a machine for inserting fastenings, the combination with a pair of cutters constructed and arranged to grip a strip of fastening material, insert the end thereof into a piece of work and sever a portion of said strip to form a fastening, of means for controlling positively and continuously the operations of said cutters."

Without attempting to discuss in detail any of the mechanisms set forth in others of the patents enumerated on the above list, attention should be called to one feature of the organization of this machine which is of striking novelty and which will undoubtedly be incorporated in any high-speed slugging machine which the company may develop. This consists in means for automatically stopping the insertion of the slug at the proper point adjacent to the breast of the heel. Unlike the operation of most fastening inserting machines it is of great importance that the line of slugs shall terminate at the proper point in relation to the breast of the heel as the slugs are prominent in the finished shoe. At such speed as that at which this experimental machine has regularly been run, it probably would be impossible for the operator to stop the machine within one or two slugs of the proper stopping point. Accordingly the experimental machine has been provided with an automatic organization for stopping the machine at exactly the proper point

in its operation. This organization is defined in the claims of patent No. 1,006,533, October 24, 1911, Casgrain, and patent No. 1,053,-479, February 18, 1913, Casgrain. A typical claim directed to this organization is claim 142 of patent No. 1,053,479, which is as follows:—

"142. In a machine for inserting fastenings, the combination with fastening inserting mechanism and a source of fastening supply, of automatic means governed by the contour of the work for causing the insertion of fastenings to be discontinued at a predetermined distance from the end of the work."

In view of the doubt as to the ultimate commercial success of the experimental machine which I have been discussing, which has been known successively as the "Ziz Slugging Machine" and as the "Slugging Machine No. 5", the company has for some time had inventors engaged in experimental work with a view to the production of a new machine on entirely different lines from that of the Universal slugging machine or of the slugging machine No. 5. This experimental work is being carried on on two different lines, with the object of producing two differently organized machines which will be tried out together under commercial conditions with a view to the selection and commercial adoption of the machine which proves most satisfactory.

Heel Breasting Machines.

A further operation which must be performed upon the heel before the work upon this part of the shoe is completed is the operation known as "heel breasting". The function of a heel-breasting machine is to remove from the forward end of the heel the surplus stock and form a smooth front or breast face on the front end of the heel. The operation is usually performed by a knife acting in a direction approximately perpendicular to the shank portion of the sole and cutting from the tread face of the toplift to the shank.

Prior to February, 1899, all heel breasting was done by foot-power machines, several types of which were supplied to manufacturers. These machines comprise, generally speaking, a knife and a shoe support which are moved relatively to each other by a

foot treadle, all the power required for forcing the knife through the successive layers of stock in the heel being applied by the operator through the treadle. The operation of this machine was a great tax upon the operator's strength, and prior to the formation of the United Shoe Machinery Company attempts had been made to develop a power-operated machine which should relieve the operator of the arduous task of operating the knife by his foot. The reason why the industry had waited so long for a power-operated heel-breasting machine is that all heels vary in height, even the heels of shoes which are intended to be substantially alike, and the breasting cut must, on the one hand, extend entirely to the shank of the shoe so as to sever completely the surplus stock which is to be removed, while on the other hand it is equally important that the knife shall not cut further than the shank of the sole and deface the sole by cutting into the shank.

No power-operated commercial machine had ever been devised until a machine was produced by the United Shoe Machinery Company which could deal successfully with the problem of cutting just far enough to sever completely the surplus stock and, at the same time, not cut far enough to deface the shank of the sole. Just prior to February, 1899, the McKay Shoe Machinery Company had been carrying on experimental work on a power-operated heel-breasting machine. This experimental work was carried on continuously by the United Company from the time of its formation until a successful commercial machine was produced. During 1900 and 1901 some fifty experimental machines were constructed and were put out into shoe factories, but none of the machines was commercially successful and none of them was operated at all after a few months' trial. Eventually all of these fifty machines were returned to the company's factory and were junked.

HEEL BREASTING MACHINE — MODEL B: POWER.
HEEL BREASTING MACHINE — MODEL B: IMPERIAL.

The difficulty with which the United Company's inventors were struggling was the problem of providing a mechanism which would be satisfactory for a shoe machine and for operation by the aver-

age shoe factory workman, which, at the same time, would be sufficiently delicate in its operation to suspend the operation of the power mechanism for operating the knife at just the right time to stop the knife as it reached the shank of the shoe and after it had traveled far enough to sever the surplus stock completely. In 1902 the machine was entirely redesigned and then became commercially successful for the first time. The redesigned machine was named "Heel Breasting Machine, Model B, Power". As it was then constructed the machine embodied mechanism set forth in the claims of patent No. 636,990, November 14, 1899, Heys, and No. 645,994, March 27, 1900, Brewer. Patent No. 636,990 defined broadly the principle of operation of the machine. Typical claims of this patent are the first and fourteenth: —

"1. A heel breasting machine comprising a shoe support, a knife, mechanism for forcing the knife positively or unyieldingly through the heel to the sole, and mechanism for automatically checking the movement of the knife when it has cut through the heel."

"14. A heel breasting machine comprising a shoe support, a movable knife, and mechanism for automatically driving said knife through a heel of any height to the sole, said mechanism including a bunter for limiting the movement of the knife, said bunter being arranged to engage the sole with a pressure less than that with which the knife engages the heel."

A typical claim of patent No. 645,994 is the fourth: —

"4. A heel breasting machine comprising a work support, a carrier positively reciprocated toward and from the support, a knife holder located between the carrier and support and having a breasting knife, a toggle connecting carrier and knife holder, an adjustable stock on the knife holder adapted to support toggle against a braking movement in one direction, and automatic means for imparting the braking movement in the opposite direction to said toggle."

The machine was greatly improved in 1903 when the mechanism for arresting the movement of the knife when it reached the shank of the shoe was recognized. This improvement is set forth in the claims of reissue No. 13,413, April 30, 1912, Waterman (original patent No. 738,502, September 8, 1903).

With the incorporation in it of the improvements set forth in

this Waterman reissue patent the machine became immediately successful and 229 machines were put out during the company's fiscal year ending March 1, 1904. A typical claim of reissue No. 13,413 is the twentieth: —

"20. A heel breasting machine, having, in combination, an actuator having a constant stroke, a knife carrier arranged for movement parallel therewith, rotatable means mounted upon said carrier on an axis transverse to the direction of movement of the carrier and arranged in the part of a portion of said actuator for movement of the carrier by the actuator, said means being constructed and arranged to clear said other part when permitted to rotate, means normally restraining said rotatable means from rotation, and shoe engaging means carried by the carrier arranged to release said rotatable means when the motion of said shoe engaging means is stopped."

About January, 1906, the name of this machine was changed to "Heel Breasting Machine, Model B, Imperial."

To meet peculiar conditions in the Philadelphia territory and to supply a demand from manufacturers in that territory for a machine for breasting small shoes on lasts which varied greatly in height, a reorganized machine was constructed and supplied to those manufacturers in 1908, and since that time, which is constructed as shown in the drawings and set forth in all of the twenty-four claims of patent No. 1,068,423, July 29, 1913, Frasier (original application filed October 20, 1908). Typical claims of this patent are the third and sixteenth: —

"3. A heel breasting machine having, in combination, a reciprocating breasting knife arranged to be driven the same distance at each stroke, a support for sustaining a shoe with its heel in the path of the breasting knife arranged for movement manually in the line of motion of the knife, and a stop constructed for adjustment to definite distances from the limit of movement of the knife and arranged to be engaged by the tread surface of the heel to limit movement of the shoe toward the knife, the said stop being stationary during the cutting stroke of the knife."

"16. In a machine of the class described, a knife having a definite lower limit of movement manually, means adjacent the shoe for positively elevating the shoe to bring the tread surface of its heel to a predetermined distance from said limit, and means engaging the heel to receive the thrust of said elevating means."

An organization of this machine which enables it to breast spring heels is set forth in all of the ten claims of patent No. 1,023,284, April 16, 1912, Warren (application filed July 8, 1911). Without taking time to quote a claim, I will state that the fourth claim is typical.

To adapt the machine for peculiar conditions attending its operation upon extremely crooked lasts, an improvement was adopted in 1910 which is set forth in the claims of a pending application.

The method which is practiced in the making of the peculiarly shaped knives for use upon this power heel-breasting machine is defined in the claims of a pending application.

On October 1, 1913, over 1600 of these machines had been put out by the United Company through its general department. The capacity of the machine is from 1500 to 2500 pairs per day, according to the class of work.

Mr. WEBSTER. Please note the petitioner's objection to the foregoing answer, especially to all testimony or statements therein relating to patents issued since the filing of the petition herein; to all testimony relating to pending applications for patents or to constructions shown in pending applications; to all statements of the witness as to what others said, thought, or did; to all reference to experimental machines, to all expressions of opinion of the witness, to all that portion of the answer as is argumentative, and to all testimony before the Special Examiner not in defence of the evidence introduced by the petitioner before the examiner; all said objections being on the ground that all such testimony and evidence is incompetent, irrelevant and inadmissible and as having no bearing on the issues involved in this cause, and especially as having no reference to the matters referred to in the order for taking testimony before the Special Examiner. And notice is hereby given that counsel for the petitioner will hereafter file a motion to strike such testimony and evidence from the records, which motion will specifically point out the matters objected to.

Int. 81. Have you collected under one or more covers the several patents referred to by you in your answer to the last question,

as relating to machines for manufacturing and attaching heels to boots and shoes?

Ans. Yes, sir; and I produce a collection of the patents referred to in the portion of my testimony relating to heel-compressing machines.

[*Volume of patents relating to heel-compressing machines is offered in evidence, and marked "Defendants' Exhibit 162".*]

Mr. WEBSTER. Please note petitioner's objection to the introduction of patents dated after the filing of the petition herein as incompetent, inadmissible and irrelevant and having no bearing on the questions involved in this cause, and especially as having no bearing on the matters submitted before the examiner.

[*Answer to Int. 81 continued:*]

I also produce a collection of patents referred to in the portion of my testimony relating to loose-nailing machines.

[*Volume of patents referring to loose-nailing machines is introduced in evidence, and marked "Defendants' Exhibit 163".*]

[*Answer to Int. 81 continued:*]

I also produce a collection of the patents referred to in that portion of my testimony which dealt with heel-attaching machines.

[*Volume of patents referring to heel-attaching machines is introduced in evidence, and marked "Defendants' Exhibit 164".*]

[*Answer to Int. 81 continued:*]

I produce also a collection of the patents named in the portion of my testimony relating to slugging machines.

[*Volume of patents relating to slugging machines is introduced in evidence, and marked "Defendants' Exhibit 165".*]

[*Answer to Int. 81 continued:*]

I also produce a collection of the patents referred to in the portion of my testimony relating to heel-breasting machines.

[*Volume of patents relating to heel-breasting machines is introduced in evidence, and marked "Defendants' Exhibit 166".*]

Int. 82. Will you please give the number, date and name of the patentee of the several patents referred to in the volume of patents just offered in evidence as Defendants' Exhibits 162, 163, 164, 165 and 166?

Int. 83. What is the function of the insole as a part of the organization of a boot or shoe, and what is meant by a "reinforced" insole?

Mr. WEBSTER. In view of the fact that no testimony in reference to insoles was introduced by the petitioner before the examiner, counsel for petitioner objects to the question as calling for matter not admissible at this stage of the proceedings.

Ans. The insole is that part of the shoe to which, in the lasting operation, the upper is secured during the shaping of the upper to the last. In a later stage of the manufacture of the shoe the out-sole is secured to the insole, either directly by stitching the out-sole to the insole, as in a McKay sewed shoe, or securing it by pegs or metallic fastenings, as in a pegged or nailed shoe, or indirectly through the welt, as in a welt shoe.

An insole for a McKay shoe requires no preparation other than giving it a shape corresponding with the shape of the bottom of the last. This is because the out-sole of a McKay sewed shoe is attached directly to the insole by a through-and-through stitch. Owing to this fact that the out-sole of a McKay sewed shoe is secured by a stitch passing entirely through the insole, the insole for the McKay sewed shoe requires no preparation to enable it to receive the stitch, and it may be of comparatively cheap and thin stock and still afford ample holding power for the chain stitch seam which secures the out-sole to the insole. In the welt shoe, on the other hand, the out-sole is secured to a welt, this being the only means of attachment of the out-sole to the shoe. The welt must previously, together with the upper, be sewed to the insole and in attaching the welt and the upper to the insole the line of stitching cannot pass through the insole, and the stitch depends for its holding power upon a narrow portion of stock on the flesh side of the insole which is known as the "between substance". In an all-leather insole this "between substance" is the narrow strip of stock between a lip which is formed on the outer edge of the insole by a cut approximately parallel with the face of the flesh side, and another cut made in the flesh side of the stock from a line somewhat removed from the edge, which cut is directed outwardly toward the edge of the sole. A "reinforced" insole is an insole which has had applied to its flesh side a piece of reinforcing fabric, usually canvas. In preparation for the application of the fabric a

lip or lips on the flesh side of the insole are turned up into a position approximately perpendicular to the flesh side of the sole, and the reinforcing fabric is applied while the lip or lips occupy this approximately perpendicular position.

Int. 84. What type of reinforced insole was in most extensive practical use in 1899, and what machines were put out for making such insoles? What development has been made in the reinforced insole art since 1899, and in machines for making reinforced insoles? If the insoles are the subjects-matter of patents of the United Shoe Machinery Company, state the patents; and if the machines embody mechanisms shown and described in Letters Patent of the United Shoe Machinery Company, state the patents.

Mr. WEBSTER. The same objection repeated.

GEM INSOLE.

Ans. Shortly before 1889 there was being used commercially a reinforced insole known as a "Gem" insole. This was the first successful insole of this character devised for the purpose of providing an insole which would be as satisfactory in the manufacture and wear of a shoe, or even more satisfactory, than an all-leather insole, which, owing to the requirements which I indicated in the preceding answer, had to be made of expensive leather of good quality. It was found that by forming a lip by cutting into the edge of the sole a short distance and turning up the lip thus formed, and then applying reinforcing material to the entire flesh side of the insole, the reinforcing material over the lip upturned from the flesh side of the leather blank, an insole could be produced which would be less expensive than a leather insole, which could be used for the same class of work, and would, in fact, be more satisfactory in the wear of the shoe. An insole of this type was known as the "Gem" insole, which was first used in 1898. This insole as commercially used in 1899, and as still used, is illustrated in patent No. 575,460, January 19, 1897, Cole. There were supplied to manufacturers for producing this Gem insole several machines which comprised the so-called "Gem System", to which I will briefly refer before specifically explaining the insole and several machines for producing it.

The machine for turning up and setting the lip of the leather blank is known as the "Turning Machine, Gem Lip", and the commercial machine is constructed substantially as shown in patent No. 638,010, November 28, 1899, Hadaway. That machine is now being superseded by the "Turning and Slashing Machine, Goodyear Lip", which is shown and described in a pending application.

The machine known as the "Flexible Insole Gem" is the machine which is used for applying the reinforcing canvas to the Gem insole and for shaping it to the upturned leather lip, and is shown substantially in its commercial form in patent No. 614,860, November 29, 1898, Hadaway.

Referring now more in detail to the patents owned by the United Shoe Machinery Company which relate to the Gem insole and to the machines above enumerated for making the insole, the Gem insole itself is defined in the claims of patent No. 575,460, January 19, 1897, Cole, which is as follows: —

"As an improved article of manufacture, an insole comprising a body of leather, a lip and feather formed by splitting the outer edge of the body in the usual manner, and a continuous reinforcing covering secured to the central portion of the bottom of the sole, indented over the lip, and terminating upon and secured to the bottom of the feather upon opposite sides of the sole, substantially as described."

I produce a Gem insole such as is defined in the above claim.

[*Gem insole is offered in evidence, and marked "Defendants' Exhibit 167".*]

[*Ans. to Int. 84 continued:*]

The machine for turning up the lip which is formed, as stated in the claim of patent 575,460, by "splitting the outer edge of the body in the usual manner", is known as "Turning Machine, Gem Lip", and embodies mechanisms defined in the claims of the following patents: —

No. 610,326, September 6, 1898, Keith.

No. 623,306, April 18, 1899, Coupal and Gordon.

No. 638,010, November 28, 1899, Hadaway.

Of the above patents, No. 638,010 shows in the drawings and describes in its specifications the machine substantially as con-

structed for commercial use. The improvements which are set forth in the claims of this patent are those which made the machine commercially successful. A typical claim of this patent No. 638,-010 is the first : —

"1. In a lip turning machine, the combination with a reciprocating lip setting tool, of means to so actuate said tool and to support the work so as to cause said tool to strike and act upon the lip at the base thereof within the angle formed by the lip and feather of the insole, substantially as described."

It is important that the leather lip of the insole be raised into a position substantially perpendicular to the face of the insole because, first, it must be in this position in order that the reinforcing canvas shall be applied to it properly ; and secondly, because after the canvas has been applied to the bottom of the insole it is necessary that the reinforced lip shall be perpendicular to the face of the insole in order that the upper stock may be properly lasted into the angle of union between the lip and the feather edge, that is, the portion of the stock between the shoulder formed by the lip and the extreme edge of the sole. It is further important that this angle formed by the lip and the feather edge shall be clearly defined so that the upper stock can be lasted into it properly, and later that the welt and the upper may be properly attached to the lip in the inseam-sewing operation. It was a difficult problem to raise this lip and make it stand in this substantially vertical position, owing to the tendency of the lip to turn backward toward the face of the sole. The improvemenst of this Hadaway patent No. 638,010, November 28, 1899, provided for the first time an organization for a lip-turning machine which would make this leather lip stand up permanently in the desired perpendicular position and which would sharply define the angle of union between the lip and the feather edge.

Improvements which are embodied in the commercial machine are also defined in broad terms in the four claims of patent No. 610,326, September 6, 1908, Keith, of which typical claims are the first and third : —

"1. In a lip turning machine, the combination with a lip turn-

ing plow and a lip setting roll located adjacent thereto, of a work support arranged to hold the work against said plow and roll, the lip setting roll being inclined relatively to the surface to the work support, substantially as described."

"3. In a lip turning machine, the combination with a lip turning plow and a lip setting roll arranged adjacent to and following the plow, of a work support rotating in a horizontal plane and a rotating feed wheel arranged to enter the angle between the feather and lip of the sole, substantially as described."

This Gem lip-turning machine also embodies improvements set forth in claim 2 of patent No. 623,306, April 18, 1899, Coupal and Gordon.

Turning and Slashing Machine: Goodyear Lip.

In the use of this Gem lip-turning machine it was found that frequently after the operation of the machine the portions of the lip which had been turned up in sharply curved shanks between the ball and the middle of the shank would not always remain in the desired perpendicular position, owing to the fact that in turning up the lip the edge of the lip had been forced into a curved line of larger radius than the curved line in which the edge of the lip had been located before it was turned up, and there was a constant tendency for the lip to return from the desired perpendicular position to its original condition. It was, accordingly, the practice of the operator, when he observed this tendency of the lip to turn back toward the body of the insole, to slash the lips at two or more points in the shank by a hand knife and relieve the strain on the lip occasioned by the stretching of its edge. With a view to producing a lip-turning machine which would perform this slashing operation, before performed by hand, the United Company, in January, 1909, started experimental work with the object of producing a reorganized machine in the operation of which the lip could be slashed whenever desired, as in the shank, while the lip-turning operation was progressing. This experimental work resulted in the production of a machine by which, as the operation of the machine was proceeding around the insole, the operator could by depressing a treadle render operative automatic mechanism for cutting a vertical slit through the lip, from the tip of the

lip to its base, thus overcoming the tendency of the lip to swing back out of vertical position by relieving the stretching strain on the top edge of the lip. This machine was developed into a commercial form and first put out for commercial use in January, 1912. It is organized to perform mechanically the operation previously performed by hand, as has been described. This machine embodies the improvements defined in the three patents already mentioned, Nos. 610,326, 623,306 and 638,010, but the reorganized machine is not shown in its commercial form in any granted patent, but is shown in drawings described in the specification and set forth in the claims of a pending application filed on March 3, 1911.

FLEXIBLE INSOLE MACHINE: GEM.

The machine of the Gem system which applies the reinforcing material to the insole, which is known as the "Flexible Insole Machine, Gem", embodies mechanism set forth in the claims of the following patents:—

No. 603,763, May 10, 1898, Hadaway.

No. 609,103, August 16, 1898, Keith.

No. 609,110, August 16, 1898, Milner.

No. 614,860, November 29, 1898, Hadaway.

The commercial machine is constructed substantially as shown in the drawings of patent No. 614,860.

In the manufacture of the Gem insole, after the lip has been turned up by the Gem lip-turning machine an oblong strip of canvas previously cemented is roughly applied by hand to the flesh side of the insole, that is, the side on which the lip has been formed, and this oblong strip is necessarily of such size that there is more or less excess canvas extending beyond the margin of the insole all around the insole except at the heel end, which does not need reinforcing since the inseam by which the welt and upper are secured to the insole terminates on each side at a point located approximately at the forward or breast end of the heel in the finished shoe. The general object of the reinforcing machine is to crimp the canvas so that it will fit closely over the lip of the leather blank, and particularly so that it shall fit in the angles formed on

both sides of the lip at the junction of the lip and the body of the insole on the inside and the feather edge on the outside.

The machine shown in patent No. 603,763, May 10, 1898, Hadaway, was the first machine ever devised for reinforcing insoles, but the machine was a satisfactory commercial machine and was not put into commercial use. This patent, however, represents an important step in the development of the commercial machine and sets forth broadly in its claims mechanism which was embodied in the commercial machine. Typical claims of this patent No. 603,763, directed to the organization of the commercial machine, are 16, 18 and 21, which are as follows:—

"16. In a machine for applying reinforcing material to insoles, the combination with a work support, of bead forming tools and mechanisms to actuate said tools to cause them to form a bead or crimp in said reinforcing material, substantially as described."

"18. In a machine for applying reinforcing material to insoles, the combination with bead forming mechanism for forming the bead or crimp in the reinforcing material, of edge trimming mechanism for trimming the edge of said reinforcing material, substantially as described."

"21. In a machine for applying reinforcing material to insoles, mechanism operating automatically to form a bead or crimp in said reinforcing material, and to secure said reinforcing material to an insole, substantially as described."

One of the difficulties in the production of a commercially satisfactory machine for applying reinforcing material to an insole was due to the tendency of the cemented canvas to stick to the upper edge of the lip of the insole after it had been roughly applied by hand, as has been explained, and prior to and during the reinforcing operation. One of the important features of this reinforcing machine was the means incorporated in it for lifting the cemented canvas away from the lip just before and during the operation of the crimping means. The importance of this means for freeing the cemented canvas from the edge of the lip may be understood if it be explained that it is essential that the reinforcing material be forced properly into the angle on the inside of the lip formed between the lip and the bottom of the insole, and that it is also desirable that the reinforcing material be likewise crowded down

into the angle on the outside of the lip between the lip and the feather edge, and it would be practically impossible to get the reinforcing material properly into either of these angles unless the cemented canvas were freed from the upper edge of the lip, as otherwise, when the canvas was crimped into the angle on the inside of the lip it would pull the lip over with it, making it impossible to get the canvas properly into the inside angle and also impossible to complete the reinforcing operation by getting canvas properly into the angle on the outside of the lip. This problem was solved by the incorporation in the organization of the reinforcing machine, of the means to which I have referred for raising the canvas out of contact with the edge of the lip just before and during the crimping operation. This means, which is termed in the claims of the patent an "anvil or former", is defined in broad terms in seven claims of patent No. 603,763, May 10, 1898, Hadaway. Claim 26 is typical: —

"26. In a machine for applying reinforcing material to insoles, the combination with a beading or crimping tool of an anvil or former having a bead molding head projected therefrom, substantially as described."

All of the twelve claims of patent No. 614,860, November 29, 1898, Hadaway, define mechanisms embodied in the commercial machine. Among other improvements this patent defines an improved construction of under-forming mechanism which I have just discussed and which is defined broadly in the claim above quoted. This improved under-former of the commercial machine is set forth in a number of claims of this patent, of which a typical claim is the fifth: —

"5. In a machine for reinforcing insoles, the combination with a bead forming tool, of a former or anvil, and means to impart a vertical movement to the former or anvil toward and away from the working end of said tool, substantially as described."

This patent No. 614,860 also sets forth in its claims an improved organization of the tools which co-operate in the beading or crimping of the reinforcing material about the lip of the leather blank. Of these claims a typical claim is the first: —

"1. In a machine for reinforcing insoles, the combination with an anvil or former, of a plurality of bead forming tools, one of said tools being a fixed tool and another of said tools being movable toward and from the fixed tool, substantially as described."

The experimental machine shown in the drawings of patent No. 603,763, May 10, 1898, Hadaway, was provided with means for severing excess canvas projecting beyond the edge of the insole which comprised a fixed cutter and a reciprocating cutter co-operating with the fixed cutter. This combination would not cut the canvas cleanly enough and was also arranged to trim the canvas before it had been attached to the insole, so that the line of cutting could not be depended upon to follow the edge of the insole after the fabric had been secured to the feather edge. This organization was substantially improved by the mechanism shown in patent No. 609,103, August 16, 1898, Keith. This improved construction comprised overlapped rotary cutters, rotating in a vertical plane, which severed the excess canvas after the canvas had been cemented to the feather edge, and which also were organized to be held yieldingly against the edge of the insole so that they would operate to trim the excess exactly at the edge of the insole, as is desired.

This improvement is defined in the seventh and thirteenth claims of patent No. 609,103, which are as follows: —

"7. A machine of the character specified, comprising means for pressing a sole rib, sole feeding mechanism, and a yieldingly supported trimming mechanism movable toward and from the edge of the sole to conform automatically to the edge of the sole."

"13. In a machine for reinforcing insoles, the combination with a work support arranged to support the insole, of means to conform the reinforcing material to the insole and cutters movable toward and from the edge of the insole arranged to automatically follow the edge of the insole and trim the edge of the reinforcing material, substantially as described."

The commercial construction of this canvas-severing mechanism is shown in the drawings and set forth in the claim No. 11 of patent No. 614,860.

The importance of the improvements shown in the drawings and set forth in the claims of patent No. 614,860, November 29, 1898, Hadaway, may be judged from the fact that while the experimental

2489

machine of patent No. 603,763 had a capacity of 500 insoles per day, the machine of patent No. 614,860 had an average capacity of 1200 insoles per day.

The saving effected in the use of Gem insoles of the best quality over the all-leather insole which the manufacturer would otherwise use for the grade of work in which the best Gem insole is used, is from one-half a cent to three cents per pair, the variation depending largely upon the cost of the leather base which is reinforced. A manufacturer will often reinforce a leather insole which is almost, but not quite, good enough for use without the reinforcing, or he may reinforce the insole in order to be certain that the insole will be satisfactory in the finished shoe. In such case the minimum saving will be shown; while in case he uses a leather base made of split leather, such as is more generally used for Gem insoles, and which, when reinforced, makes an entirely satisfactory insole, the maximum saving over an all-leather insole will be effected.

ECONOMY INSOLE.

While the Gem insole was used, and still is used, to a large extent, it was open to the objection that the base of the reinforced lip on the inside of the lip is in a different plane and is higher than the base of the lip on the feather edge or outside of the lip. This difference in the height of the stock on the inside and outside of the lip of the Gem insole sometimes occasioned difficulty in its use, owing to the fact that the needle of the welt-sewing machine entering the stock at the base of the lip adjacent to to the feather edge did not always emerge from the stock at the base of the lip on the inside as it should, but penetrated further into the body of the insole and emerged from the insole at a point removed from the lip. In attempting to remedy this difficulty there was danger that the needle would enter the lip too high on the outside so that the thread would not have sufficient support in the stock, and, further, that the upper and welt would not be forced down properly into the angle between the lip and the feather edge, as is required for good welt-sewing operation. To overcome these objections to the Gem insole the United Company's inventors produced an insole

now known as the "Economy Insole", which was made substantially as shown in patent No. 849,245, April 2, 1907, except that as commercially made now the two lips shown in that patent are stitched together instead of being cemented, which is stated in the patent to be the preferred manner of forming the insole.

The distinguishing characteristic of the Economy insole as compared with the Gem, is that while in the Gem insole there is a single lip turned up from the outside with reinforcing canvas covering the entire lip face of the insole clear to the edge, as has been fully explained, in the Economy insole there are two lips turned up from the leather blank, one turned up from the outside in a similar manner as in preparing the Gem blank, and the other lip turned up from the inside by cutting a lip out of the body of the insole inside the first mentioned lip. In the manufacture of the Economy insole, after the two lips have been formed and have been secured together, as I shall explain later, the reinforcing material is applied to the body of the insole inside the lips, and to the inside of the inner lip, but does not extend over the rib formed by the two leather lips, as in the Gem insole. It is a distinct advantage of the Economy insole over the Gem that, owing to the additional strength afforded by the two leather lips, it is not necessary to carry the reinforcing material over the top of the lip and down upon the feather edge. The saving in canvas thus effected amounts to about four cents per dozen pairs of insoles.

Reinforcing Machine: Economy Insole.

Early in 1902 the United Company began experimental work in the development of machines for making Economy insoles. An important machine of the system for manufacturing these insoles is "Reinforcing Machine, Economy Insole", which was first put out commercially by the United Company in May, 1905. The commercial machine is constructed substantially as shown in the drawings and set forth in the claims of patent No. 979,836, December 27, 1910, Eppler (granted on an application filed February 24, 1905). The reinforcing of an Economy insole presented different problems from those which had to be dealt with in the reinforcing of

a Gem insole, on account of the inner lip, which, as already stated, is cut out from the body of the insole on the inside of the outer lip. It is, accordingly, necessary to force the reinforcing material down into the angle between the inner lip and the adjacent portion of the insole which is below the plane in which the body of the insole lies. Another difference in the requirements for this machine was that the excess canvas must be trimmed off at the top edge of the rib formed by the two lips instead of at the edge of the insole, as in making the Gem insole. These problems were solved by the organization of the patent just referred to, No. 979,836, and their solution is indicated by typical claims of that patent: —

"2. An insole reinforcing machine, having, in combination, a work support, a pressing device, and means for moving the pressing device downward to engage the reinforcing material on the insole and then move inward and farther downward so as to draw the material into the channel and press it against the lip, substantially as described."

"7. An insole reinforcing machine, having, in combination, provision for supporting an insole and for feeding it through the machine, a guide roll bearing at its periphery against the outer side of the lip of the insole and a rotating flat knife for trimming the edge of the lip, substantially as described."

Stitching Machine: Economy Insole.

It was originally intended to secure together the two lips raised from the insole blank prior to the reinforcing operation by cement, as indicated in the specification of patent No. 849,245, April 2, 1907, Johnson. Experimental work was carried on for several years in the endeavor to devise means which could be satisfactorily used for securing the two lips together by cement, but the company's inventor did not succeed in producing a practical machine for that purpose. Accordingly, after considerable experimenting, a successful machine for stitching together the two lips turned up from the leather blank was produced, which is known as "Stitching Machine, Economy Insole". The organization of this machine in its commercial form comprises means for turning up the lips from the body of the insole, acting progressively upon successive portions of the lip just prior to the stitching operation, means

for clamping the lips together, means for exerting pressure upon the body of the insole on the grain side opposite to the point where the stitching is taking place, to maintain the lips in proper relation to the stitching mechanism, and the means for making the stitch. No patent has as yet been granted upon this machine for sewing together the lips of the leather blank, but its organization is shown and described in applications filed May 14, 1908, January 25, 1909, and in two applications filed January 14, 1910.

I produce an Economy insole which was formed by the machines which I have just been describing.

[*Economy insole is introduced in evidence, and marked "Defendants' Exhibit 168".*]

[*Answer to Int. 84 continued:*]

This insole is broadly defined in two of the three claims of patent No. 849,245, April 2, 1907, Johnson, to which reference has already been made. A typical claim is the third: —

"3. An insole for use in manufacturing sewed shoes, consisting of a body portion having two lips cut therefrom and turned up and united to form a single stitch receiving lip around the shaft and forepart of the body portion of the insole, and a sheet of re-enforcing material cemented to the surface of the body portion and to the inner surface of the lip."

When the Economy insole stitching machine was adopted as a commercial machine in October, 1909, the Economy insole became for the first time a practicable commercial insole, and since that time the machines for making the insole have been put out extensively and have gone into general use.

Channeling Machine: Economy Insole.

With the reinforcing machine and the stitching machine is furnished a machine for channeling the leather insole blank to form the two lips, which is known as the "Channeling Machine, Economy Insole". The commercial machine is constructed substantially as shown in the drawings and described in the specifications of patent No. 984,773, February 21, 1911, Meyer. A typical claim of this patent is the tenth: —

"10. A channeling machine, having in combination, a rotatable

work support for supporting a flat sole, a work feeding device above the work support, actuating means for said feeding device to cause it to engage and feed the sole and means for rotating the work support intermittently in unison with the feeding movement of the work feeding device, substantially as described."

The work-supporting mechanism of the machine embodies mechanism set forth in the claims of patent No. 984,772, February 21, 1911.

All of these machines of the Gem and Economy systems — turning machine, Gem lip; turning and slashing machine, Goodyear lip; flexible insole, machine Gem; reinforcing machine, Economy insole; stitching machine, Economy insole; and channeling machine, Economy insole — are put out by the United Shoe Machinery Company through its Goodyear department. About 40 per cent of all welt insoles used at the present time are reinforced soles.

Mr. WEBSTER. The answer is objected to in so far as it relates to the mechanisms of pending applications, patents issued since the filing of the petition herein, and especially in so far as it relates to matter not in reply to, or in defence of, matter introduced before the examiner by the petitioner, as being incompetent, inadmissible and irrelevant, and having no relation to the matters involved herein.

Int. 85. Have you collected under a single cover the patents referred to by you in your answer to the last question as relating to reinforced insoles and machines for making such insoles?

Ans. Yes, sir; I have. I produce the volume.

[*Volume of patents referring to reinforced insoles and machines for making such insoles is introduced in evidence, and marked "Defendants' Exhibit 169".*]

Mr. WEBSTER. The introduction of patents relating to matters to which objection has been heretofore made is objected to as not competent, immaterial and inadmissible.

Int. 86. Will you please give the number, date and name of patentee of the several patents contained in the volume which has just been offered in evidence as Defendants' Exhibit 169?

Ans. No. 575,460, January 19, 1897, Cole.

No. 603,763, May 10, 1898, Hadaway.
No. 609,103, August 16, 1898, Keith.
No. 609,110, August 16, 1898, Milner.
No. 610,326, September 6, 1898, Keith.
No. 614,860, November 29, 1898, Hadaway.
No. 623,306, April 18, 1899, Coupal and Gordon.
No. 638,010, November 28, 1899, Hadaway.
No. 849,245, April 2, 1907, Johnson.
No. 979,836, December 27, 1910, Eppler.
No. 984,772, February 21, 1911, Meyer.
No. 984,773, February 21, 1911, Meyer.

WELT BEATING MACHINES.

Int. 87. In the list of machines given by you in your prior testimony [question No. 7] you referred to a machine, "Beating and Slashing Machine, Goodyear Welt", as being put out in November, 1904, by the United Shoe Machinery Company through its Goodyear department. What is the function of that machine and how was the operation of beating and slashing welts performed prior to its introduction? If such machine embodies mechanisms forming the subjects-matter of patents of the United Company, state the patents and state briefly the development of the art made by the United Shoe Machinery Company since 1899. If, in answering this question, you refer to any machines shown and described in Letters Patent of the United Company, name the patents.

Mr. WEBSTER. The question is objected to for that it calls for matter not referred to in the evidence presented by the petitioner before the examiner.

Ans. After the welt has been attached to the shoe by the inseam sewing operation it is curled up around the upper of the shoe, particularly around the toe, owing to the attachment of a straight strip of welting around the curved outline of the shoe. Before the out-sole can be attached to the shoe the welt must be beaten out so that it will lie in substantially one plane all around the shoe. Prior to 1899 two types of machines had been put out by the Goodyear Shoe Machinery Company for performing this operation of beating

out the welt. The earlier machine was known as "Beating Machine, Goodyear Welt", and was constructed substantially as shown and described in patent No. 320,075, June 16, 1885, Littlefield.

BEATING MACHINE: GOODYEAR UNIVERSAL WELT.

This machine, however, had been discarded before 1899 and the Goodyear Company had adopted in its place the commercial machine shown in the drawings and described in the specifications and set forth in the claims of patent No. 598,727, February 8, 1898. This machine, known as "Beating Machine, Goodyear Universal Welt", is illustrated on page 41 of Plaintiff's Exhibit No. 220, which is a copy of the catalogue of the Goodyear Shoe Machinery Company, dated January 1, 1897. The object of the improved machine of patent No. 598,727 was to enable the operator to vary the force of the blow imparted to the welt as required for different portions of the work. The curling up of the welt, to which I have referred, frequently wrinkles and bunches or thickens the welt around the toe as the natural effect of attaching a straight strip of welting around a sharply curved outline. Consequently there is the greatest need for beating, and the hardest blows are required to flatten out the welt around the curved thickened toe portion. The machine of the Littlefield patent referred to had no provision whatever for varying the force of the blow during the operation of the machine.

In the Goodyear Universal welt beating machine as shown in patent No. 598,727, above referred to, the operator was enabled instantly, by depressing a treadle, to vary the force of the blow imparted by the machine, and by imparting a harder blow in beating out the welt around the toe portion the time required for the operation on each shoe was materially lessened. The improvements illustrated in that patent No. 598,727, February 8, 1898, also included means by which the machine was made to absorb the force of the blow of the hammer instead of transmitting it through the treadle connections to the foot of the operator. A typical claim of this patent No. 598,727 is the first:—

"1. In a welt beating machine, the combination of a welt beating hammer, a table upon which the welt is placed, a movable support

therefor, a movable abutment against or upon which said table support continuously rests, bearings for said abutment which are at all times in the line of thrust of the table support, means for moving said abutment to lower the table for the introduction of the work, and a treadle connected with said abutment for moving it to raise said table to different elevations, substantially as described."

BEATING AND SLASHING MACHINE: GOODYEAR WELT.

In using the machine of Littlefield, patent No. 320,075, which machine, as already stated, had been superseded prior to 1899, it had been necessary in order to make the welt lie down flat around the toe, as is required, for the operator to slit the welt around the toe by hand on a large proportion of the shoes operated upon by the machine. While, as has been stated, the operation around the toe of the machine of patent No. 598,727, February 8, 1898, was much more satisfactory than that of the earlier machine, which it had superseded before 1899, the improved organization of the 1899 machine had not done away with the necessity of slitting the welt around the toe on a large proportion of the shoes operated upon by the machine. This operation of slitting the welt, which, in the use of the 1899 machine, as in the use of the earlier machine, had to be performed by hand, required considerable time and was a delicate operation because it was important that the slits should not extend entirely through the welt, as if they did they would be visible on the grain side of the welt, that is, its upper face, and would be placed in such a manner as to be objectionable in the finished shoe, and it was even more objectionable to have the slits extend entirely through the welt, because in that case they would impair the strength of the welt. As to the first objection, it should be noted that the welt around the toe portion of the shoe is particularly prominent in the finished shoe, particularly in modern shoes provided with extension edges.

It being recognized that the majority of shoes made required or would be improved by slitting around the toe, the United Company proceeded soon after its organization to develop a machine which would slit the welt whenever desired during the operation of the machine. The production of such a machine presented a number

of problems which had to be dealt with by the United Company's inventors. In the first place, it is usually desired to slit the welt only at the toe where the greatest difficulty is encountered in making the welt lie down flat in the beating-out operation. Furthermore, it is undesirable to slit the welt where it is not needed, that is, along the straighter portions of the welt, because the slitting naturally weakens the welt somewhat, and it is along the straighter portions at the ball that the greatest strain is exerted upon the outseam, that is, the line of stitching which secures the out-sole to the welt, in the wear of the shoe. Secondly, as just explained, the slits must not extend entirely through the welt to its upper face, because if the slit were so formed the welt would be weakened and its exposed upper face would be defaced. Thirdly, those slits must be oblique to the face of the welt and must be comparatively long so that they will overlap, and the welt be firmly secured in the out-sole stitching operation. Fourth, the hammer on the welt-beating machine must, for commercial success, be operated at a high speed. The usual practice is to operate the machine at a speed which imparts about 2000 blows to the welt per minute. This speed of operation of the hammer greatly complicated the developing of an organization which would automatically slit the welt because the knife, cutting in as it does from the edge of the thin welt, can only operate successfully while the welt is clamped, and the only manner in which the welt can be clamped is by holding it between the hammer and the work support.

A machine in which all of these problems were successfully solved was produced by the United Company and was first put out for commercial use in November, 1904. This machine, known as "Beating and Slashing Machine, Goodyear Welt", is constructed substantially as shown, described and set forth in the claims of patent No. 875,171, December 31, 1907, Hadaway.

[*Adjourned to 10 o'clock* A. M., *Thursday, October 16, 1913.*]

BOSTON, Mass., October 16, 1913.

[*Answer to Int. 87 continued:*]

In this machine the problems which I have recited were solved in the following manner: First, the machine was so organized that the operator could slit the welt at any point desired in the progressive operation of the machine around the welt. A typical claim of patent No. 875,171, directed to this organization, is the sixteenth: —

"16. A machine for operating upon welts, having, in combination, means for beating out the welt after attachment to the shoe, means for slitting the welt, and means for throwing the welt slitting means into and out of operation during the continued operation of the welt beating means, substantially as described."

The second problem above referred to, that is, the forming of the slit obliquely to the face of the welt and extending only part way through the welt, that is, forming an oblique slit which would not extend to the exposed grain surface of the welt, was solved in this new machine by an organization defined in a number of claims of patent No. 875,171, of which the first claim is typical: —

"1. A machine for operating upon welts, having, in combination, means for beating out the welt after attachment to the shoe, and means for simultaneously forming in the welt a series of slits extending partially through the thickness of the welt, substantially as described."

The third problem referred to, namely, that of forming the slits during the operation of the rapidly reciprocating hammer, was solved in this machine by an organization defined in many claims of this patent No. 875,171, of which typical claims are the 12th and 19th, as follows: —

"12. A machine for operating upon welts, having, in combination, a welt beating hammer, means for actuating the same to beat out the welt, a work support shaped to support the welt after attachment to the shoe, a welt slitting knife, and means for actuating the knife to slit the welt while the welt is clamped between the hammer and work support, substantially as described."

"19. A machine for operating upon welts, having, in combination, a welt beating hammer arranged to act on the welt after attachment to the shoe, and welt slitting means operating to make

a single cut in the welt by a plurality of forward steps, substantially as described."

It might be well to explain the organization set forth in claim 19 by referring again to the fact that the hammer of this machine is operated to strike approximately 2000 blows per minute. It would probably be impracticable to cut into the edge of the welt and make the oblique slit desired during one engagement of the hammer with the stock, and, as has been explained, it is essential that the welt be clamped during that slitting operation. This problem was ingeniously met in this machine by an organization which effected the cut by advancing the knife while it was cutting the welt in three successive steps, these steps being taken during successive engagements of the hammer with the welt.

Before leaving this patent, attention should be called to the fact that some of its claims define in broad terms the combination of a vibrating welt-beating hammer and means for slitting the welt. A typical claim is the second:—

"2. A machine for operating upon welts, having, in combination, a work support shaped to support the welt after attachment to the shoe, a vibrating welt beating hammer, means for actuating the hammer to beat out the welt, and means for simultaneously slitting the welt, substantially as described."

The hammer mechanism of this machine is defined in the single claim of patent No. 643,455, February 13, 1900, Bayley, which is as follows:—

"1. In a machine of the character described, the combination of a lever having a tubular head; a hammer having a stem extending through said head; a spring surrounding the stem within the head between shoulders of the latter and the stem; a stop nut on the stem above the head; and sound deadening or cushioning material interposed between said nut and the head."

The knife which is used in this machine for forming the slit in the welt is defined in the claims of patent No. 875,172, December 31, 1907, Hadaway. This knife is so constructed that a slit of the same length, that is, of the same dimension lengthwise of the welt, is formed in the welt, whatever the thickness of the stock. Without this improvement the slit would naturally become longer

as the stock increased in thickness. Typical claims of this patent No. 875,172, directed to this improved knife, are as follows: —

"2. A knife for welt slitting machines having a cutting edge shaped to cut slits of substantially the same length in welts of various thicknesses when the knife is laterally inclined to the surface of the welt and is reciprocated in substantially the plane of the welt, substantially as described."

"5. A knife for welt slitting machines consisting of a flat bar having a cutting edge at its end comprising two portions arranged at an angle with each other, and shaped to cut a transverse inclined slit in a welt when the knife is reciprocated longitudinally in substantially the plane of the welt, substantially as described."

The standard commercial welt-beating machine now being leased by the United Shoe Machinery Company is constructed substantially as shown in patent No. 875,171, December 31, 1907, Hadaway, and in patent No. 875,172, December 31, 1907, Hadaway.

This machine is put out by the United Company through its Goodyear department, and after its adoption in 1904 up to March 1, 1913, the end of the company's last fiscal year, 992 of these machines had been put out. One of the machines will take care of the output of four or five welt-sewing machines.

Int. 88. Have you collected in a single volume the patents to which you have referred in your last answer as relating to welt-beating machines?

Ans. Yes, sir; and I produce the volume.

[*Volume of patents relating to welt-beating machines is offered in evidence, and marked "Defendants' Exhibit 170".*]

Int. 89. Will you please give the number, date and name of patentee of the several patents contained in the volume just offered in evidence as Defendants' Exhibit 170?

Ans. No. 320,075, June 16, 1885, Littlefield.

No. 598,727, February 8, 1898, French and Meyer.

No. 643,455, February 13, 1900, Bayley.

No. 875,171, December 31, 1907, Hadaway.

No. 875,172, December 31, 1907, Hadaway.

Int. 90. What is the function of the machine to which you have heretofore referred as "Inseam Trimming Machine, Goodyear

Universal"? If that machine embodies subjects-matter of any Letters Patent of the United Company, state the patents, and also state what developments have been made in the inseam trimming art by the United Shoe Machinery Company, if any, since 1899. If such developments form the subjects-matter of any Letters Patent of the United Company, state the patents.

Mr. WEBSTER. Counsel for petitioner objects to the question and to all testimony in reference to inseam trimming machines, on the ground that no reference has been made to such machines or patents relating thereto in the testimony thus far presented by the petitioner, and that such testimony is, therefore, inadmissible, incompetent and irrelevant as having no reference to any matter presented by the petitioner, or in reply to or in defence of any evidence submitted by the petitioner.

TRIMMING MACHINE: GOODYEAR UNIVERSAL INSEAM.

Ans. After the welt-sewing operation the shoe is left with a substantial ridge projecting outwardly from the bottom of the sole, which comprises the upper stock and the edge of the channel or rib on the insole. Before the out-sole can be attached to the welt, this projecting ridge of stock must be trimmed off, as it would prevent the desired and necessary close fitting of the out-sole on the bottom of the shoe. A shoe having the welt attached, and which shows the necessity for the inseam trimming operation is shown in Defendants' Exhibit 107. Prior to February, 1899, the Goodyear Shoe Machinery Company had been leasing an inseam trimming machine which is illustrated on page 34 of Plaintiff's Exhibit No. 220, being the Goodyear Shoe Machinery Company catalogue of January 1, 1897. Only a small number of these machines was being put out by the Goodyear Company, however, and only a limited number were in use in February, 1899. At that date the inseam trimming operation was performed almost entirely by hand. In February, 1899, the inseam trimming machine being put out by the Goodyear Shoe Machinery Company, known officially as "Trimming Machine, Goodyear Universal Inseam", embodied mechanisms set forth in the claims of the following patents: —

No. 540,438, June 4, 1895, Harris.

No. 542,813, July 16, 1895, Spencer.

No. 558,379, April 14, 1896, French and Meyer.

No. 558,380, April 14, 1896, French and Meyer.

No. 558,381, April 14, 1896, French and Meyer.

No. 559,314, April 28, 1896, Spencer.

No. 590,831, September 28, 1897, French and Meyer.

Of these patents, the first, No. 540,438, shows in its drawings a machine not even remotely resembling the commercial inseam trimming machine of 1899, and the machine of that patent was not a commercial success. All of its four claims, however, set forth mechanisms embodied in the commercial machine.

Only one experimental machine was constructed as shown in the drawings of patent No. 542,813, but the first claim of that patent defines mechanisms embodied in the commercial machine of 1899.

The commercial inseam trimming machine as put out by the Goodyear Company just prior to February, 1899, was constructed substantially as shown and described in patents —

No. 558,379, April 14, 1896, French and Meyer;

No. 558,380, April 14, 1896, French and Meyer;

No. 558,381, April 14, 1896, French and Meyer;

No. 590,831, September 28, 1897, French and Meyer.

All of the seventeen claims of the first patent just enumerated, No. 558,379, April 14, 1896, defined mechanisms embodied in the 1899 machine, and retained in the machine in the different stages of its development since that time. Typical claims of this patent are the following: —

"1. In a welt seam trimming machine, a welt seam trimming knife turning on an axis, a means for holding and feeding the work, having as a co-operative part of it a device which acts upon the under side of the welt and projects inwardly and terminates close to the point where the cutting is being done, thereby entering the gradually contracted space between said knife and welt, tangent to the curvature of the knife, and holding the work directly opposite where the cutting is being done, substantially as described."

"15. In a welt seam trimming machine, the combination of feeding mechanism for the work, two work-supports as *c* and *r* located

a short distance apart to receive the welt seam between them, and a curved trimming knife crossing said space and means for moving it substantially at right angles to the progress of the work, substantially as described."

The fifth claim of patent No. 558,380 is as follows: —

"5. In a welt seam trimming machine, the combination of a work support, a pair of feeding jaws, the front jaw terminating just above the work support, and a trimming knife, substantially as described."

Claim 1 of patent No. 558,381 is as follows: —

"1. In a welt seam trimming machine, the combination of a work support at the face side of the welt, a welt seam trimming knife at the opposite side thereof having a cutting edge upon one side, means for moving it, a pair of clamp feeding jaws, and means for operating them to grip the welt, and to feed along the work against the cutting edge of the moving knife, substantially as described."

The problem of keeping always sharp the edge of the crown knife used on this machine was solved by the organization shown in the drawings and defined in the claims of patent No. 590,831. Prior to the adoption of this improvement great difficulty had been experienced in keeping the knife properly sharpened, as, owing to the severe work which it has to do and the frequent engagement of the edge with a lasting tack which had not been removed, or with the point of a lasting tack which had been broken off and remained in the stock, the operator had to spend a considerable portion of his time in sharpening the knife. The improvement of this patent No. 590,831 provided the machine with automatically operating knife-grinding mechanism which, without any attention at all from the operator, moved the grinding means intermittently into its knife-grinding position. By this improvement the knife was always kept properly sharpened and the operator lost no time in stopping the machine and grinding the knife. A typical claim of this patent No. 590,831 directed to this improvement is the first: —

"1. In a welt seam trimming machine, a grinding wheel, its shaft, a supporting frame for said shaft having a bearing in which it is free to rotate, a frame constructed and arranged to receive and support said shaft supporting frame having rods upon which

said shaft supporting frame is free to slide in the direction of the length of the shaft, means for rotating said shaft, and means for moving its supporting frame back and forth, to thereby rotate the grinding wheel and cause it to automatically travel back and forth across the beveled cutting edge of the trimming knife, substantially as described."

Another feature of the organization of the commercial machine of 1899, and of the present day, is defined in the fifth claim of this patent No. 590,831, which is as follows: —

"5. In a welt seam trimming machine, a crown knife having a flaring flange and two work supports as *c* and *r*, located a short distance apart to receive the welt seam between them, said knife working in and across said space, the work support *r* being located in front of said knife and made adjustable in and out, substantially as described."

All of the six claims of this patent No. 590,831 define mechanisms embodied in the commercial machine of 1899, and ever since.

At the time the United Company was formed, in February, 1899, there was, as I have stated, only a small number of these inseam trimming machines in use, and the inseams of nearly all welt shoes being made at that time were trimmed by hand. The chief reason why the machine had not superseded the hand operation was that the machine was not so organized as to insure that it would always perform its work properly and would not occasionally cut too deep a gouge into the inseam, which, of course, would spoil the inseam and the shoe. The operation of inseam trimming was a delicate one, because the cutting must be done as closely as possible to the inseam, and yet not so close as to damage the inseam and weaken the shoe. This requirement will be understood on inspection of Defendants' Exhibit No. 1, which is a shoe which has had its inseam trimmed, and I also produce a part of a shoe, the inseam of which has been partially trimmed on the present commercial inseam trimming machine.

[*Shoe showing partial operation of inseam trimming machine is offered in evidence, and marked "Defendants' Exhibit 171".*]

The inseam trimming machine was not a commercial success in February, 1899, and for over ten years the United Company's

inventors were engaged almost continuously in the endeavor to improve the machine so that it would trim the inseam properly and rapidly without the danger of gouging into the line of stitching. The first improvement which was sufficiently successful so that it was incorporated in the commercial machine was adopted in 1904. This improvement comprised a guide for engaging the inner edge of the welt during the operation of the machine, the object of the improvement being to limit the movement of the shoe toward the cutter, and thereby prevent the gouging of the cutter into the inseam. The improvement is defined in all of the seven claims of patent No. 788,796, May 2, 1905, Selby, of which typical claims are 1 and 5:—

"1. An inseam trimming machine, having, in combination, a trimming knife, and means for guiding a welted shoe comprising a guide arranged to bear upon the edge of the welt at one side of the upper and support the upper while being cut by the knife, substantially as described."

"5. An inseam trimming machine, having, in combination, a cylindrical trimming knife and a guide extending within the periphery of the knife arranged to bear against the edge of the welt of a welted shoe and support the upper while being cut by the knife, substantially as described."

While the improvement of the Selby patent has always, since its adoption, been embodied in the commercial machine, and while it improved the operation of the machine sufficiently so that a somewhat larger number were put into use, the machine was still far from perfect in its operation and was not yet, even with this improvement, a satisfactory commercial machine. The next improvement, resulting from the experimental work constantly being carried on with the object of perfecting the machine, was the incorporation in the machine's organization of a guide arranged to engage the insole inside of the inseam and close to it, and also close to the point of operation of the knife. This improvement, adopted in 1906, is shown in the drawings and defined in the claims of patent No. 939,498, November 9, 1909, Hawkins and Bourgeois. A typical claim of this patent is the third:—

"3. An inseam trimming machine, having, in combination, a cylindrical knife, means for guiding a shoe during the trimming

operation comprising a guard consisting of a thin sheet extending outside of the knife in close proximity thereto, and arranged to bear on the sole inside of the inseam, and a support for the guard located in front of the cutting edge of the knife arranged to support the guard close to the edge of the knife."

This improvement was incorporated in the machine from its adoption in 1906 until it was superseded in 1909 by another improvement to which I shall shortly refer. The machine as so improved in 1906 was nearer than ever before to commercial success, but it was still unsatisfactory to the majority of shoe manufacturers, and the greater number of shoes being manufactured still had their insoles trimmed by hand. In 1909, however, there were embodied in the machine improvements which so improved the quality of the work, and so thoroughly insured the machine against the danger of cutting too deep a gouge into the inseam and against the danger of injuring parts of the upper remote from the trimming knife by accidental engagement with the knife, and so increased the capacity of the machine, that for the first time in the history of the machine it could be regarded as an entirely successful commercial machine. The improvements adopted in 1909 are defined in the claims of patent No. 956,971, May 3, 1910, Johnson, and this patent, except in one respect, to which I will later refer, shows in its drawings and describes in its specifications the commercial inseam trimming machine as it is now being put out by the United Company. These improvements are defined in all of the twelve claims of this patent. Perhaps the most valuable of the improvements is the organization of the crease guide which engages the inseam in the angle between the welt and upper, and the channel guide by which they constantly grip the inseam and hold it tightly between them adjacent to the point where the knife is operating. In the machine as organized before these improvements were incorporated in it the crease guide and channel guide, although adjustable, were stationary, and there was no provision for varying thickness in the inseam, and consequently these guides did not hold and grip the inseam as tightly as was necessary for the proper operation of the machine. In the machine as improved in 1909 the channel guide is provided with a stock-engaging roll

which is held yieldingly pressed against the material of the inseam, this yielding movement toward the inseam being in the arc of a circle which is concentric with the circular-crowned knife. Typical claims of the Johnson patent No. 956,971, directed to this organization, are the first and fourth :—

"1. An inseam trimming machine, having, in combination, a trimming knife, and relatively yielding crease and channel guides for continuously engaging the crease and lip of a welted shoe to position the shoe with relation to the trimming knife, substantially as described."

"4. An inseam trimming machine, having, in combination, a cylindrical trimming knife, a crease guide arranged to enter the crease between the upper and welt of a welted shoe, a channel guide mounted to move in an arc substantially concentric with the axis of the cutter, and means for holding the channel guide against the lip of the insole during the trimming operation, substantially as described."

This organization is defined in broader terms in patent No. 877,036, January 21, 1908, Bates, of which the third claim is typical : —

"3. An inseam trimming machine, having, in combination, a trimming knife, a fixed guide arranged to engage a shoe externally, an internal guide arranged to engage the lip of the insole of the shoe continuously and co-operate with the external guide to position the shoe properly with relation to the trimming knife, and means for yieldingly holding the internal guide continuously in engagement with the lip of the insole."

The improvements of the Johnson patent also included a guard for the knife, arranged to protect the shoe in case it were accidentally tipped by the operator. A typical claim of the Johnson patent No. 956,971, directed to this guard, is the sixth : —

"6. An inseam trimming machine, having, in combination, a trimming knife, a crease guide arranged to enter the crease between the upper and welt of a welted shoe, a channel guide, and a guard arranged to engage the shoe beyond the cutting point of the trimming knife, substantially as described."

The specific form of this guard which is indicated at 14 in the drawings of the Johnson patent is not now used in the machine, as it has been superseded by an improved form of guard which is

the subject-matter of pending applications filed October 3, 1910, and May 4, 1912. Otherwise the drawings of this patent No. 956,971 show the present commercial inseam trimming machine.

The importance of the improvements which have been made in the inseam trimming machine from time to time since 1899, culminating in the improvements shown and set forth in the claims of the Johnson patent No. 956,971, may be judged from the following facts: —

During the first year after the United Company was formed only fifteen inseam trimming machines were put out; during the second year, twelve; during the third year, seventeen; and during the fourth year, only eleven. After the incorporation of the Johnson improvements together with the other improvements made since 1899, the output of the machine increased to eighty-nine during the year ending March 1, 1910; to 119 during the year ending March 1, 1911; and to 153 machines put out during the year ending March 1, 1912. On March 1, 1909, there were 158 of these machines out, although the machine had been on the market for over a dozen years; that is, during the first three years after the Johnson improvements had been incorporated in the machine more than twice as many machines were put out as had been supplied during the entire previous life of the machine up to March 1, 1909. By March 1, 1913, at the end of the company's last fiscal year, 747 machines had been put out. Under ordinary conditions an inseam trimming machine will take care of the output of three welt and turn machines.

In dwelling upon the importance of the inventions of this Johnson patent No. 956,971, I should not be understood as stating or implying that these improvements have superseded the improvements of the earlier patents which have been discussed, except the improvements set forth in the claims of patent No. 939,498, which were superseded by the improvements defined in the claims of the Johnson pateet. All of the claims which have been quoted from the other earlier patents define important features of the present commercial machine.

Since the Johnson improvements and the other more recent im-

provements referred to have been incorporated in the machine there has been a further improvement in the machine which is defined in the claim of patent No. 1,049,452, January 7, 1913, Dow.

In the endeavor to produce a still more satisfactory inseam trimming machine the United Company's inventors have been engaged for several years in experimental work which has resulted in the production of two inseam trimming machines which are now being tried out under commercial conditions. One of these machines is constructed substantially on the same lines as the present commercial machine, while the other machine is of an entirely different type.

This machine, the "Trimming Machine, Goodyear Universal Inseam", is put out by the United Company through its Goodyear department.

Int. 91. Have you collected under a single cover the patents to which you referred in your last answer relating to inseam trimming machines?

Ans. I have, and I produce a volume comprising copies of those patents.

[*Volume of patents relating to inseam trimming machine is introduced in evidence, and marked "Defendants' Exhibit 172".*]

Mr. WEBSTER. The petitioner objects to the introduction of any patents dated after the date of the filing of the petition herein.

Int. 92. Will you please give the number, date and name of patentee of the several patents contained in the volume which has just been offered in evidence as Defendants' Exhibit 172?

Ans. No. 540,438, June 4, 1895, Harris.

No. 542,813, July 16, 1895, Spencer.

No. 558,379, April 14, 1896, French and Meyer.

No. 558,380, April 14, 1896, French and Meyer.

No. 558,381, April 14, 1896, French and Meyer.

No. 559,414, April 28, 1896, Spencer.

No. 590,831, September 28, 1897, French and Meyer.

No. 788,796, May 2, 1905, Selby.

No. 877,036, January 21, 1908, Bates.

No. 939,498, November 9, 1909, Hawkins and Bourgeois.

No. 956,971, May 3, 1910, Johnson.

No. 1,049,462, January 7, 1913, Dow (application filed March 11, 1912).

Int. 93. In the list of machines given by you in your prior testimony (question No. 7) you referred to a machine, Goodyear Universal shank skiving machine, as put out by the United Shoe Machinery Company through its Goodyear department on February, 1899. State the function of such a machine and whether or not the mechanism embodied therein forms the subjects-matter of any Letters Patent of the United Company, and what improvements have been made, if any, by the United Shoe Machinery Company since 1899 in machines for skiving shanks. If such improvements form the subjects-matter of any Letters Patent of the United Shoe Machinery Company, state the patents, and state briefly the reasons for the adoption of such improvements.

SHANK REDUCING MACHINES FOR WELT WORK.

Ans. On all, or practically all, women's welt shoes, and on probably the majority of men's single-soled welt shoes, it is desired that the combined thickness of the welt and the out-sole in the shank shall be reduced at the edges of the sole on both sides. This result is, at the present time, usually secured by removing some of the stock at the edge of the out-sole in the shank under the channel lip formed during channeling operation. There is also used to a considerable extent a machine for obtaining this result by removing some of the material from the under side of the welt, that is, the face of the welt which engages the out-sole.

Some years before February, 1899, the Goodyear Shoe Machinery Company had supplied to shoe manufacturers a machine which skived, that is, removed, the stock from the flesh side of the sole before the sole was attached to the shoe. This machine was unsatisfactory, however, because the operator could only guess where he should begin and leave off the skiving operation, and when the sole was attached to the shoe it was frequently found that on one or both sides the thinner portion of the sole was either too long or too short to fit the shoe to which it was attached.

SKIVING MACHINE: GOODYEAR UNIVERSAL SHANK.

This led to the development by the Goodyear Shoe Machinery Company, before 1899, of a machine known as "Skiving Machine, Goodyear Universal Shank", which was adapted to trim off stock from the flesh side of the sole between the sole and the welt, after the sole had been cemented to the shoe preparatory to the out-seam stitching operation. This machine, which is illustrated on page 54 of Plaintiff's Exhibit 220, being the catalogue of the Goodyear Shoe Machinery Company of January 1, 1897, was the machine which was being put out by the Goodyear Company just prior to February, 1899, and which the United Company continued to put out after its formation.

That machine was constructed substantially as shown and described in patent No. 540,616, June 4, 1895, French and Meyer, and all of the eight claims of that patent define mechanisms embodied in this machine. Typical claims of this patent are the following: —

"1. In a shanking and feather edging machine, a cutter to feather edge the outer sole while on a last, a guide to hold the said cutter in a plane inclined with relation to the plane of the face of the outer sole combined with a four-motioned clamping feed, composed of a dog and an opposed member adapted to grasp said outer sole between them, the said dog working in the space between the inner side of the outer sole and the outer side of the inner sole substantially as described."

"4. The feed frame, a feed dog having its shank mounted in a guideway in said frame, and an opposed feeding member carried by said frame, combined with devices to move said frame and carry with it the said feeding dog and opposed feeding member, and to reciprocate said feeding dog independently on said frame to grasp and release the outer sole; a cutter; an interposed edge gage; and a movable spring supported carrier therefor, whereby the said edge gage may be moved to vary the quantity of the material removed from the edge of the outer sole while on the last, substantially as described."

SKIVING MACHINE: GOODYEAR SHANK WELT.

During the first few years after the oganization of the United Company it continued to put out the 1899 machine, Goodyear

Universal shank skiving machine, which had been the standard commercial machine of the Goodyear Company, but the operation of that machine was not satisfactory, because it was essential to its operation that it force apart the out-sole and the welt which had been cemented together in the sole-laying operation preparatory to the out-sole-stitching operation. With a view to producing a machine which would perform this shank-reducing operation in such manner that in the operation of the machine it would not be necessary to force apart the welt and the out-sole, the United Company proceeded with experimental work which had been begun by inventors of the Goodyear Company before the formation of the United Company. This experimental work resulted eventually in the production of a machine known as "Skiving Machine, Goodyear Shank Welt", which was first put out for commercial use in January, 1904, and which secured the desired reduction in the thickness of the combined welt and out-sole in the shank by reducing the thickness of the welt. The welt-skiving operation of this machine was performed after the welt had been secured to the shoe, but before the out-sole was stitched to the welt. A double advantage was secured over previous methods by the organization and mode of operation of this new machine. In the first place, the location of the skiving cut could be accurately determined with relation to each particular shoe, with assurance that the cut would be of just the right length for the particular shoe. In the second place, since the operation was performed before the out-sole was cemented to the shoe, the objectionable forcing apart of the out-sole and the welt which was necessary in the operation of the Universal shank skiving machine, the machine of 1899, was obviated. This new machine was so organized that the limit of operation of the trimming knife with relation to the inseam could be accurately adjusted, thus obviating any danger of injuring the inseam during the operation of the machine, and the inclination of the cut, that is, the amount of stock removed by the machine, could also be accurately determined by the adjustment. While the commercial machine is not shown in any granted patent, but is shown in the drawings and set forth in the claims of a pending application filed March 18,

1903, important mechanisms incorporated in the machine are defined in the claims of patent No. 620,205, February 28, 1899, Winkley, of which a typical claim is the first:—

"1. In a welt skiving machine, the combination with a feed roll and a combined work support and crease guide, of a skiving knife and knife supporting means, said knife supporting means having means for longitudinal, angular and vertical adjustment of the knife with reference to the combined work support and crease guide, substantially as described."

This machine, skiving machine, Goodyear shank welt, first put out in January, 1904, as has been stated, was immediately accepted by shoe manufacturers as a great advance over the Universal shank skiving machine, the machine of 1899, and the demand for the 1899 machine ceased immediately after the introduction of the new machine, which was put out in large numbers and was used on both men's and women's shoes.

REDUCING MACHINE: GOODYEAR OUTSOLE CHANNEL SHANK.

Many manufacturers of women's shoes desired, however, to reduce the combined thickness of the welt and the out-sole in the shank more than was practicable by removing the stock from the welt alone, and also some manufacturers desired to effect this reduction by removing stock from the sole alone, without skiving the welt at all. Accordingly, the United Company undertook the development of a machine by which the thickness of the sole could be reduced without the necessity of tearing away from the welt the cemented out-sole, which had been necessary in the operation of the machine used in 1899 for skiving the out-sole, as has been previously explained. As a result of experimental work looking to the production of such a machine, there was first put out for commercial use in April, 1909, a machine which was organized for removing stock from the out-sole under the channel flap. This machine is known as "Reducing Machine, Goodyear Outsole Channel Shank", and in its commercial form is shown and defined in the claims of pending applications filed March 18, 1903, and May 27, 1909, and some of the mechanisms embodied in the machine are defined in granted patents, of which one is No. 620,205,

February 28, 1899, Winkley, to which I have already referred in connection with the skiving machine, Goodyear shank welt.

Another patent which defines in its claims mechanisms embodied in this new machine of 1909 is No. 1,018,045, February 20, 1912, Goddu, granted on an application filed September 25, 1908. A typical claim of this patent is the tenth : —

"10. A shank trimming machine, having, in combination, a trimming knife adapted to trim off a portion of the edge of a shoe sole, a guide arranged to engage the channel of the outsole while on the shoe and means for adjusting the guide with relation to the knife, substantially as described."

Before this new machine was produced by the United Company and put into commercial use in April, 1909, no machine had ever before been used which was organized to remove stock from the out-sole of a shoe, and thereby thin the edge of the out-sole without tearing the out-sole away from the welt.

Both the shank welt skiving machine, introduced by the United Company in 1904, and the out-sole channel shank reducing machine, introduced by the United Company in 1909, are now being supplied to shoe manufactnrers according to their preferences, although the demand for the channel shank reducing machine is greater than the demand for the other machine. Some manufacturers of women's shoes use both machines, securing an extreme thinness in the shank of the sole by removing material both from the welt and from the sole.

Between January, 1904, and March 1, 1913, 344 of the shank welt skiving machines were put out; and between April, 1909, when the later machine was introduced, and March 1, 1913, 160 outsole channel shank reducing machines had been supplied to shoe manufacturers. The shank welt skiving machine has a capacity which enables it to operate upon the shoes the welts of which have been sewed on six welt-sewing machines, or one channel shank reducing machine will operate upon the product of five or six welt-sewing machines.

Both of those machines, skiving machine, Goodyear shank welt, and reducing machine, Goodyear outsole channel shank, are put

out by the United Shoe Machinery Company through its Goodyear department.

Mr. WEBSTER. The petitioner objects to the portion of the foregoing answer which makes reference to mechanisms not shown in patents issued prior to the filing of the petition herein.

Int. 94. Have you collected the patents referred by you in your last answer under a single cover?

Ans. Yes, sir; I produce a volume comprising those patents.

[*Patents relating to shank reducing machine for welt shoes is introduced in evidence, and marked "Defendants' Exhibit 173".*]

Mr. WEBSTER. The petitioner objects to the introduction in evidence of the patents issued after the date of the filing of the petition.

Int. 95. Will you please give the number, date and the name of patentee of the several Letters Patent in the volume which has just been offered in evidence as Defendants' Exhibit 173?

Ans. No. 540,616, June 4, 1895, French and Meyer.

No. 620,205, February 28, 1899, Winkley.

No. 1,018,045, February 20, 1912, Goddu (application filed September 25, 1908.)

WHEELING AND BURNISHING MACHINES.

Int. 96. In the list of machines submitted by you in your previous testimony (question No. 7) you referred to a machine, indenting and burnishing machine, Goodyear welt, and also to a machine, burnishing machine No. 2, Goodyear impression stitch. Please state the function of these machines, and if the mechanisms embodied therein form the subjects-matter of Letters Patent of the United Company, state the patents; also state the development in the art to which these machines relate, if any, made by the United Company since 1899. If, in answering this question, you refer to machines disclosed in Letters Patent, name the patent.

Mr. WEBSTER. The question is objected to for that it calls for matter in reference to which the petitioner has submitted no evidence, and therefore the matter called for is not in reply to, or in defence of, any matter presented by the petitioner.

Ans. The field for the two machines inquired about was created about 1905, by the introduction at that time of the new method of making welt shoes, which consisted in attaching the out-sole by a seam known as a "fudge stitch", as explained fully in my previous testimony relating to out-sole stitching machines. Prior to 1905, it was the usual practice to finish the upper face of the welt by indenting or separating the stitches on the Hadaway stitch-separating machine, but this machine was adapted particularly for use on shoes which had had their out-soles secured on the out-sole stitching machine by a seam which was exposed on the upper face of the welt, which was the way in which the shoes had been generally made prior to 1905. A shoe which has been operated upon by the stitch-separating machine is shown in Defendants' Exhibit 121. When, however, it became the more general practice to attach out-soles of welt shoes by the fudge stitch, that is, by forming a slit in the upper face of the welt and embedding the stitch of the out-seam in the slit, manufacturers no longer desired to use a stitch-separating machine on that class of work, but wished to finish the upper face of the welt by forming imitation stitch impressions in it, and then imparting a high finish to those imitation stitches by burnishing them. No machine was being supplied to shoe manufacturers in 1899 for performing the operation of stitch burnishing.

INDENTING AND BURNISHING MACHINE: GOODYEAR WELT.

To supply the demand from shoe manufacturers for a machine adapted for use under these new conditions of manufacture of welt shoes, the United Company developed, and first put out for commercial use in July, 1905, a machine known as the "Indenting and Burnishing Machine, Goodyear Welt". This machine was offered to manufacturers and was used to perform both the preliminary operation of "wheeling", that is, forming imitation stitch impressions on the upper face of the welt, and also the operation of burnishing these imitation stitch impressions after they had been formed. The machine was constructed substantially as shown in the drawings and described in the specifications of patent

No. 768,560, August 23, 1904, Casgrain, as modified by incorporating in the organization of that machine the mechanism shown and described in the claims of patent No. 906,705, December 15, 1908, Hadaway.

The majority of the twenty-five claims of patent No. 768,560 set forth mechanisms embodied in this machine. The general principle of operation of the machine is well set forth in the following typical claims of that patent: —

1. "In a machine of the class described, a leather working tool, and means for imparting to said tool while in contact with the stock a succession of rapid blows."

"8. In a machine of the class described, a stock support, a rotary tool to engage and travel over the face of the stock, and means to effect rapid relative movements of the stock support and tool toward and from each other to subject the stock to a succession of rapid blows."

The purpose of the improvements defined in the claims of patent No. 906,705, as well as the construction of the commercial machine embodying this improvement, is well set forth in the claims of that patent, of which a typical claim is the first: —

"1. A stitch indenting tool, having a grooved working face the surfaces of which are substantially plane and continuous throughout the working face of the tool and which are curved upwardly at their outer ends to prevent this portion of the working face from marring the work when the remaining portion is forced below the surface of the work, substantially as described."

The mechanism embodied in the organization of this machine which provided for presentation to the action of the tool of sole edges of widely varying classes and styles of work, is defined in claim 4 of patent No. 690,422, January 7, 1902, Hadaway. This claim is as follows: —

"4. A stitch separating machine, having, in combination, an indenting tool and actuating means therefor, a slide, a work support mounted thereon arranged to engage the bottom of a shoe sole, and means for adjusting the work support on said slide to vary the angle of inclination of the sole engaging surface, substantially as described."

For some few years after this machine, the indenting and bur-

nishing machine, Goodyear welt, was first put out it was used to perform both operations required for finishing the fudge stitched shoes; first, wheeling, that is, the making of the imitation stitch impressions, and, secondly, the burnishing of those stitch impressions. The machine was very successful in the performance of the first operation, but it was not satisfactory as a stitch-burnishing machine.

BURNISHING MACHINE, NO. 2: GOODYEAR IMPRESSION STITCH.

After the acquisition of the patents of Booth Brothers, the United Company adopted as its commercial stitch-burnishing machine the machine which had previously been put out by Booth Brothers, and then put out its first machine, that is, the indenting and burnishing machine, primarily as a wheeling machine, so that after that time the United Company's customers were supplied with the indenting and burnishing machine for wheeling, and with the Booth machine, known as "Burnishing Machine No. 2, Goodyear Impression Stitch (Booth)", for burnishing the stitches.

The superiority of the Booth machine for the stitch-burnishing operation was due largely to the fact that the stitch was burnished by a wheel shaped to fit the indentations previously made in the wheeling, which, while in contact with the stock, was reciprocated very rapidly longitudinally of the stitch impressions, thus burnishing and imparting a high finish to the upper face of the welt. The length of this reciprocating burnishing movement is about one-sixteenth of an inch, and as the machine imparts to the tool between 6000 and 7000 complete reciprocating movements a minute, each portion of the welt receives the benefit of a large number of these burnishing reciprocations. The result of the operation of this stitch-burnishing machine was shown in Defendants' Exhibits 109 and 110.

This present commercial stitch-burnishing machine of the United Company is shown in drawings and set forth in all of the thirty-nine claims of patent No. 845,939, March 5, 1907, Flynt. A typical claim of this patent is the eighth: —

"8. In a machine of the character described, a burnishing tool

formed to engage indentations arranged transversely at the edges of the stock, and means for imparting rapid polishing movements to said tool in a direction substantially lengthwise of the indentations."

In adopting this Booth burnishing machine the United Company improved its operation by embodying in it an invention previously used in the Goodyear welt indenting and burnishing machine, which is defined in three of the claims of patent No. 906,705, December 15, 1908, Hadaway, from which I have already quoted a typical claim in the portion of my testimony relating to the Goodyear welt indenting and burnishing machine.

To protect the upper from injury by transmission of heat from the tool to the upper, of which there was danger in the operation of the machine, since the burnishing tool has to be heated, usually by a gas flame, the machine was provided with the mechanism set forth in all of the 15 claims of patent No. 1,005,185, October 10, 1911, Flynt.

Both of these machines, Goodyear welt indenting and burnishing machine and burnishing machine No. 2, Goodyear impression stitch, are put out by the United Company through its Goodyear department for welt work, and through its general department to a comparatively small extent for use on McKay sewed shoes. Nineteen hundred and fifty-three of the welt indenting and burnishing machines had been put out between the date of its introduction in 1905 and March 1, 1913, while since the adoption of the Booth stitch-burnishing machine 519 of those machines have been put out.

Int. 97. Have you collected in a single cover the several patents referred to by you in your last answer as relating to wheeling and burnishing machines? If so, will you please produce such volume?

Ans. I have, and I produce the volume.

[*Volume of patents relating to wheeling and burnishing machines is offered in evidence, and marked "Defendants' Exhibit 174".*]

Int. 98. Please give the number, date and name of patentee of the several patents contained in the volume which has just been offered in evidence as Defendants' Exhibit 174.

Ans. No. 690,422, January 7, 1902, Hadaway.
